Court: United States Court of Appeals for the Eighth Circuit

Entry	Date	Proceedings and Orders
	Nov 18 1997	Petition for writ of certiorari filed. (Response due December 19, 1997)
	Dec 3 1997	Waiver of right of respondent Texas Office of Public Utility Counsel to respond filed.
	Dec 8 1997	Waiver of right of respondent Kentucky Public Service Commission to respond filed.
	Dec 9 1997	Brief of respondent GST Telecom, Inc. in support of petition filed. VIDED.
	Dec 9 1997	LODGING consisting of twelve plastic bound copies of excerpts of amici in the lower court submitted by counsel for the respondent GST Telecom.
	Dec 11 1997	Waiver of right of respondent Natl. Assn. of State Utility Consumer Advocates to respond filed. VIDED.
	Dec 12 1997	Brief of respondent California in opposition filed. VIDED.
	Dec 15 1997	Order extending time to file response to petition until December 19, 1997.
	Dec 17 1997	Waiver of right of respondent Colorado Public Utilities Commission to respond filed.
	Dec 18 1997	Waiver of right of respondents Sprint Spectrum L.P., et al. to respond filed.
	Dec 18 1997	Waiver of right of respondents Cox Communications Inc. and Vanguard Cellular System, Inc. to respond filed.
	Dec 18 1997	Brief of respondent GTE Entities in opposition filed. VIDED.
	Dec 18 1997	Brief of respondents So. New England Telephone Co. and Mid-Sized Local Carriers in opposition filed. VIDED.
	Dec 18 1997	Brief of respondent Regional Bell Companies in opposition filed. VIDED.
	Dec 18 1997	Brief of respondents State Commission Respondents and NARUC in opposition filed. VIDED.
	Dec 19 1997	Brief of respondents United States Telephone Association, et al. in opposition filed. VIDED.
	Dec 23 1997	Reply brief of petitioner MCI Telecommunications Corporation filed.
	Dec 30 1997	Motion of petitioners to expedite consideration of the petition filed.
	Dec 30 1997	Waiver of right of respondent Kansas Corporation Commission to respond filed.

QUESTIONS PRESENTED

1. Whether the Eighth Circuit, in disregard of the fundamental postulates of *Chevron U.S.A. Inc. v. Natural Resources Defense Council, Inc.*, improperly invalidated regulations promulgated by the Federal Communications Commission implementing the landmark Telecommunications Act of 1996—in particular, the FCC rule prohibiting incumbent local monopolists from engaging in discriminatory conduct against new entrants seeking to use parts of the existing local network—and thereby thwarted Congress' goal of creating competition in local markets as quickly as possible.

2. Whether, in light of the explicit grants of authority to the FCC to establish regulations to implement the requirements of the local competition provisions of the Telecommunications Act of 1996, the Eighth Circuit improperly held that the FCC exceeded its jurisdiction when it promulgated regulations implementing the pricing and other important requirements of the Act, on the theory that the regulations applied to intrastate matters relegated to the jurisdiction of state public utility commissions.

LIST OF PARTIES AND AFFILIATES

The parties to the proceedings in the Eighth Circuit are listed in the Appendix at 1a-4a, 73a-79a, 92a.

Pursuant to Supreme Court Rule 29.6, petitioners state as follows:

MCI Telecommunications Corporation is a wholly-owned subsidiary of MCI Communications Corporation. MCI has the following non-wholly owned subsidiaries: General Communications, Inc.; IFP Holdings, Inc.; ICS Communications, Inc.; Digital Network Television, Inc.; Genesys Telecommunications, Inc.; Inflight Phone Corp.; Multimedia Medical Systems, Inc.; News T Investments, Inc.; News Triangle Finance, Inc.; Pioneer Holding L.L.C.; and Security Technologies, Inc.

MCI Telecommunications Corporation ("MCI") petitions for a writ of certiorari to review the judgment of the United States Court of Appeals for the Eighth Circuit in this case.

OPINIONS BELOW

The initial decision of the Eighth Circuit reviewing the First Report and Order, *Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, CC Docket No. 96-98 (Aug. 8, 1996) ("*Local Competition Order*"), issued by the Federal Communications Commission ("FCC"), is reported at 120 F.3d 753, and is reprinted in the appendix ("Pet. App.") at 1a.[1] The subsequent decision of the Eighth Circuit granting certain respondents' petitions for rehearing is unreported, and is reprinted at Pet. App. 69a. The FCC's *Local Competition Order* is reported at 11 FCC Rcd. 15499 (1996). Relevant excerpts of that order and the accompanying regulations, codified at 47 C.F.R. §§ 51.1-51.809, are reprinted at Pet. App. 131a-353a.[2] The decision of the Eighth Circuit reviewing the FCC's Second Report and Order in its local competition rulemaking (11 FCC Rcd. 19392 (1996)) is reported at 124 F.3d 934, and is reprinted at Pet. App. 73a.

JURISDICTION

The Eighth Circuit issued its decision on rehearing and its mandate on October 14, 1997. This Court has jurisdiction under 28 U.S.C. § 1254(1).[3]

STATUTORY PROVISIONS INVOLVED

This case involves the Telecommunications Act of 1996 ("1996 Act"), Pub. L. No. 104-104, 110 Stat. 56, codi-

---

[1] Pursuant to discussions with the Clerk's Office, petitioner MCI is not filing its own appendix. Citations herein refer to the appendix filed by AT&T *et al.*

[2] Fifteen copies of the *Local Competition Order* have been lodged with the Court.

[3] The Court of Appeals had jurisdiction to review the FCC's regulations pursuant to 28 U.S.C. § 2342(i) and 47 U.S.C. § 402(a).

fied at 47 U.S.C. §§ 151-276. The most relevant provisions are reprinted at Pet. App. 93a-130a.

STATEMENT OF THE CASE

This petition seeks review of Eighth Circuit decisions vacating FCC regulations implementing the 1996 Act, a landmark statute designed "to shift monopoly [local telephone] markets to competition as quickly as possible."[4] In the 1996 Act, Congress asserted federal jurisdiction over local telecommunications matters that had previously been left to the States. Congress did so because historically the States had fostered monopoly provision of local phone service, and Congress desired a uniform national policy "promot[ing] competition in the local telephone service market." *Reno v. American Civil Liberties Union*, 117 S. Ct. 2329, 2338 (1997). To ensure *rapid* execution of that policy, Congress required the FCC to "establish regulations to implement" the Act's requirements within six months of the Act's passage. 47 U.S.C. § 251 (d)(1). The FCC met that deadline. The Eighth Circuit has now invalidated many of those regulations, crippling the prospects for local competition.

The Regulatory Structure Prior to 1996. The Communications Act of 1934 divided responsibility for regulation of telecommunications markets into well-defined (albeit overlapping) spheres: federally-regulated interstate services, and state-regulated intrastate services. 47 U.S.C. § 152. *See Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355 (1986). Under this dual jurisdiction, incumbent local exchange carriers ("LECs") historically have "been protected from competition by State and local government barriers to entry." H. Rep. at 49. In contrast, federal authorities over time promoted the development of competition in interstate markets.

The FCC first introduced competition in the market for the sale and lease of telephones (which are used for

---

[4] *See* H.R. Rep. No. 104-204, 104th Cong., 1st Sess. at 89 (July 24, 1995) ("H. Rep.").

both interstate and intrastate calls), and then for other equipment. *See Carterfone*, 13 F.C.C.2d 420 (1968). Local telephone monopolists and state public utility commissions jointly fought those efforts on the ground that the FCC had exceeded its jurisdiction by regulating equipment used for intrastate services. The courts of appeals rejected such challenges because the facilities at issue were used inseparably for both interstate and intrastate service.[5] The FCC also promoted competition in interstate long distance service. In particular, it required incumbent local monopolists to interconnect existing local networks with the facilities of the new competing long distance carriers (such as MCI) so that long distance calls could be originated and terminated.[6]

Incumbents nevertheless continued to use their control over the existing network to discriminate against competitors in ways that evaded regulatory control. To halt that anticompetitive conduct, the Department of Justice brought a landmark antitrust suit which resulted in the consent decree that broke up the Bell System. *See United States v. AT&T*, 552 F. Supp. 131 (D.D.C. 1982), *aff'd*, 460 U.S. 1001 (1983). As a result, there is now vibrant competition in the markets for telephone equipment and interstate long distance service. *See AT&T Reclassification*, 11 FCC Rcd. 3271, 3312 (1995) (noting rapid decline in long distance prices).

Notwithstanding these changes, the States persisted in preventing competition in intrastate markets. The individual telephone companies created by the break-up of the Bell System simply inherited pre-existing local monopoly franchises and continued to operate them as such. It was not until the 1990s that a few states began even to contemplate local competition, and their initiatives produced

---

[5] *E.g. North Carolina Util. Comm'n v. FCC*, 537 F.2d 787, 791-94 (4th Cir. 1976); *National Ass'n of Reg. Util. Comm'nrs v. FCC*, 880 F.2d 422, 431 (D.C. Cir. 1989).

[6] *E.g. Specialized Common Carriers*, 29 F.C.C.2d 870 (1971), *aff'd sub nom. Washington Util. Comm'n v. FCC*, 513 F.2d 1142 (9th Cir. 1975).

only very limited competitive entry in seven states.[7] By 1996, incumbent LECs still received over 99% of all local service revenues. *See* NPRM at ¶ 6 & n.13.

The 1996 Act. In the 1996 Act, Congress radically changed the balance between state and federal regulatory authority that had prevailed under the 1934 Communications Act, as well as the substantive policies that had prevailed under the old regime of state regulation. Abandoning its prior acquiesence to state-regulated local monopolies, Congress adopted new uniform *federal* requirements designed to eliminate legal and economic barriers to all forms of local telephone competition—requirements that applied to both intrastate and interstate uses of the local network. Congress expressly preempted any state laws and regulations that had prohibited, or had the effect of prohibiting, new entrants from offering intrastate telephone service. 47 U.S.C. § 253(a). Congress also adopted substantive federal requirements designed to reduce economic and practical barriers to entry by authorizing new entrants to make use of existing local networks.

The 1996 Act establishes three complementary routes new entrants can use to compete in local markets—each providing for the entrants' use of existing local networks. The first is facilities-based competition. "Interconnection" makes such competition possible. 47 U.S.C. § 251(c)(2). Once a new entrant begins constructing its own network facilities, it must be allowed to "interconnect" with the existing network so that its customers can make calls to and receive calls from the LEC's customers. Without interconnection, a new entrant would have to construct a duplicate network able to reach every home and business in a local service area. But even with interconnection, widespread competition will not develop promptly through facilities-based entry alone, because new entrants can

[7] *See Implementation of the Local Competition Provisions of the Telecommunications Act of 1996*, Notice of Proposed Rulemaking at ¶ 5, CC Docket No. 96-98, FCC 96-182 (rel. Apr. 19, 1996), 11 FCC Rcd. 14171 (1996) ("NPRM").

offer competitive service *only* to customers they reach with their own facilities. As Congress recognized, substantial facilities-based competition will not occur quickly, "because the investment necessary is so significant." *See* H.R. Conf. Rep. No. 104-458, 104th Cong., 2d Sess. at 148 (Jan. 31, 1996) ("Conf. Rep.").[8]

The Act's second route for entry is "resale." § 251 (c)(4). Incumbent LECs must permit new entrants to purchase their retail services at wholesale rates so that new entrants can compete by reselling existing services to retail customers. Resale allows quick entry, but holds the least prospect for genuine, sustained competition. Because the wholesale rate is calculated by subtracting from the retail rate the LEC's "avoided costs"—that is, the costs the LEC will not incur by virtue of not being a retailer (47 U.S.C. § 252(d)(3))—resale presents only limited opportunities for price competition. Wholesale rates will often be significantly above the forward-looking economic cost of providing service, and thus above the rates that would exist in a competitive market. Nor will new entrants be able to use resale to innovate by offering new products and services the LECs do not now provide. New entrants may only resell the exact same services the incumbent LEC offers its local customers.

The third route for entry set forth in the 1996 Act is leasing elements of the existing network. Specifically, § 251(c)(3) imposes on incumbent LECs the duty to provide to new entrants "non-discriminatory access to network elements on an unbundled basis . . . in a manner that allows requesting carriers to combine such elements in order to provide . . . telecommunications service." This method offers a significant prospect for real competitive choices for a large number of customers in the near term.

---

[8] The FCC estimated that an investment of more than $29 billion would be required today to construct local networks capable of reaching even 20% of available subscribers. NPRM, ¶ 7 & n.15.

To understand why the use of unbundled elements holds the most promise for immediate local competition, it is necessary to review the nature of the local telephone network. The basic physical architecture of the network consists of (i) the interface box attached to the outside of the home or business connecting the phone line to the wires inside the home or business; (ii) the "local loop," which is the wire that runs from the interface box at the customer's premises to the nearest switching center, known as an "end office"; (iii) the telephone "switches" in the end offices (to which the local loops connect) which are simply large computers that direct calls to their intended destinations; and (iv) "transport" facilities, which are the wires that carry calls between switches. To make the physical network function, there are other processes and capabilities, which Congress has also termed "network elements," including signaling, operator services, and the operations support systems that permit ordering, billing and repairs. 47 U.S.C. § 153(29). Many of these elements are nothing more than computer programs embedded in the switch's software.

By requiring incumbent LECs to make these network elements available on an "unbundled basis," Congress gave new entrants the flexibility to use components of the existing network in innovative ways. A new entrant can use parts of the existing network in combination with its own facilities. For example, a new entrant can install its own switches, and lease local loops and interface boxes from the incumbent LEC to reach customers' homes. Or a new entrant can rely entirely on components of the existing network, but use them to offer services the LEC does not currently offer or to compete in ways that resale does not permit. Furthermore, because the Act requires that the prices for using unbundled network elements be set at cost-based rates (47 U.S.C. §§251(c)(3), 252(d)(1)), new entrants will be able to price their offerings to consumers based on the efficient forward-looking cost of network elements, and thus will be able to drive prices to competitive levels.

In addition, the 1996 Act sets forth a detailed process for translating these substantive federal requirements into working relationships between new entrants and incumbent LECs. Incumbents must negotiate with new entrants over the terms of interconnection, access to network elements and resale. § 251(c)(1). But because monopolists are unlikely to agree to terms that will allow new entrants to take away customers, Congress gave state public utility commissions the authority to convene compulsory "arbitrations" to set terms. Given the complicity of many states in past monopolistic local markets, Congress kept state commissions on a short leash in performing this function. Section 252 specifically dictates that in resolving "any open issues" between the parties in these arbitrations, state commissions are to apply the substantive federal requirements of § 251 and the FCC's implementing regulations. § 252(c)(1). The final terms (both negotiated and arbitrated) are set forth in "interconnection agreements."[9] Congress placed tight time deadlines on this process. States are required to produce final "interconnection agreements" within 9 months of the time a new entrant first requests negotiations. § 252(b)(4)(C). Federal district courts may then review the state commissions' decisions to ensure that they conform to the Act and the FCC's regulations. § 252(e)(6).

Finally, the local competition provisions of the 1996 Act also play a critical role in the process of determining when the Bell Operating Companies (BOCs)—the incumbent LECs created by the break-up of the Bell System—will be allowed to provide long distance service in their regions. Section 271 gives the FCC the responsibility to decide when the BOCs may enter long distance markets from which they are presently barred. In doing so, the FCC must determine whether the access and interconnection provided by the BOC meets a "competitive checklist,"

---

[9] These "interconnection agreements" cover more than just "interconnection" provided by § 251(c)(2) of the Act, and include all terms related to access to unbundled elements and resale as well.

which incorporates by reference many of the requirements of §§ 251 and 252. 47 U.S.C. § 271(b)(2)(B).

The FCC Regulations. Congress directed the FCC to "complete all actions necessary to establish regulations to implement the requirements of [§ 251]" within 6 months of passage of the 1996 Act. § 251(d)(1). The need to have federal rules in effect *before* the start of the state arbitration proceedings led Congress to require the FCC to act promptly: "[I]t is important that the Commission rules to implement [the] new section 251 be promulgated within 6 months after the date of enactment, so that potential competitors will have the benefit of being informed of the Commission['s] rules in requesting access and interconnection." Conf. Rep. at 148-49.

The FCC issued regulations on August 8, 1996. Two critical components of those regulations are at issue here. First, the FCC's Order implemented the 1996 Act's requirements concerning the prices competitors pay to interconnect with the LECs network and to lease network elements. The Act requires that these prices be "just, reasonable and nondiscriminatory in accordance with the . . . requirements of this section and section 252." 47 U.S.C. § 251(c)(2), (3). Section 252, which § 251 incorporates by reference, states that rates are to be "based on the cost . . . of providing the interconnection or network element . . . includ[ing] a reasonable profit." 47 U.S.C. § 252(d)(1).[10] The regulations implementing these statutory requirements established basic pricing methodologies for state commissions to follow in establishing rates in light of particular local conditions. *See Local Competition Order* ¶¶ 618-984.[11]

---

[10] The FCC's pricing regulations also implement the statutory provisions governing resale prices and prices for transport and termination. 47 U.S.C. §§ 251(c)(4), 252(d)(2), 251(b)(5).

[11] In substance, the FCC determined that prices had to be based on the forward-looking economic cost of each of the leased elements, plus a reasonable profit. It named the pricing theory it adopted

Second, the FCC issued regulations implementing the statutory unbundling requirements of § 251(c)(3), which requires "nondiscriminatory access" to network elements. One of these FCC rules prohibited LECs from responding to a request for elements that were *already connected* in their networks by physically disconnecting those elements solely for the purpose of making it more difficult and expensive for competitors to use them. 47 C.F.R. § 51.315(b). The FCC concluded that this prohibition was compelled by the text of § 251(c)(3). *Local Competition Order* ¶ 293 ("section 251(c)(3) bars incumbent LECs from separating elements that are ordered in combination"). As the FCC explained, absent such a rule, new entrants "would be seriously and unfairly inhibited in their ability to use unbundled elements to enter local markets." *Id.*

Proceedings In the Eighth Circuit. As soon as the regulations were published, the LECs (joined by various state utility commissions on some issues) challenged them. Pursuant to 28 U.S.C. § 1407, the cases were consolidated in the Eighth Circuit. The court stayed the FCC's pricing rules, but left most other rules in place. As a result, the FCC's rules concerning interconnection and access to unbundled network elements governed ongoing arbitrations conducted pursuant to § 252, but its pricing rules did not.

The Eighth Circuit issued a decision on the merits on July 18, 1997, which it modified on rehearing on October 14, 1997. The court first held that the FCC lacked plenary authority to promulgate the regulations implementing the requirements of § 251. Although the 1996 Act expressly required the FCC "[w]ithin 6 months . . . [to] complete all actions necessary to establish regulations to implement the requirements of this section [251]," (47 U.S.C. § 251(d)(1)), the court held that this statutory command was only "a time constraint, directing the Commission to complete expeditiously its rulemaking regard-

---

"Total Element Long Run Incremental Cost," or "TELRIC," pricing. Because the Eighth Circuit ruled that the FCC lacked jurisdiction, the substance of those regulations is not at issue.

ing only the areas in section 251 where Congress expressly called for the FCC's involvement." [12]

The court then identified six narrow substantive areas of local telecommunications where, in its view, Congress explicitly authorized the FCC to regulate.[13] Outside these six areas *any* FCC action was *ultra vires*. Pet. App. 12a. Chief among the many areas over which the FCC supposedly lacks jurisdiction is price. The court held that because of "[t]he absence of any direct FCC pricing authority over local telephone service," Pet. App. 13a, the FCC had violated the "plain meaning" of the Act in concluding that it could issue pricing regulations. Pet. App. 14a-15a & n.15.

The court also held that the FCC's pricing rules were barred by § 2(b) of the 1934 Communications Act, 47 U.S.C. § 152(b), which provides that "nothing in this chapter shall be construed to apply or to give the [FCC] jurisdiction with respect to charges, classifications, prac-

---

[12] The court also rejected the FCC's reliance on its general authority under § 201(b) of the Communications Act, 47 U.S.C. § 201(b), which authorizes the FCC to "prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this Act." In the court's view, this provision (and similar provisions on which the FCC had relied (47 U.S.C. §§ 154(i), 303(r)) only authorized regulation of common carriers "engaged in interstate or foreign communication." Pet. App. 12a. Because, in the court's view, the 1996 Act concerns primarily "the rates of local intrastate phone service," which were outside the FCC's "primary directives," the court concluded the FCC had no authority under these jurisdictional provisions to implement the terms of the 1996 Act. *Id.* For similar reasons, the court also concluded that the FCC could not use its traditional enforcement authority under § 208 of the 1934 Act, 47 U.S.C. § 208, to enforce *any* of the 1996 Act's requirements in administrative complaint proceedings.

[13] Pet. App. 12a & n.10. *See* § 251(b)(2) (number portability), § 251(c)(4)(B) (prevention of discriminatory conditions on resale), § 251(d)(2) (identification of network elements), § 251(e) (numbering administration), § 251(g) (continued enforcement of exchange access), and § 251(h)(2) (treatment of comparable carriers as incumbents).

tices, services, facilities, or regulations for or in connection with intrastate communications service." Holding that Congress needs to set out "an unambiguous grant of intrastate authority to the FCC [for it] either to jump over or pass through section 2(b)'s fence," Pet. App. 17a, the Eighth Circuit concluded that in the 1996 Act Congress acted in "exactly the opposite" manner, because "the Act directly and straightforwardly assigns to the states the authority to set the prices." *Id.* The court also rejected the argument that the FCC had authority to regulate because the network elements were intended to be used inseverably for interstate as well as intrastate service under a unified regime.[14]

The Eighth Circuit then considered the substantive validity of the remaining rules it found to be within the FCC's jurisdiction. The court struck down many of the rules as inconsistent with the Act's plain meaning. In particular, the court invalidated §§ 51.315(c)-(f) of the FCC's rules, which required incumbent LECs to combine network elements in any manner requested by a new entrant, on the ground that the Act unambiguously requires the competitors themselves, not the LECs, to do the combining of network elements. Pet. App. 52a-53a.[15]

---

[14] Relying on § 2(b) the court also vacated FCC regulations concerning exemptions for rural carriers, Pet. App. 30a, the FCC's jurisdiction to hear complaints under Section 208, Pet. App. 31a-32a, and the standards for reviewing interconnection agreements entered into before the effective date of the Act, Pet. App. 34a. As to each of these regulations, the court concluded that Congress had intended the states, not the FCC, "to dictate the substantive standards" necessary to implement the Act's requirements. Pet. App. 29a-30a.

[15] The court also vacated as unreasonable or contrary to the Act's plain meaning the FCC's regulations implementing the 1996 Act's "pick and choose" provision, Pet. App. 24a-27a, rules implementing the agency's interpretation of the preemptive effect of its own regulations, Pet. App. 36a-40a, rules implementing the agency's interpretation of "the standards to determine which elements must be unbundled," Pet. App. 46a, and rules implementing the agency's

On rehearing, the court went further, vacating the one "combination" rule it had previously left standing, 47 C.F.R. § 51.315(b), the prophylactic rule against anti-competitive disconnection of requested network elements that are already connected. In the court's view, when a competitor requests two network elements that are already combined, the LEC is to "uncombine" them, and the competitors must then do the "actual [re]combining" of those elements. Pet. App. 52a-53a.

Petitioner now seeks review of the Eighth Circuit's decision denying the FCC the authority to promulgate rules to implement the full range of § 251's requirements (as well as its authority to enforce those requirements), and its decision invalidating § 51.315(b) of the FCC's rules on substantive grounds.

REASONS FOR GRANTING THE WRIT

This Court should grant certiorari because the Eighth Circuit's decision has dealt a crippling blow to the 1996 Act's principal objective: creating competition in local telephone markets "as quickly as possible." H. Rep. at 89. The 1996 Act "was an unusually important legislative enactment." *Reno v. American Civil Liberties Union*, 117 S. Ct. 2329, 2337 (1997). It sets comprehensive national policy for one of the most significant and dynamic parts of the American economy, and is intended to benefit every American home and business. The Eighth Circuit has made achieving the Act's goals all but impossible. For new entrants like MCI, the marketplace effects of the Eighth Circuit's ruling have been devasting.

1. In critical respects, the Eighth Circuit arrogated to itself the role of national telecommunications policy maker, in disregard of the "dominant, well-settled principle of federal law" requiring "[j]udicial deference to reasonable interpretations by an agency of a statute that

---

interpretation of the quality of access LECs must provide to competitors, Pet. App. 50a-52a.

it administers." *National Railroad Passenger Corp. v. Boston & Maine Corp.*, 503 U.S. 407, 417 (1992). *See Chevron USA, Inc. v. National Resources Defense Council, Inc.*, 467 U.S. 837, 842-43 (1984). For example, without any understanding of the destructive consequences its ruling would have on the prospects for local competition, the Eighth Circuit struck down § 51.315(b) of the FCC's rules—which proscribes discriminatory conduct the FCC concluded would "seriously and unfairly inhibit[]" new entrants' ability to compete using network elements. Although the court purported to act on the basis of the Act's "plain meaning," in truth the panel reached out to resolve policy issues in a manner utterly at odds with both the statutory text and Congress' goals. This aspect of the Eighth Circuit's decision "effectively has killed off local competition" in much of the local market.[16]

2. In other critical areas, the Eighth Circuit stripped the FCC of the authority to prescribe uniform national rules implementing the 1996 Act's requirements. In particular, the court refused to give effect to § 251(d)(1) of the Act, which authorizes the FCC to "establish regulations to implement the requirements of this section." 47 U.S.C. § 251(d)(1). Again purporting to rely on the Act's "plain meaning" but in fact drawing inferences from legislative silence, as well as relying on an entirely unprecedented construction of § 2(b) of the 1934 Communications Act (47 U.S.C. § 152(b)), the Eighth Circuit

---

[16] *Court Ruling May Close Door On Leasing of Network Elements by CLECs*, Communications Today, Oct. 16, 1997, quoting Anna-Maria Kovacs of Janney, Montgomery, Scott. *See also* Seth Schiesel, *Local Bells Win Another Victory To Block Rivals*, The New York Times, Oct. 15, 1997, at 1 ("The plans of long-distance telephone companies to get into local telephone markets were dealt a major blow yesterday as a Federal appeals court threw out regulations that were intended to foster competition with local telephone incumbents."). Indeed, almost 2 years after the Act's passage, incumbent LECs still control 99% of the market. *See* Yankee Group, eds., *The Unbearable Lightness of Local Competition*, White Paper Vol. 14, No. 8, (May 1997) at 1. Excerpts have been lodged with the Court.

ruled that the FCC could not prescribe regulations to implement the pricing requirements of § 251.

3. This case presents precisely the kinds of "important question[s] of federal law that ha[ve] not been, but should be, settled by this Court." Sup. Ct. R. 10(c). The Eighth Circuit's invalidation of § 51.315(b) of the FCC's rules jeopardizes the continued availability of the entry strategy holding the greatest prospect for widespread competition in the near term—unbundled network elements. The Eighth Circuit's decision to strip the FCC of much of its implementing authority is likewise having enormous effects, both in the marketplace and in the courts. Authority to interpret and implement the Act is now haphazardly dispersed: the FCC may prescribe uniform national rules for some of § 251's requirements, while others will be interpreted and applied by 50 state utility commissions, then reviewed by federal district courts in 50 states, and ultimately rationalized (if at all) only after years of appeals.

4. There is a pressing need for immediate review. The Eighth Circuit has effectively set telecommunications policy for the entire nation. Moreover, the Eighth Circuit's interpretations of §§ 251 and 252 have cast doubt on the validity of every existing arbitrated interconnection agreement between an incumbent LEC and a new entrant, and are being used by LECs to challenge those agreements in more than 70 pending cases under § 252(e)(6) of the Act. Similarly, jurisdictional disputes between the FCC and the states have already arisen in proceedings under the companion provisions of § 271 of the Act, and the scope and number of such disputes is certain to increase as the BOCs seek to enter long distance markets. Thus, the questions raised in this petition should be definitively settled now.

I. THE EIGHTH CIRCUIT'S DECISION INVALIDATING § 51.315(b) OF THE FCC'S RULES CONFLICTS WITH *CHEVRON*, AND HAS HAD A DEVASTATING EFFECT ON LOCAL COMPETITION.

Review of the Eighth Circuit's invalidation of 47 C.F.R. § 51.315(b) is urgently needed. The rule states that "except upon request, an incumbent LEC shall not separate requested network elements that the incumbent LEC currently combines." The reason for such a rule is obvious. When a *LEC* signs up a new customer, *it* does not senselessly break apart the constituent parts of its network and then piece them back together prior to providing service for that customer—and thus does not bear any cost of "recombining" the elements into a finished service. Section 51.315(b) simply placed the potential competitor in the same position as the incumbent LEC, preventing the LEC from exploiting its position as a monopoly vendor by imposing discriminatory costs on its rivals. The restriction also prevented the LEC from making interruption of service a necessary consequence of a customer's decision to change from the LEC to a competitor. Thus, § 51.315(b) simply forbade discriminatory and economically wasteful conduct on the part of incumbent LECs.

The Eighth Circuit's decision invalidating this regulation warrants review because it conflicts with this Court's decisions establishing the proper relationship between a reviewing court and an expert administrative agency charged with implementing a federal statute, and because the Eighth Circuit's overreaching has profoundly disrupted progress toward competition in local markets. These are plainly matters of national importance.

1. This was not a case in which a court could properly second-guess the FCC's policy judgment. The Eighth Circuit's decision to invalidate § 51.315(b) would have been justified only if "Congress ha[d] . . . directly addressed the precise question at issue" and if the plain terms of the statute *unambiguously foreclosed* the FCC's rule. *Chevron*, 467 U.S. at 843. *See Smiley v. Citibank*, 116

S. Ct. 1730, 1733-34 (1996). As will be shown, no fair reading of § 251(c)(3) permits such a conclusion.

a. The Eighth Circuit misread § 251(c)(3) when it concluded that the "plain meaning" of that provision barred the FCC from promulgating § 51.315(b). The court interpreted the requirement in the first sentence of § 251(c)(3) that LECs provide elements "on an unbundled basis" as meaning that LECs were to make network elements available in a physically separated form. It then construed the statement in the second sentence of § 251(c)(3) that LECs must "provide such unbundled network elements in a manner that allows requesting carriers to combine such elements in order to provide . . . telecommunications service" as meaning that Congress intended for potential competitors (not incumbent LECs) to be responsible for physically reconnecting the elements. Neither term means what the Eighth Circuit thought it meant.

Providing elements of the network on an "unbundled basis" does not mean physically splitting the network into its constituent components and providing those components in that form. Rather, "unbundle" is a pricing term uniformly defined as "to separate the charges for related products and services usually sold as a package." *Random House Dictionary of the English Language*, p. 2005 (2d Ed. Unab. 1981).[17] When Congress required incumbent LECs to offer potential competitors access to network elements "on an unbundled basis," the substance of its command was that individual parts of the network had to be *priced* and offered separately so that competitors could purchase whatever elements or combinations of elements they needed.

Just as the Eighth Circuit misinterpreted the term "unbundled" in the first sentence of § 251(c)(3), it miscon-

---

[17] *See also Webster's New Collegiate Dictionary* (Merriam, 1981), p. 1623 ("to give separate prices for equipment and supporting services; to price separately"); *American Heritage Dictionary*, p. 1315 (2d Col. Ed. 1991) ("[t]he separate pricing of goods and services").

strued the command in the second sentence that LECs "provide such unbundled network elements in a manner that allows requesting carriers to combine" them into a "telecommunications service." What the court described as the "plain meaning" of this provision is in truth an *inference* the court drew based on its patently false assumption that "unbundling" and "combining" are antonymous terms connoting physical actions taken by a LEC and a new entrant, respectively, to break apart and put back together the telephone network. The statute's text, however does not purport to allocate responsibilities in this way. It simply forbids LECs from artifically restricting the uses to which new entrants can put network elements. Indeed, the Eighth Circuit has it exactly backwards. As a result of the court's ruling, LECs may "provide such unbundled network elements in a manner that" *does not* "allow requesting carriers to combine them in order to provide . . . telecommunications service," because LECs may impose costly, needless burdens that make it impossible to use network elements in combination.

Consistent prior usage of the term "unbundled" confirms the Eighth Circuit's error. In 20 years of FCC regulations, "unbundled access" uniformly meant separate pricing—not physical separation. When the FCC required "unbundling" of telephone sets from local service, all that meant was the telephone set was priced separately, and the customer had the option of replacing it with a telephone from another source, or continuing to lease it at a separate price from the LEC. The LEC did not go to the customer's home and rip the phone set from the wall, forcing the customer to reconnect it.[18] And this was the uniform interpretation given the term when the FCC unbundled the features used to provide enhanced services,[19] and other aspects of the network used to provide

---

[18] *Second Computer Inquiry*, 77 F.C.C.2d 384, 388, 443-44 (1980), *aff'd sub nom., Computer and Communications Industry Ass'n v. FCC*, 693 F.2d 198 (D.C. Cir. 1982).

[19] *Third Computer Inquiry*, 104 F.C.C.2d 958, 1064-66 (1986) ("unbundling" means that "competitors will pay only for Basic

exchange access service. *See, e.g., California v. FCC*, 39 F.3d 919, 927 (9th Cir. 1994).

The Eighth Circuit's reading of the term "unbundled" is also irreconcilably in conflict with the 1996 Act's definition of "network elements." (47 U.S.C. § 153(29)). As the court recognized elsewhere in its opinion, network elements consist not only of the "physical parts" of an incumbent's network, but also of "features, functions, and capabilities" that do not correspond to individual, physically separate parts of the network. Pet. App. 42a-43a. For example, Congress expressly identified "signaling" as a network element. But signaling is not a physically separate part of the network; signaling is simply a network function provided through a combination of separate physical parts, including switches and transport facilities that carry signaling information. Other elements are nothing more than software instructions in a computer. When Congress commanded unbundling of such elements, it cannot possibly have intended that they be provided in physically separate form.

Thus, this was not a case in which the "plain meaning" of the statute foreclosed the agency's policy choice. Even if the Eighth Circuit's reading of the statutory text were consistent with some dictionary definitions (and the court cited none), the existence of multiple alternative dictionary definitions supporting the FCC's interpretation is enough by itself to prove that the FCC had discretion to interpret the statute as it did. *National R.R. Passenger Corp. v. Boston & Maine Corp.*, 503 U.S. 407, 418-19 (1992); *Sullivan v. Everhart*, 494 U.S. 83, 91-92 (1990).

b. The Eighth Circuit's reading of the second sentence of § 251(c)(3) also crashes head-on into the first sentence of that provision, which requires "non-discriminatory access" to network elements. Forcing competitors to take network elements on a disassembled basis when they are

---

Service Elements that they use") *vacated on other grounds by, California v. FCC*, 905 F.2d 1217 (9th Cir. 1990).

already combined in an incumbent's network "would impose costs on competitive carriers that incumbent LECs would not incur, and thus would violate the requirement under section 251(c)(3) that incumbent LECs provide nondiscriminatory access to unbundled network elements." [20]

c. Finally, there is no plausible policy justification for the Eighth Circuit's decision. The Eighth Circuit explained that its version of "unbundling" would serve to raise the cost of using unbundled elements, so that relying entirely on network elements would not become a less costly way to enter local markets than resale. *See* Pet. App. 71a (leasing of "combined" elements without additional costs associated with "recombining" would "obliterate the careful distinctions Congress has drawn" between leasing unbundled elements and purchasing local telephone service at wholesale rates for "resale" to customers).

The very articulation of such a policy rationale makes plain that the court was not simply following an unambiguous statutory text. It was instead attempting to reconcile what it perceived as conflicting statutory commands: the opportunity in § 251(c)(3) to rely entirely on unbundled elements to provide local service and the opportunity in § 251(c)(4) to resell LEC services. Even if it were the court's job to resolve such a conflict (and it is not), the conflict here is entirely manufactured. The FCC determined (once again in findings ignored by the Eighth Circuit) that there was no risk that the distinction between these two different methods of entry would be "obliterated" by its rule prohibiting discrimination in element provisioning, because the two routes of entry are quite distinct. *Local Competition Order* ¶¶ 332-334. Providers of service through combinations of elements face

---

[20] *Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, Third Order on Reconsideration, at ¶ 44, CC Docket No. 96-98, FCC 97-295, (rel. Aug. 18, 1997), *petitions for judicial review pending, U S West, Inc. et al. v. FCC*, Nos. 97-3576 et al. (8th Cir. filed Sept. 5, 1997).

risks that resellers do not. A reseller has a guaranteed margin that can be calculated in advance, since it simply purchases services its customers request, at a discounted rate. A competitor that provides service through combinations of unbundled network elements, in contrast, bears the risk that it will purchase elements to provide service, while its customers "will not demand a sufficient number of services using that facility for the carrier to recoup its costs." *Id.* ¶ 334.[21] As the FCC explained, Congress' purpose was not to "express[] a preference for one particular entry strategy," but to create alternative paths new entrants could employ "as market conditions and access to capital permit." *Local Competition Order* ¶ 12.

d. Although the Eighth Circuit's decision would appear to be clearly wrong, at the very least it is sufficiently open to question that it should not be allowed to stand as the last word in national telecommunications policy on a matter so central to implementation of the 1996 Act.

2. The consequences of the Eighth Circuit's decision invalidating § 51.315(b) vividly illustrate the wisdom of *Chevron*. The Eighth Circuit blithely ignored a specific FCC finding that "new entrants . . . would be seriously and unfairly inhibited in their ability to use unbundled network elements" absent a prohibition of the kind contained in § 51.315(b). *See Local Competition Order* ¶ 293. In so doing, the court gave incumbent LECs a ready means to shut down local competition in much of the market.

The LECs have pounced on this opportunity. Many have simply refused to process orders from potential com-

---

[21] For example, any decision by a potential competitor to provide service entirely through network elements requires the purchase of switching capabilities, including the capability to provide vertical features (such as call forwarding) that must be paid for by the potential competitor whether or not it is able to sell those capabilities to its customers.

petitors for elements in combination.[22] Others have insisted that potential competitors must now go through a costly process whenever they seek to order a combination of the local loop and a switch. Even though those elements are already connected in the existing LEC network, the LECs are insisting on disconnecting the elements from each other and forcing MCI to (1) construct a so-called "collocation cage" (with all the attendant costs of upkeep such as heating, ventilation and air conditioning) in the LEC end office containing the switch, (2) run wires from the end of the local loop and from the switch into the cage, (3) install equipment within the cage to connect the loop to the switch, and (4) employ technicians to perform that function—all to hook together wires that the incumbent arbitrarily disconnected.[23] Still other LECs have insisted that, instead of allowing MCI to perform this work, they would simply charge MCI the imputed value of what it would cost MCI to do so. All of these stratagems increase the cost to potential competitors of using unbundled elements well past the point at which it is profitable for competitors to use them to provide service.

---

[22] For example, US WEST (the monopolist serving most Western States other than California and Nevada) informed the Minnesota Public Service Commission that MCI "is precluded by the [Eighth Circuit] Court's orders and mandate from placing further orders for network elements on a combined basis." US WEST letter to Minnesota Public Utilities Commission (Oct. 24, 1997). These and other documents referred to in this paragraph have been lodged with the Clerk of the Court.

[23] For example, in filings before the New York Public Service Commission, Bell Atlantic has taken the position that in light of the Eighth Circuit's ruling a potential competitor seeking to order combinations of unbundled network elements would have to lease space and install equipment to recombine the elements. Supplemental Petition in Case No. 97-C-0271 (Nov. 6, 1997) at 26 n.29.

The 1996 Act does give new entrants a right to collocate in LEC end offices, 47 U.S.C. § 251(c)(6), but new entrants were given that right for the very different purpose of allowing new entrants to integrate their own facilities efficiently with the LECs' facilities.

The FCC predicted—again in findings ignored by the Eighth Circuit—that new entrants would be "denied a meaningful opportunity to compete" if LECS were permitted to impose these kinds of added costs. *Local Competition Order* ¶ 312. In practice the use of unbundled elements was likely the only economically feasible means of competing for major segments of the local market in the near term. The Eighth Circuit now has assured that fledgling competitors seeking to use unbundled elements in any manner will face an insurmountable competitive disadvantage.[24]

The Eighth Circuit badly miscalculated these potential consequences. The court assumed the additional costs faced by the new entrant would be those associated with gaining physical access to the existing network to put back together elements the LEC had disassembled. Bad as this is, the FCC had previously determined that incumbent LECs would never grant potential competitors access to their networks, and that "it [is] impossible for potential competitors that lack facilities and information about the incumbent's network to combine unbundled elements from the incumbents." *Local Competition Order* ¶ 293. The Eighth Circuit simply dismissed those findings, stating that the very fact of the incumbent LECs' challenge to § 51.315(b) "indicates . . . that they would rather allow entrants access to their networks than have to rebundle the elements for them." Pet. App. 53a. Just as the expert agency predicted, however, no LEC has agreed to allow MCI or other potential competitors access to its network.[25] This is precisely why the judiciary should

---

[24] Competition through *resold* services will not be enough to pry open local monopoly markets. The wholesale price of such service is simply too high, which is why, nearly two years after the 1996 Act made resale possible, few competitors are entering the market on a wide scale with resold products.

[25] For example, Southwestern Bell, the LEC serving Texas and other states in the Southwest, has recently indicated to the Texas

not second guess an expert agency on a technical policy judgment.

In view of these consequences, review is plainly warranted.

II. THE EIGHTH CIRCUIT IMPERMISSIBLY STRIPPED THE FCC OF JURISDICTION CONGRESS GAVE IT TO IMPLEMENT THE 1996 ACT.

The Court should also grant certiorari on a second, equally important question: whether the Eighth Circuit has improperly stripped the FCC of the authority Congress gave it to interpret and enforce critical requirements of the 1996 Act. In particular, the Eighth Circuit denied the FCC authority to implement the pricing requirements of § 251(c), the dialing parity requirements set forth in § 251(b)(3), the exemptions for rural carriers set forth in § 251(f), and the requirement of § 252(a)(1) that carriers submit preexisting agreements to state commissions for review. The Eighth Circuit also divested the FCC of its well-established authority under § 208 of the Act—which expressly authorizes the FCC to adjudicate complaints by "[a]ny person . . . complaining of anything done or omitted to be done by any common carrier subject to this [Act]"—to decide any issue arising under the local competition provisions of the 1996 Act, and gave that authority to state commissions despite the absence of any textual basis for doing so.

This Court should review the Eighth Circuit's jurisdictional ruling for two reasons. *First*, it conflicts with the statute and with decisions of other courts of appeals. *Second*, unless the decision is reversed, there is virtually no prospect for coherent administration of the local competition provisions of the 1996 Act.

Commission in declining to provide such access that "it has grave concerns regarding the implications of such an order on the security, integrity and reliability of its network; the quality of its service, and the privacy of its customers." Texas PUC Docket Nos. 16189 *et al.*, Brief on Eighth Circuit Alternatives, (Oct. 27, 1997) at 11, lodged with the Court.

1. a. The "plain meaning" of §§ 251 and 252 does not confine the FCC to the six narrow areas the Eighth Circuit specified. *See supra* n.13. Section 251(d)(1) expressly authorizes the FCC to "complete all actions necessary to establish regulations *to implement the requirements of this section*" within 6 months of the date of enactment. 47 U.S.C. § 251(d)(1) (emphasis added). Chief among § 251's requirements is that rates for interconnection and access to unbundled elements be "just, reasonable, and nondiscriminatory in accordance with . . . the requirements of this section and Section 252." 47 U.S.C. § 251(c)(2), (c)(3). Section 251(d)(1) does not include the qualifying language the Eighth Circuit read into it—*i.e.*, that the FCC may implement only those requirements of § 251 that the 1996 Act elsewhere gives the FCC the explicit responsibility to implement.

The Eighth Circuit went to great lengths to explain away this express grant of rulemaking authority. First and foremost, it concluded that § 251(d)(1) is merely "a time constraint," Pet. App. 12a, and not a grant of authority.[26] But it is simply not plausible to claim that § 251(d)(1) is only a time limit and not a grant of authority, when it is literally both.

Moreover, having discarded the express grant of authority supporting the FCC's issuance of implementing regulations, the Eighth Circuit faced a dilemma. Several provisions of § 251 plainly presuppose that the FCC *does* have the authority to issue rules—indicating that such authority must have been conferred by other provisions. For example, § 251(d)(2) states that "[i]n determining what network elements should be made available for pur-

---

[26] Similarly, the court held that § 201(b) of the Act merely authorizes regulations implementing the interstate requirements of federal law. But the plain language of § 201(b) authorizes the FCC to issue regulations implementing all provisions of the Act, not just those provisions dealing with interstate matters. 47 U.S.C. § 201(b) ("The Commission may prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this [Act.]").

poses of subsection (c)(3) of this section, the Commission shall consider" certain particular issues. The Eighth Circuit sought to work its way out of this dilemma by interpreting these provisions *alluding* to FCC rules as though they were express grants of authority to promulgate these particular rules. But these provisions do not use language granting rulemaking authority.

Equally suspect is the court's conclusion that § 252 of the Act divests the FCC of pricing authority. The Eighth Circuit found it significant that § 252 authorizes state commissions to "establish . . . rates" and that there is no "reference whatsoever to the FCC in the sections of the Act that directly authorize the state commissions to establish prices." Pet. App. 13a. But there is no inconsistency between authorizing the FCC to promulgate a uniform national regulation prescribing a rate setting methodology, and instructing state commissions to establish rates consistent with that methodology.[27]

The Eighth Circuit's contrary conclusion rests not on the "plain meaning" of the statutory text, but on a negative inference drawn from alleged legislative silence. This is not sufficient. Under *Chevron*, when a statutory provision is "silent or ambiguous with respect to [a] specific issue," reviewing courts must defer to the agency. 467 U.S. at 843. In any event, § 252 is not silent: it expressly instructs state commissions to resolve any "open issue" in arbitrations in accordance with "the requirements of section 251 of this title, including the regulations prescribed by the Commission pursuant to section 251." 47 U.S.C. § 252(c)(1). Congress did not need to repeat that instruction when, in the immediately following subsection, it

---

[27] Similarly, Congress plainly assumed the FCC would have the authority to issue *pricing* rules because 47 U.S.C. § 160 expressly gives the FCC the authority to forbear from enforcing regulations regarding "charges" issued pursuant to § 251(c). Obviously, Congress would not so carefully have given the FCC authority to forbear from *enforcing* regulations if Congress believed the FCC would not have authority to *issue* such regulations.

instructed state commissions to "establish any rates." 47 U.S.C. § 252(c)(2).

Finally, if the Eighth Circuit's interpretation of §§ 251 and 252 of the Act were correct, the 1996 Act's constitutionality would be called into question. In the Eighth Circuit's view, Congress delegated to state commissions not only the power to apply federal law to the particular facts in their states (that is, the power to adjudicate or "establish rates") but also the power to *make* federal law by "dictat[ing] the substantive standards" not established by Congress. Pet. App. 29a-30a.

That cannot be a proper reading of the Act. Congress may delegate lawmaking power to *federal* agencies, but only because federal agencies are supervised by the President and are thus accountable to the national electorate. But the Constitution does not authorize Congress to delegate federal lawmaking authority to *state agencies. See Printz v. United States*, 117 S. Ct. 2365, 2378, 2581 (1997) (unlawful to transfer federal executive power to "the 50 States, who are left to implement the program without meaningful Presidential control"). And, the role the Eighth Circuit gives to the states to "dictate the substantive standard[s]" of the 1996 Act would appear to be an executive function subject to this constitutional rule. *See Bowsher v. Synar*, 478 U.S. 714, 733 (1986) ("[i]nterpreting a law enacted by Congress to implement the legislative mandate is the very essence of 'execution' of the law"). This constitutional infirmity is itself a powerful reason to review the Eighth Circuit's interpretation.

b. The Eighth Circuit also has interpreted § 2(b) far more broadly than any other court has ever found appropriate, thereby drastically constricting the scope of the FCC's authority under the 1996 Act. The Eighth Circuit held that "in order to qualify for the 'unambiguous' exception to § 2(b), a statute must *both* unambiguously apply to intrastate telecommunications matters *and* unambiguously direct the FCC to implement its provisions." Pet. App. 19a (emphasis in original). The Eighth Circuit thus concluded that § 2(b) denies the FCC jurisdiction even

in areas that are expressly the subject of *federal* substantive requirements.

That reading of § 2(b) is not supported by any prior decision of any court. If left undisturbed, it would drastically curtail the FCC's ability to implement and enforce the requirements of § 251 of the Act because it forecloses the FCC from issuing interpretive regulations respecting *anything in* § 251 other than those few topics as to which the Act specifically mentions FCC regulations. *See supra* n.13. Nor is there any sense to such a restriction. Section 2(b) prevents the FCC, in the guise of exercising its *ancillary* jurisdiction, from regulating beyond the substantive reach of federal law. It has never before been interpreted to mean that the FCC's regulatory authority stops short of the substantive reach of federal law. Moreover, applying the Eighth Circuit's novel understanding of § 2(b) here converts Congress' allocation of authority between federal and state authorities under the 1996 Act into a nonsensical game of chance. Where the 1996 Act happens to make a passing reference to a particular topic of FCC regulations, the FCC may regulate. Where the Act does not, the FCC is stripped of jurisdiction—this in a statute that expressly directs the FCC to issue plenary regulations.

The Eighth Circuit's reading of § 2(b) also conflicts with numerous court of appeals' decisions holding that § 2(b) does not bar the FCC from regulating facilities inseverably used for both interstate and intrastate service. *See NARUC v. FCC*, 746 F.2d 1492, 1496-1500 (D.C. Cir. 1984); *California v. FCC*, 4 F.3d 1505, 1513-14 (9th Cir. 1993); *Puerto Rico Tel. Co. v. FCC*, 553 F.2d 694, 700 (1st Cir. 1977). Applying this previously well-accepted rule, the FCC had the authority, for example, to break the monopoly over the lease of telephone equipment, since telephones, though used predominantly for local calls, are also used for long-distance calls. The network elements that LECs must make available pursuant to § 251 are in this respect just like telephones: they are

indisputably used inseparably both for intrastate service (local service and intrastate toll service) and for originating and terminating interstate long distance calls.

The Eighth Circuit rejected the "inseverability" test used by every other circuit and created a completely different test. In its view, if a service is "fundamentally intrastate [in] nature," having only a "tangential impact on interstate service," that impact is "not sufficient to overcome the operation of section 2(b)." Pet. App. 23a. The Eighth Circuit thought it could depart from the prevailing inseverability rule because a separations process would allow the FCC to set rates for interstate uses of the local network. But Congress contemplated a single rate for *all* uses—intrastate and interstate—of the existing local network by potential competitors. § 252(d)(1). Therefore, when the Eighth Circuit denied the FCC the power to make rules, it effectively stripped the FCC of its traditional and undisputed authority over *interstate* services.

2. The local competition provisions of the 1996 Act stand at a critical juncture. The question is whether an enactment of sweeping national importance will be interpreted and administered in a coherent manner that holds some prospect of achieving Congress' purposes, or whether authority for implementing the Act will instead be dispersed haphazardly among the FCC, state commissions, and federal district courts. The Eighth Circuit's ruling has committed the nation to the latter course. It has left in place FCC rules uniformly implementing certain of the Act's requirements, while giving state commissions the authority "to dictate the substantive standards" necessary to implement other requirements, with the result that the 1996 Act now means different things in different states. Dozens of cases have been brought in federal district courts across the country pursuant to § 252(e)(6) challenging "interconnection agreements" containing these state commission decisions. In the large majority of those cases, either the prospective competitor or the incumbent

LEC has raised a challenge to the pricing methodology adopted by the state commission. Thus, the question of what pricing methodology §§ 251 and 252 allows or requires will be litigated in fora across the country, and then appealed, and the question may well remain unsettled for many years.

Far from settling the respective roles of the FCC, state utility commissions, and the federal courts, the Eighth Circuit's unprecedented analysis will lead to constant warfare over the proper scope of the FCC's authority under the 1996 Act. That is most obviously true with respect to any future regulations the FCC promulgates to implement the specific requirements of § 251. Turmoil will also reign over the FCC's authority under § 271 of the Act, the provision governing whether Bell Operating Companies will be permitted to provide interstate long-distance service to customers in their regions. Congress specifically vested the FCC with the power to decide when a Bell Company should receive such authority. Section 271 requires the FCC to decide whether a Bell Company applying for long distance authority has met the requirements of a "competitive checklist." The checklist expressly incorporates by reference many of the requirements of § 251, including its pricing requirements and other requirements the Eighth Circuit concluded the FCC lacked authority to implement. The text of § 271 plainly contemplates that the FCC will render an independent judgment whether the checklist is met in deciding whether to grant a BOC application. Yet when it does so it will necessarily have to evaluate precisely the same issues the Eighth Circuit said were committed to state commissions. Thus, every application under § 271 will trigger a fight over jurisdiction. Indeed, that is already occurring. Several states and incumbent LECs have sought mandamus from the Eighth Circuit because the FCC made an independent determination in a § 271 application as to whether the prices at issue complied with § 252(d) of the Act. That mandamus petition is still pending.

Similar jurisdictional conflicts could arise when the FCC exercises its authority under § 253(d) of the 1996 Act to preempt state actions that stand as a barrier to competition in the intrastate market. If a state adopts a pricing methodology pursuant to § 252 that prices network elements so high as to constitute a barrier to entry, the FCC could act under § 253(d) to preempt the state's decision.

These results would be antithetical to Congress' goals. The 1996 Act demanded FCC regulations within 6 months of the Act's passage precisely because Congress believed that local competition stood the best chance of developing quickly with enunciated rules in place upon which the regulated community could rely. The Eighth Circuit's decision to oust the FCC from its customary role in enforcing uniform federal policy and to substitute enforcement by a crazy quilt of competing policymakers disserves that legislative strategy. Congress' manifest intention to resolve speedily the foreseen regulatory issues is another reason strongly counseling review by this Court now.

CONCLUSION

The petition should be granted.

Respectfully submitted,

BRIEF OF RESPONDENT GST TELECOM, INC. IN SUPPORT OF PETITIONS FOR WRIT OF CERTIORARI

Respondent GST Telecom, Inc., respectfully submits this Brief in Support of the Petitions for Writ of Certiorari filed by Petitioners MCI Telecommunications Corporation; Association for Local Telecommunications Services, et al.; and Federal Communications Commission and United States of America.

OPINIONS BELOW

The opinions below are identified in the Petitions for Writ of Certiorari filed by Petitioners MCI Telecommunications Corporation; Association for Local Telecommunications Services, et al.; and Federal Communications Commission and United States of America. They are reproduced in the Petitioners' Appendix.[1]

JURISDICTION

The basis for this Court's jurisdiction is set forth in the Petitions for Writ of Certiorari filed by Petitioners MCI Telecommunications Corporation; Association for Local Telecommunications Services, et al.; and Federal Communications Commission and United States of America.

STATUTORY PROVISIONS INVOLVED

The statutory provisions involved are identified in the Petitions for Writ of Certiorari filed by Petitioners MCI Telecommunications Corporation; Association for Local Telecommunications Services, et al.; and Federal Communications Commission and United States of America. They are reproduced in the Petitioners' Appendix.

---

[1] Petitioners' Appendix (hereinafter "Pet. App.") refers to the appendix to the petition for a writ of certiorari in *AT&T Corp., et al. v. Iowa Utilities Board, et al.*, Docket No. 97-827, which seeks review of the same judgment as Petitions for Writ of Certiorari filed by Petitioners MCI Telecommunications Corporation; Association for Local Telecommunications Services, et al.; and Federal Communications Commission and United States of America, and which has been adopted by said petitioners.

STATEMENT OF THE CASE

Respondent GST Telecom, Inc. (GST), vigorously supports the various petitioners, especially the Federal Communications Commission (FCC), who have filed petitions for a writ of certiorari to undo the Eighth Circuit Court of Appeals' policy foray into the joyously dynamic and utterly technical world of competitive telecommunications. In essence, the Court of Appeals stepped into the vortex of telecommunications reform set into motion by the Telecommunications Act of 1996 (Act), Pub. L. No. 104-104, 110 Stat. 56, and, seizing upon disparate statutory elements that might have appeared comfortably traditional, apparently engaged in an act of interpretation without regard to the 1996 Act's design as a whole. Unfortunately, the Court of Appeals failed to recognize that this heavily brokered body of reform legislation more closely compares to a grand mosaic where the whole masterfully exceeds the sum of its parts.[2] *Iowa Utilities Board v. FCC*, 120 F.3d 753 (8th Cir. 1997).[3]

Consistent with Congress's general desire to "encourage the rapid deployment of new telecommunications technologies" and "secure lower prices and higher quality services for American telecommunications consumers," 110 Stat. 56, 56 (1996), the overall legislation constitutes a comprehensive plan for displacing local telephone monopolies with competition and choice. Without a doubt, the legislation also constitutes a no-nonsense ap-

---

[2] Indeed, in an *amici* filing submitted to the Court of Appeals to counterbalance a prior *amici* filing by four members of the House, six members of the House and Senate confirmed that "the Act was the product of many successful compromises among a variety of competing views and interests, and reflects the customary give and take of the legislative process." Brief of Amici Curiae Bliley, *et al.* at 3, *Iowa Utilities Board v. FCC*, 120 F.3d 753 (8th Cir. 1997) (No. 96-3321). Excerpts of the Brief have been lodged with the Court.

[3] The text of the Court of Appeals' decision has been submitted to the Court in Pet. App. at 1a-67a.

proach to catapulting a new class of telecommunications providers—competitive local exchange carriers (CLECs) —into the local exchange marketplace. Thus, Congress dramatically altered the national telecommunications landscape: it redefined the status quo through four key provisions that ended more than six decades of the old guard's co-dependence on captive rate-payers in the non-competitive local exchange environment.

The Act's key provisions (1) conferred explicit authority on the FCC to complete all actions necessary to establish regulations that would govern interconnection agreements between incumbent local exchange carriers (ILECs) and CLECs; (2) established a procedural framework requiring state public utility commissions (PUCs) to arbitrate failed interconnection negotiations between ILECs and potential competitors; (3) conferred jurisdiction on the FCC to preempt enforcement of any legal requirement that would interfere with the ability of any telecommunications service provider to provide any interstate or intrastate telecommunications service; and (4) established a basis for permitting the Bell operating companies (BOCs)—who presently qualify as the nation's preeminent ILECs—to petition the FCC for authority to provide long distance telephone services. *See, generally*, 47 U.S.C. §§ 251, 251(d)(1), 252, 253, and 271.

As the FCC and the other various petitioners have demonstrated in their petitions for certiorari, the Court of Appeals—at the behest of a consortium of ILECs and state PUCs—invalidated a number of central rules the FCC adopted pursuant to its congressional mandate to establish implementation regulations governing interconnection. Looking backwards to pre-Act rulings governed by the question of whether telephone service amounted to interstate or intrastate service, the Court of Appeals was somehow persuaded that the FCC's pricing methodology governing interconnection qualified as purely intrastate

regulation beyond the FCC's jurisdictional limits.[4] (Pet. App. at 8a-24a.) In another surprising instance, the Court of Appeals substituted its policy judgment for the FCC in vacating the so-called "pick and choose" rule, which entitled CLECs to select the more favorable terms an ILEC may have extended to other parties in prior interconnection agreements. (Pet. App. at 24a-27a.) Finally, on rehearing, the Court of Appeals vacated an FCC rule that prohibited ILECs from separating preexisting combined network elements. (Pet. App. at 70a-71a.) As a result of this most recent ruling, competitors providing service through purchased combinations of an ILEC's unbundled network elements can no longer obtain these elements on a less costly combined basis.

To avoid belaboring this Court with overly redundant briefings, respondent GST adopts and incorporates by reference the citations, arguments, and statutory and case analyses submitted in the petitions for review on certiorari by the FCC and the various other petitioners. As a respondent to the various petitions, GST mainly wishes to support and supplement the petitioners' compelling filings with a ground-level CLEC perspective as to what the Act means and why the Court of Appeals' decision warrants this Court's review.[5]

---

[4] Prior to the Act, the notion of FCC interstate jurisdiction related to long distance toll traffic that crossed state lines, while intrastate jurisdiction applied to in-state long distance toll traffic and local exchange service. On its face, the Act has blurred this "traditional" jurisdictional dividing line into extinction, as it expressly places the FCC at the helm of establishing interconnection rules to implement local exchange competition.

[5] Conducting business as a CLEC throughout the Western United States and Hawaii, GST has relied upon the dictates of the Act to deploy local exchange switches and fiber optic networks in states ranging from Idaho, to New Mexico, to California, to Hawaii, and in cities from Boise and Spokane, to Tucson and Honolulu, to name but a few. More significantly, GST epitomizes what the future of telecommunications is all about, as it integrates a full panoply of services into a "one-stop shop," where consumers obtain their local,

REASONS FOR GRANTING THE PETITIONS

The decision below presents important questions of federal law, in that the rulings of the Court of Appeals threaten to undermine congressional intent as it relates to key issues of national telecommunications policy.

I. THE COURT OF APPEALS' DECISION THWARTS CONGRESS'S LEGISLATIVE IMPERATIVE THAT THE FCC ASSUME THE CENTRAL ROLE IN IMPLEMENTING THE ACT.

First and foremost, the Court of Appeals' opinion frustrates section 251's fundamental purpose of advancing the Act's goals. Section 251—as a matter of federal law—establishes a mandatory duty requiring the ILECs to (1) provide competing carriers with nondiscriminatory network interconnection; (2) provide unbundled network elements at just, reasonable, and nondiscriminatory prices; and (3) resell services to other carriers at wholesale rates on a non-discriminatory basis. *See generally* 47 U.S.C. §§ 251(c)(2), 251(c)(3), and 251(c)(4). Even more significantly, section 251(d)(1) directs the FCC to "complete all actions necessary to establish regulations to implement the requirements" of section 251 within six months of enactment.

The plain language of section 251(d)(1), in particular, gives rise to three critical policy inferences germane to the petitions for certiorari. First, this provision imposes a no-nonsense, six-month time line that confirms Congress's commitment to fast-track implementation. For all intents and purposes, Congress ordered the FCC to embark upon an all-out, light-speed mission to promulgate a sweeping body of revolutionary regulations grounded in

---

long distance, and data services from the same carrier over the same network facilities. CLECs like GST, however, still require dominant carriers to provide reasonably priced, nondiscriminatory interconnection and unbundled network elements, so GST's customers can place phone calls to customers who subscribe to competing carriers.

technical requirements and anti-trust considerations.[6] Secondly, in commissioning the FCC, a federal agency, to promulgate the interconnection rules, Congress ordained that interconnection in the local exchange constitutes a matter of compelling national interest.

Finally, and most pertinent of all, the plain language of section 251(d)(1) unambiguously establishes the FCC as *the* regulatory body broadly empowered to complete "all actions necessary" to establish the regulations envisioned under section 251, including, presumably, the express requirements set forth at sections 251(c)(2) and 251(c)(3). Among other things, these subsections require that the ILECs provide interconnection and unbundled network elements "on rates, terms, and conditions that are just, reasonable and nondiscriminatory"—especially as they relate to the requirements set forth in sections 251 *and* 252. Thus, the Court of Appeals should not have held that the FCC exceeded its jurisdiction in establishing pricing principles relating to interconnection, as the plain language of sections 251(c)(2) and 251(c)(3), when read in conjunction with section 251(d)(1), compels the FCC to adopt such pricing standards.

For any new CLEC having to contend with unyielding ILECs and uncertain state PUCs, section 251(d)(1) presents distinctively straightforward policy implications that help to explain why Congress looked to the FCC to establish the Act's interconnection rules. Aside from its obvious goal of achieving national coherence and uniformity—and thereby avoiding regulatory fragmentation

---

[6] The six-month deadline also demolished any illusions or natural inclinations the ILECs may have had that they might somehow slow roll or otherwise retard the work of the FCC, which, in a monumental display of government alacrity and efficiency, rose to the occasion in enlightened and decisive fashion. See *In re Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, 11 FCC Rcd. 15,499 (1996) (First Report and Order) (excerpts printed at Pet. App. 131a-337a).

—in the interconnection process, the overall legislation diplomatically takes into account the likely reality that, in the wake of the Act, too many state PUCs would face capability issues that would retard the process. As it turned out, following enactment, many state PUCs found themselves underbudgeted, understaffed, uncertain and even unwilling to contend with the "paradigm shift" wrought by the Act.[7] Others made their way to the Court of Appeals to defend both their "turf" and a largely meaningless pre-Act intrastate "tradition" that no longer prevails in the post-Act era of federally imposed local competition—to say nothing of integrated telephony service providers.

Significantly, by its terms, the Act authorizes the FCC to preempt any state access or interconnection order that is inconsistent with section 251 or substantially prevents section 251's implementation. In this regard, the Act establishes a minimum federal standard relating to interconnection-related issues, which dovetails with the FCC's jurisdiction and its authority under the Act to preempt any state or local law or rule that imposes a requirement that may prohibit or have the effect of prohibiting the ability of any entity to provide interstate *or* intrastate telecommunications service. 47 U.S.C. §§ 251(d)(3), 253(a) and 253(d). Again, taken as a whole, the Act underscores the FCC's agency expertise and broad powers

---

[7] After nearly two years since enactment, some state PUCs have only fairly recently opened costs dockets relating to pricing and interconnection issues. Though such regulatory delays hardly qualify as extraordinary in a context accustomed to monopoly precepts, they are frustrating to investors and murderous to the business case of competitive companies. The Act as a whole, however, contains critical short-term deadlines, demonstrating that Congress meant business in tearing down the time barriers to entry that might impede competitive intrastate telecommunications service. Thus, instead of leaving the job to 50 state PUCs of varying degrees of commitment and ability to wrangle with it, Congress assigned the fast-track interconnection rule-making to the single federal agency with the expertise and wherewithal to ensure timely compliance.

to construe and implement the Act's interconnection requirements—whether they relate to interconnection pricing policies or to conditions surrounding unbundled access—and to construe and preempt legal and economic barriers to entry.

II. THE COURT OF APPEALS' DECISION DRAMATICALLY MISCONSTRUES THE STATES' ROLE IN IMPLEMENTING INTERCONNECTION.

While the Act at section 251 places the FCC in the central role of fashioning federal regulations and enforcing congressional intent as it relates to interconnection in both the interstate *and* intrastate contexts, Congress also saw fit to transform dramatically the role of the state PUCs. Under the old monopoly paradigm, the state PUCs served as public interest watchdogs ensuring that the ILECs spent their money prudently and enjoyed a reasonable and fair rate of return. Thus, in subjecting the monopolists to cost justification and analyzing their requests for rate increases, the state PUCs sought to keep the ILECs solvent while at the same time protecting consumers from unreasonable pricing. Over the years, under the auspices of federal regulations that established elaborate accounting procedures and cost allocation methods, the whole system evolved into a complex game of cat and mouse where the ILECs hid the cheese among reams of accounting data and an onslaught of "expert" testimony that promoted intricate and outcome-determinative methodologies for computing the desired result. One way or another, either the consumer or the taxpayer paid for this costly exercise, while the reviewing courts astutely left the whole mess to the regulators to set pricing policies and cross-examine the numbers.

Under the Act, however, the state PUCs now preside over the procedural framework that subjects the ILECs to an arbitration process if the parties fail to reach an interconnection agreement within less than six months of initiating interconnection negotiations. 47 U.S.C. § 252(b).

Still serving as public interest watchdogs, the state PUCs must now ensure that the ILECs, who enjoy lopsided bargaining power and control the local loops, do not engage in anti-competitive behavior and abuse their bottleneck control over the local exchange market.[8] As the FCC rightly contends in its petition for certiorari, the Act has linked the FCC and state PUCs in "concurrent and complementary pricing roles in fostering competition in local telephone markets." FCC Pet. at 15. In this relationship, the state PUCs must consider specific facts and issues presented for arbitration, and ensure that, in resolving any open issues and imposing conditions upon the parties to the agreement, "such resolution and conditions meet the requirements of section 251, *including the regulations prescribed by the [FCC] pursuant to section 251.*" 47 U.S.C. § 252(c)(1) (emphasis added) Thus, as other parties aptly argued to the Court of Appeals, the FCC and the state PUCs share significant collaborative partnership responsibilities in achieving the Act's goals—with the FCC establishing the overall principles that the state PUCs must apply to ensure that ILEC rates are "just, reasonable, and nondiscriminatory."

Accordingly, the Court of Appeals had no basis to limit the FCC's jurisdictional authority to fashion rules relating to the interconnection process, and should have rejected the jurisdictional issue as an unfounded collateral attack on substantive and well-grounded telecommunications policy that was squarely within both the mandate of the Act and the ambit of the agency's expertise. By convincing the Court of Appeals that the FCC's "pricing" policies jurisdictionally belonged on the "traditional" side of the intrastate equation, the ILECs and state PUCs effectively blocked the FCC from implementing interconnection and unbundling rates based on a forward-looking cost standard that represented the most just, rea-

---

[8] "Local loop" refers to the wires that extend from the carrier's switch to the customer's telephone.

sonable and nondiscriminatory basis for developing competitive markets consistent with the purposes of the Act in general, and section 251 in particular.

Even more disconcertingly, if the Eighth Circuit's decision escapes review, the ILECs will have opened the door to the historical abuses associated with playing the numbers and advocating stacked methodologies that will support the recovery of their "embedded costs"—in each and every state PUC. Many state PUCs have already adopted the FCC's forward-looking cost approach, and others will be expected to follow, but the issue will not go away, bringing about more delays and endless litigation. Thus, while the Court of Appeals may have viewed the case presented as a turf battle, its decision derailed a substantive interconnection policy, thereby impeding the Act's momentum and the nation's prospects for effective long-term competition.

III. THE COURT OF APPEALS' DECISION UNDERMINES THE BALANCE OF INTERESTS THAT CONGRESS ESTABLISHED TO ENSURE A RAPID TRANSITION TO COMPETITION.

To be sure, as part of the compromise process that surrounded the give and take of the Act's legislative genesis, the BOCs, who dominate the nation's local exchange service areas, hardly walked away from the table with hat in hand expressing melancholy regrets of Paradise Lost. To the contrary, in exchange for their cooperation in opening long-established networks and local loops to potential competitors, the Act allows the BOCs to enter the lucrative long distance business upon demonstrating compliance with the Act's competitive checklist at section 271(c)(2)(A). Given the BOCs' long-standing dominance in the local exchange market, generations of loyal local service customers will be expected to sign on as BOC long distance customers as well, giving the BOCs an extraordinary incentive to slow roll any CLEC desiring both interconnection and a slight head start in developing

market share. This provision warrants mention and the Court's consideration for two compelling reasons: first, given that the Act sets the stage for the integration of local and long distance services through the nation's dominant carrier facilities, it dispels any lingering doubt on the question of whether the Court of Appeals erred in hanging its hat on pre-Act notions of intrastate turf; second, it reinforces, once again, the time-sensitive exigencies structured into the Act and demonstrates why Congress was uncompromising in giving the FCC broad powers to get the job done.

IV. IN VACATING THE FCC'S "PICK AND CHOOSE" RULE, THE COURT OF APPEALS FRUSTRATED CONGRESSIONAL INTENT EMBODIED IN THE PLAIN LANGUAGE OF SECTION 252(i).

Finally, in throwing out the FCC's "pick and choose" rule, the Court of Appeals, responding to what it perceived as the probable carrier behavior in negotiating interconnection agreements, simply substituted its own uninformed policy judgment for Congress's due deliberation. Section 252(i) provided the FCC with the statutory basis to establish a requirement permitting CLECs to select the more favorable terms an ILEC has extended to other parties in prior interconnection agreements, but—remarkably—the Court of Appeals concerned itself with whether such an approach would "discourage the give-and-take process that is essential to successful negotiations." Pet. App. at 26a.

Section 252(i), however, plainly requires the ILECs to "make available any interconnection, service, or network element provided under an agreement approved under this section to which it is a party to any other requesting telecommunications carrier upon the same terms and conditions as those provided in the agreement." 47 U.S.C. 252(i). Petitioners have cogently explained why the Court of Appeals' interpretation constitutes a patent violation of the doctrines established by this Court in *Chevron*

U.S.A., Inc. v. NRDC, 467 U.S. 837 (1984). From a CLEC perspective, given the ILECs' superior bargaining power, bottleneck control, and consistent tendency to discriminate against new entrants, the FCC reasonably construed Section 252(i) to give new entrants the right to obtain "any interconnection, service, or network element provided under an [existing] agreement" without having to accept all other terms of such an agreement. Pet. App. at 261a-268a. Moreover, in a legislative discussion of an earlier version of section 252(i), Congress confirmed that such a requirement was, among other things, necessary to "prevent discrimination among carriers." *See* S. Rep. No. 104-23 at 21-22 (1995). Thus, to the extent that the Court of Appeals' view rests on the assumption that ILECs negotiate fairly, it reflects contextual inexperience at odds with congressional intent, the FCC's agency expertise, and this CLEC's day-to-day reality. It does lend itself, however, to the ILECs' friendly but ponderous foot-dragging—which, given their motive to delay competition, they have raised to the level of performance art.

CONCLUSION

For the reasons stated, Respondent GST Telecom, Inc., requests that the Petitions for Writ of Certiorari filed by Petitioners MCI Telecommunications Corporation; Association for Local Telecommunications Services, et al.; and Federal Communications Commission and United States of America be granted.

Respectfully submitted,

COCKLE LAW BRIEF PRINTING CO., (800) 225-6964
OR CALL COLLECT (402) 342-2831

QUESTIONS PRESENTED

1. Whether the Eighth Circuit correctly concluded, in light of the mandatory rules of statutory construction contained in Section 2(b) of the Communications Act of 1934, as amended, and Section 601(c)(1) of the Telecommunications Act of 1996, that Congress intended to preserve the role of the States and the dual jurisdictional scheme for telecommunications regulation by conferring on the States authority over intrastate pricing, dialing parity and other requirements of the 1996 Act, except where the Act expressly confers authority over such intrastate requirements on the FCC.

2. Whether the Eighth Circuit correctly concluded that the FCC's "pick and choose" rule, which was stayed and later vacated by the Eighth Circuit because it impeded free and unfettered negotiation between incumbent local exchange carriers and competitive local exchange carriers concerning the terms and conditions of interconnection, is inconsistent with the language, purposes and structure of the 1996 Act.

3. Whether the Eighth Circuit correctly concluded that the FCC rule which would in all cases have required incumbent local exchange carriers to recombine on request unbundled network elements purchased by competitive local exchange carriers is inconsistent with the language, purposes and structure of the 1996 Act, where the rule would have permitted competitive local exchange carriers engaging in resale to avoid paying resale prices and where there exist numerous remedies under the Act to redress specific instances in which an incumbent local exchange carrier takes action which impedes competitive entry.

QUESTIONS PRESENTED – Continued

4. Whether when Congress enacts a dual jurisdictional scheme establishing separate spheres of authority for "expert" Federal and State regulatory agencies, the Federal agency is entitled to *Chevron* deference with respect to determinations it makes that are within the State agency's sphere of authority or that address the line between the two spheres of authority.

Rulemaking on the Commission's Own Motion to Govern Open Access to Bottleneck Services and Establish a Framework for Network Architecture Development of Dominant Carrier Networks, CPUC Rulemaking No. 93-04-003, ALJ Ruling (Mar. 4, 1997) 9

STATEMENT OF CALIFORNIA

The People of the State of California and the Public Utilities Commission of the State of California (hereinafter collectively "California") are the sole State parties that challenged both the FCC's *First Report and Order*[1] and its *Second Report and Order*[2] and hence are the sole State respondents who prevailed in both Eighth Circuit cases below. California, which initiated its transition to local telephone competition in 1993, has an immense interest in bringing fair and effective local competition to its 32 million citizens as soon as possible. In addition, in California virtually *every* telephone call which is subject to the dialing parity rules contained in the *Second Report and Order* is intrastate in nature. California files this separate brief in opposition in both cases because of its unique interest and perspective.

STATEMENT OF THE CASE

Congress enacted the Telecommunications Act of 1996[3] to open all local telecommunications markets to competition. The Act established a set of duties with which incumbent local exchange carriers were required to comply and identified the functions, features and services that incumbent local exchange carriers were required to make available to competing local exchange carriers, as well as the mutual duties of carriers to each

---

[1] Pet. App. 131a, *et seq.*

[2] Pet. App. 338a, *et seq.*

[3] Pub. L. No. 104-104, 110 Stat. 56 (Feb. 8, 1996), *codified at and amending* the Communications Act of 1934, 47 U.S.C. §§ 151, *et seq.*

other. 47 U.S.C. § 251.[4] It authorized carriers to negotiate agreements relating to the terms and conditions upon which interconnection, resale and the purchase of unbundled network elements would occur in order to allow the competing carrier access to the incumbent's network. § 252. To the extent that such negotiations were unsuccessful, it authorized State commissions to arbitrate and resolve disputes, and it permitted aggrieved carriers to appeal State commission determinations to Federal district courts. *Id.* Only if a State commission failed to carry out its responsibility under § 252 was the FCC empowered to "assume the responsibility of the State commission. . . . " § 252(e)(5).

The 1996 Act did not fundamentally alter the dual State/Federal jurisdictional scheme established by Section 2(b) of the 1934 Act, 47 U.S.C. § 152(b). By leaving § 2(b) intact when it passed the 1996 Act (with narrow and limited exceptions), Congress preserved the FCC's broad authority over "interstate" matters but also continued to fence off from FCC reach and regulation "intrastate" matters which fall within the exclusive authority of the States.

Nevertheless, with the enactment of the new law, the FCC saw opportunity. It issued its epic *First Report and Order* which tore asunder the dual jurisdictional scheme wrought by Congress by asserting FCC jurisdiction over intrastate matters that Congress reserved to the States, dictated a single methodology for the intrastate (and interstate) pricing of local competition services

---

[4] Unless otherwise stated, statutory references are to the 1934 Act, as amended by the 1996 Act. *See* Note 3, *supra*.

nationally which it required the States to employ,[5] deputized the States to carry out its policies, and appointed itself the court of review of all State actions.[6] It simultaneously issued its similarly lengthy *Second Report and Order* which arrogated to itself the power to dictate to the States the standards for intraLATA dialing parity, even though almost every telephone call in the United States which is subject to those standards is intrastate in nature.[7]

Thirty-three States, along with other parties, challenged the FCC's opportunistic seizure of authority in the United States Court of Appeals for the Eighth Circuit. Some sought a stay of the FCC's pricing and "pick and choose" rules pending decision on the merits, and the Eighth Circuit granted the stay. *Iowa Utils. Bd. v. FCC*, 109 F.3d 418 (8th Cir. 1996). On motions to vacate the stay filed by the petitioners herein, which raised the very same arguments which they now raise in their petitions for certiorari (in many cases those arguments

---

[5] It did so despite significant differences in evolving local markets and network investment, and in derogation of proceedings in numerous States, including California, which had begun the process of transitioning to local telephone competition several years before the 1996 Act was conceived.

[6] Pet. App. 30a-34a.

[7] The rules for interLATA or long distance dialing parity were established more than a decade ago following the AT&T divestiture, leaving the sole question the appropriate dialing parity rules for intraLATA calls (both local and toll). It was undisputed below that *no* measurable percentage of intraLATA calls (local and toll) associated with California LATAs is interstate in nature, and that nationally .002, or approximately 2 out of every 1000 intraLATA calls (local and toll), are interstate in nature. Moreover, a scant two per cent of intraLATA *toll* calls are interstate in nature.

are taken verbatim from their applications to vacate the stay), this Court unanimously declined to disturb the ruling, rejecting petitioners' claims that there was a "reasonable probability" that four members of the Court would vote to grant certiorari, a "significant possibility" of reversal of the Eighth Circuit's decision and "a likelihood" of irreparable harm arising from the decision. *See FCC v. Iowa Utils. Bd.*, 117 S. Ct. 378 (No. A-299 Oct. 31, 1996) (Thomas, J., in chambers), 117 S. Ct. 429 (No. A-299 Nov. 12, 1996) (per curiam).

After full briefing and argument, the Eighth Circuit rendered its final decision, fully consistent with its earlier stay ruling, vacating portions of the *First Report and Order* and associated FCC regulations. *Iowa Utils. Bd. v. FCC*, 120 F.3d 753 (8th Cir. 1997). Shortly thereafter, the Eighth Circuit rendered its final decision vacating portions of the *Second Report and Order* and associated FCC regulations. *California v. FCC*, 124 F.3d 934 (8th Cir. 1997). The court of appeals decisions restored the dual jurisdictional scheme, upholding State authority over intrastate pricing and dialing parity standards, and vacated the FCC's "pick and choose" rule. On rehearing in the *Iowa Utils. Bd.* case, the court of appeals also vacated the FCC's regulation requiring incumbent local exchange carriers to recombine unbundled network elements on the request of a competing local exchange carrier. Pet. App. 69a.

The decisions of the court of appeals cure the jurisdictional maladies of the FCC's orders, effectuate clear congressional intent, and engender a workable blueprint for the ongoing transition from regulation to local telephone competition.

These petitions for certiorari follow.

REASONS FOR DENYING THE PETITIONS

The Telecommunications Act of 1996 may be "an unusually important legislative enactment," *Reno v. ACLU*, 117 S. Ct. 2329, 2337 (1997), but that observation does not address the standards for this Court's exercise of its certiorari jurisdiction. In attempting to address those standards, the petitioners argue that certiorari should be granted because the Eighth Circuit's decisions are incorrect, there is a conflict between the circuits, and there may never be another opportunity for any court to address the issues presented.

a. The claim that the court of appeals' decisions are incorrect is unmeritorious. It was the FCC's *First Report and Order* and *Second Report and Order*, both of which usurped State authority over intrastate matters by reading § 2(b) out of the Act, that erred. Indeed, Congress considered including provisions that would have made § 2(b) inapplicable to the local competition portions of the Act but affirmatively deleted those provisions from the final version of the statute. *See* Pet. App. 18a n. 17. There is, however, no necessity for this Court's advertence to legislative history. Section 2(b) itself, which Congress left intact, is unambiguous in providing that "*nothing* in this chapter shall be construed to apply or to give the [FCC] jurisdiction with respect to . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communications service" (emphasis added). Thus, as the court of appeals correctly found, in the absence of clear statutory language overriding § 2(b) with respect to particular provisions of the 1996 Act, the section applies.

A further pronouncement of Congress also compels this view. In § 601(c)(1) of the 1996 Act (enacted and

signed into law but not codified), Congress provided: "This Act shall not be construed to modify, impair, or supersede Federal, State, or local law unless expressly so provided in such Act or amendments." This provision, which like § 2(b) is a mandatory rule of statutory construction, demonstrates that § 2(b), except where *expressly* modified, impaired, or superseded, remains in full force and effect. It also demonstrates that State authority to regulate intrastate telecommunications under *State* law, except where *expressly* modified, impaired, or superseded, similarly remains in full force and effect. The facial language of the statute accordingly supports the Eighth Circuit's conclusions. *Accord, Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355, 368-370, 374 (1986).

The petitioners press their claim that the so-called impossibility or inseverability exception to § 2(b), *see Louisiana*, 476 U.S. at 375-376 n. 4, precludes the applicability of § 2(b) to the local competition provisions of the Act. This argument is patently without merit. Not only was it *not* a stated basis for the FCC's decisions below, *see SEC v. Chenery Corp.*, 332 U.S. 194, 196 (1943); *Burlington Truck Lines v. United States*, 371 U.S. 156, 168-169 (1962), but it is flatly refuted by the FCC's *ONA Reconsideration Order*, 5 FCC Rcd 3084 (1990), *reversed on other grounds sub nom. California v. FCC*, 4 F.3d 1505 (9th Cir. 1993), in which the FCC required, and the Ninth Circuit upheld, dual Federal/State tariffing of basic network elements, the very sort of network elements at issue in this case. 4 F.3d at 1513, 1515. The *ONA Tariffing* decision flies in the face of the new-found assertion by the FCC that Federal regulation of the intrastate component of unbundled network elements is compelled by necessity. Indeed, as noted by the

court of appeals below, ratemaking is inherently severable. Pet. App. 20a. This Court has agreed. *Louisiana*, 476 U.S. at 375.

Nor is there an inseverability issue with respect to dialing parity requirements, even though dialing parity does not involve rates. Again, the FCC did not rely on inseverability in the *Second Report and Order*. Moreover, the *Second Report and Order*, at ¶ 37,[8] itself acknowledges that dialing parity rules can be separated into interstate and intrastate components. In addition, the FCC's interest in imposing dialing parity rules which would apply to intraLATA calls which are 99.8 per cent intrastate in nature (100 per cent in California) is obviously *de minimis*. *See* Note 7, *supra*. Notably, in other contexts, the FCC itself has held that the Federal interest in regulating service which involves less than ten per cent interstate traffic is *de minimis*.[9] *Decision and Order, In the Matter of MTS and WATS Market Structure*, 4 FCC Rcd 5660 (1989), at ¶ 2, *adopting Recommended Decision and Order, In the Matter of MTS and WATS Market Structure*, 4 FCC Rcd 1352 (1989).

---

[8] Paragraphs 31-96 of the *Second Report and Order*, which deal directly with the FCC's dialing parity requirements and the jurisdictional issue they implicate, are conspicuously absent from the Petitioners' Appendix. For the Court's convenience, California reproduces ¶ 37, which it has cited, in the appendix to this brief at App. 1-2.

[9] Approximately 92 per cent of all telephone calls made nationally are intrastate in nature. Statistics of Communications Common Carriers (FCC, 1994), at p. 22. Indeed, in 1993 there were nearly twice as many intrastate telephone calls made in California (68+ billion) as there were interstate calls made in the entire United States (38+ billion). *Id.* Thus the FCC's construction of the Act would leave a very thin interstate tail wagging a very substantial intrastate dog.

Finally, the FCC's inseverability claim ignores repeated holdings that the exception to § 2(b) is "a limited one." *California v. FCC*, 905 F.2d 1217, 1243 (9th Cir. 1990). Where such a claim is properly asserted, the FCC bears the burden, plainly not satisfied here, "of justifying its *entire* preemption order by demonstrating that the order is narrowly tailored to preempt *only* such state regulations as would negate valid FCC regulatory goals." *Id.* (emphasis in original); *accord, California v. FCC*, 75 F.3d 1350, 1359 (9th Cir.), *cert. denied*, 116 S. Ct. 1841 (1996) (FCC bears burden of demonstrating negation); *NARUC v. FCC*, 880 F.2d 422, 430 (D.C. Cir. 1989) ("The FCC has the burden . . . of showing with some specificity that [state regulation] . . . would negate the federal policy. . . . "). As noted, the FCC never even addressed inseverability in its orders below.

Nor is there merit to the claim that the Eighth Circuit erred in invalidating the FCC's "pick and choose" rule. The Court has already implicitly rejected that claim in upholding the court of appeals' stay of the rule. *Iowa Utils. Bd. v. FCC, supra*, 109 F.3d at 423. The Eighth Circuit correctly concluded below that by "discourag[ing] the give-and-take process that is essential to successful negotiations," Pet. App. 26a, the "pick and choose" rule "would thwart the negotiation process and preclude the attainment of binding negotiated agreements." *Id.* This commonsense proposition is obviously correct and hardly presents a weighty question worthy of the Court's review.

Nor is there merit to the claim that the Court should grant certiorari because the Eighth Circuit erred in invalidating the FCC's rule requiring incumbent local exchange carriers to recombine unbundled network elements on request. Pet. App. 70a-71a. The FCC regulation

invalidated by the Eighth Circuit would *in all cases* have permitted competitive exchange carriers engaging in resale to avoid resale prices and to purchase services for resale at unbundled network element prices, a possibility that could have severely undermined State pricing determinations under the Act. This, the Eighth Circuit concluded, "would obliterate the careful distinctions Congress has drawn in subsections 251(c)(3) and (4) between access to unbundled network elements on the one hand and the purchase at wholesale rates of an incumbent's telecommunications retail services for resale on the other." Pet. App. 71a. While the Eighth Circuit's invalidation of the FCC's regulation plainly has a well-reasoned basis, the question presented to this Court is merely whether the broad mandatory requirement of the FCC's regulation was valid, not whether States, under their authority to impose and enforce competitive cost-based pricing of access to unbundled network elements and resale, might permissibly impose a similar requirement in generic proceedings or individual adjudications. Indeed, long before the Eighth Circuit invalidated the FCC's regulation, the California Public Utilities Commission noted the issue and preserved the possibility of addressing it, should the Eighth Circuit so rule and this Court deny certiorari. *See Rulemaking on the Commission's Own Motion to Govern Open Access to Bottleneck Services and Establish a Framework for Network Architecture Development of Dominant Carrier Networks,* CPUC Rulemaking No. 93-04-003, ALJ Ruling (Mar. 4, 1997), at 9-12.[10] The State of Connecticut is presently considering the same issue. *See Application of*

---

[10] *See* App. 3-7.

MCI Telecommunications Corp. for Arbitration Pursuant to Section 252(b) of the Telecommunications Act of 1996, Connecticut Dept. of Pub. Util. Control Docket No. 96-0909, Reply Letter of MCI dated Nov. 21, 1997.[11] In fact, MCI has represented to the Connecticut commission that the States of Ohio and Texas have already addressed the issue as a matter of State law. *Id.*

The methods which States may devise to deal with the two countervailing problems of a reseller's evading resale prices and an incumbent's provision of network access in a way that imposes undue costs on competitive entry are not yet before the Court. While it is hard to see how the Eighth Circuit's invalidation of the FCC's insufficiently considered regulation presents a question of monumental public concern, related issues which have in fact arisen in State commission arbitration and other proceedings may at some time present questions worthy of this Court's review. In any event, contrary to the petitioners' puffed arguments, it can hardly be said that the FCC's blunderbuss regulation is the *sine qua non* of local telephone competition.

Indeed, from the perspective of the States, the court of appeals gave the FCC far more than it deserved by according the agency's interpretation of the statute *Chevron* deference.[12] Pet. App. 8a. In the first place, *Chevron* deference is inappropriate where, as here, the statutory language is clear on its face. Even more importantly, however, when Congress enacts a dual jurisdictional scheme establishing separate spheres of authority for

---

[11] *See* App. 8-13.

[12] *Chevron U.S.A., Inc. v. NRDC*, 467 U.S. 837 (1984).

"expert" Federal and State regulatory agencies, the Federal agency must not be accorded *Chevron* deference with respect to determinations it makes that are within the State agency's sphere of authority or that address the line between the two spheres of authority. In such circumstances, according the Federal agency *Chevron* deference may give it a license to expand its authority beyond the limit intended by Congress.

That was precisely the situation in *Louisiana*, 476 U.S. at 374-375, where *Chevron* deference was *not* accorded to the FCC. The Court simply stated: "An agency may not confer power upon itself. To permit an agency to expand its power in the face of a congressional limitation on its jurisdiction would be to grant to the agency power to override Congress. This we are both unwilling and unable to do." This case, more than most, demonstrates that where a dual scheme is involved, *Chevron* deference is never appropriate because the agency receiving the deference may use it to upset the statutory balance established by Congress. *See, e.g., Northwest Central Pipeline Corp. v. Kansas Corp. Comm'n*, 489 U.S. 493, 512, 515-516 n. 12 (1989); *Altamont Gas Transmission Co. v. FERC*, 92 F.3d 1239, 1246-1248 (D.C. Cir. 1996), *cert. denied sub nom. Indicated Expansion Shippers v. FERC*, 117 S. Ct. 1568 (1997); *Clark v. Alexander*, 85 F.3d 146, 152 (4th Cir. 1996); *but see Mississippi Power & Light Co. v. Mississippi ex rel. Moore*, 487 U.S. 354, 380-381 (1988) (Scalia, J., concurring in the judgment) (suggesting that *Chevron* deference should extend to an agency's determination of the scope of its own authority). Stated another way, by retaining § 2(b) in the Act, Congress

legislatively determined that *Chevron* deference is inapplicable to the FCC's expansive determination of its own jurisdiction.

b. With respect to a purported conflict between the circuits, there is none. The Solicitor General effectively concedes this point by arguing that the Eighth Circuit's decisions "conflict *in principle* with the decisions of other federal circuits." FCC Pet. 11 (emphasis added). Indeed, the only cited court of appeals case which construes the 1996 Act is *Illinois Pub. Telecommunications Ass'n v. FCC*, 117 F.3d 555, 561-562, *clarified on other grounds on reh'g*, 123 F.3d 693 (D.C. Cir. 1997). FCC Pet. 17. That case holds that a provision of the 1996 Act "should not be read to confer upon the FCC jurisdiction over [intrastate matters] unless [the provision] is 'so unambiguous or straightforward so as to override the command of § 152(b).' " The jurisdictional rulings below are completely in harmony with this formulation, *compare id. with* Pet. App. 16a, and fully consistent with *Louisiana* and its progeny. There is simply no conflict.

c. Finally, the petitioners argue that certiorari should be granted because the Court will likely have no future opportunity to address the scope of the FCC's statutory authority. First, this assertion is speculative; there must be a *current* necessity for the Court's exercise of its certiorari power. Second, this Court has *already* looked at these questions and has rejected the very arguments raised in the petitions for certiorari in ruling on the applications to vacate the Eighth Circuit's stay of the pricing and "pick and choose" rules. Third, issues of preemption and jurisdiction under the 1996 Act have persistently arisen in appeals of FCC decisions, and there is no reason to suppose they will not continue to do so. *See, e.g., Iowa Utils. Bd. v. FCC, supra*, Pet. App.

1a-67a (appeal of FCC's *First Report and Order* under the 1996 Act); *California v. FCC, supra*, Pet. App. 73a-91a (appeal of FCC's *Second Report and Order* under the 1996 Act); *Illinois Pub. Telecommunications Ass'n v. FCC, supra*, 117 F.3d 555 (appeal of FCC's pay phone order under the 1996 Act); *Texas Office of Public Utility Counsel, et al. v. FCC* (5th Cir. Nos. 97-60421, *et al.* Pet. for Review filed June 25, 1997) (appeal of FCC's universal service order under the 1996 Act). Fourth, appeals from the rulings of the district courts on arbitration appeals pursuant to § 252(e)(6) will reach the courts of appeals, permitting unfettered review of jurisdictional issues raised in those proceedings despite the Hobbs Act, 28 U.S.C. § 2342(1).[13] And fifth, there is no reason to suppose that district courts will not defer to the Eighth Circuit's decisions if certiorari is denied. The question is not whether a denial of certiorari will deprive the Court of a future opportunity to address the issues in this case, but whether a grant of certiorari is presently necessary to settle those issues. It is not.

In the final analysis, this case is fundamentally the same as *Louisiana*. There, the FCC argued that "federal displacement of state regulation is justified under the Act when necessary 'to avoid frustration of validly adopted federal policies.' " 476 U.S. at 362, 363. In the face of this argument, the Court observed that "it goes without saying that we do not assess the wisdom of the asserted

---

[13] Although AT&T attempts to bloat the importance of the issues by arguing that Federal district courts reviewing State commission arbitration decisions "should stay proceedings pending this Court's decision," AT&T Pet. 11, California is unaware of AT&T, MCI or the FCC requesting that *any* district court do so. Moreover, all three of those parties have appeared in numerous such district court cases and have filed pleadings *relying* on the Eighth Circuit's decisions on various issues.

federal policy of encouraging competition within the telecommunications industry. Nor do we consider whether the FCC should have authority to enforce, as it sees fit, practices which it believes would best effectuate this purpose." *Id.* at 359. The Court then rejected the FCC's argument, stating: "As we so often admonish, only Congress can rewrite this statute." *Id.* at 376.

Similarly here, the petitioners seek to justify the FCC's usurpation of State authority over intrastate matters based on the assertion that a construction of the statute displacing the role of the States is necessary to avoid the frustration of competition. FCC Pet. 24, 29-30. The petitioners' assertion is both false and irrelevant. It is false because, as the FCC acknowledged in both of its orders below, the States pioneered the shift from regulation to local competition long before the 1996 Act was conceived. Moreover, the States have consistently met and continue to meet their responsibilities under the Act. Thus, if "[i]ncumbent monopolists benefit enormously from any delay in opening their markets to competition," FCC Pet. 30, it is the FCC's overreaching, not any action or inaction by the States, that has spawned that result. Finally, the petitioners' assertion is irrelevant because here, as in *Louisiana*, and as correctly found by the court of appeals, the FCC's remedy lies with Congress, not this Court.

CONCLUSION

While the 1996 Act may be "an unusually important legislative enactment," the questions presented by these cases are half as important and twice as easy as petitioners would have the Court believe. The Court has previously rejected the same hyperbolic arguments in

ruling on the same petitioners' applications to vacate the Eighth Circuit's stay of the FCC's orders. Moreover, the Eighth Circuit's decisions are correct, they are fully consistent with congressional intent, and they provide a workable blueprint for the transition from regulation to local telephone competition under the 1996 Act. There is no conflict between the decisions below and the decisions of this Court or other circuits. Additionally, there is no necessity for this Court to address the jurisdictional questions, which it has already addressed in *Louisiana* and in its order denying the applications to vacate the stay. Finally, as competition moves forward, after the delay engendered by the FCC's jurisdictionally defective reading of the Act, this Court and other courts will have opportunities to address the 1996 Act, if and when the need arises.

The petition for a writ of certiorari should be denied.

Respectfully submitted,

APPENDIX

Second Report and Order, FCC 96-333, 11 FCC Rcd 19392, 19414 ¶ 37 (1996) (footnotes omitted.)

c. Discussion

37. With respect to toll service, we conclude that section 251(b)(3) requires, at a minimum, that customers be entitled to choose presubscribed carriers for their intraLATA and interLATA toll calls. Because of the variations that exist among LATA boundaries and toll traffic within, and among, the various states, we have also concluded that each state should have the opportunity to determine whether customers should be able to presubscribe to carriers for intrastate toll service and for interstate toll service in lieu of the intraLATA and interLATA toll presubscription dichotomy that we have established as a minimum nationwide standard at this time. Although toll dialing parity typically has been based on LATA boundaries in multi-LATA states where it has been implemented, we do not impose a requirement that toll dialing parity be based only on LATA boundaries given our expectation that implementation of the 1996 Act eventually will diminish the significance of LATA boundaries. We are aware that BOCs remain subject to certain LATA boundary restrictions for at least the near-term and that some BOCs may find it technically infeasible, or otherwise undesirable, to implement toll dialing parity based on state boundaries. We thus conclude that states should be able to take the relevance of those factors into account, where applicable, and have the flexibility to require that toll dialing parity implementation be based on state boundaries where they determine that implementing toll dialing parity on the basis of state

boundaries would be pro-competitive and otherwise in the public interest. In Alaska and Hawaii, states with no LATAs, toll dialing parity will continue to be based on state boundaries.

ADMINISTRATIVE LAW JUDGE'S RULING DECIDING ISSUES RAISED AT JANUARY 28, 1997 PREHEARING CONFERENCE, GRANTING ONE-WEEK EXTENSION OF TIME FOR FILING OPENING COMMENTS, AND SETTING SCHEDULE FOR PROCEEDING

* * *

Should The Issue of "Arbitrage" Between Rates For Rebundled Network Elements And Rates For Wholesale Service Be Considered In the Pricing Hearings?

A second important question at the PHC [pre-hearing conference], which counsel for GTEC characterized

as "separate, although related" to the issue of "actual costs" (id. at 268), was whether hearing time should be allotted to the issue of rate "arbitrage." Pacific described the issue as follows on pages 2-3 of its January 22 PHC statement:

> "The FCC has ordered that CLCs be allowed to purchase and combine unbundled network elements together. In some instances, the combination of [unbundled network elements, or UNEs] can be used to create the same retail services which we offer for resale at a discount . . . In these situations, there is an opportunity for arbitrage if there is a difference between the price for the combined UNEs and the resale price for the retail service. This arbitrage has potentially large financial impacts, since key services vulnerable to this arbitrage include our basic exchange services, and our switched access services provided to interexchange carriers."

At the PHC, counsel for AT&T argued that since the potential for such arbitrage is inherent in the Telecommunications Act of 1996 (Act), the issue is "not legitimate" and a "red herring." Counsel for MCI explained how the potential for arbitrage arises from the different pricing standards for UNEs and wholesale service contained in the Act:

> "The Act clearly contemplates the kind of bottom-up TELRIC analysis, or some version of that, that the FCC and this Commission have pursued, [f]or what the FCC calls UNEs and what this Commission has called BNFs.

> "Conversely, the Act also clearly contemplates that the determination of an appropriate wholesale discount looks at the retail rate – the rate[,] not the cost – and then takes away from that avoided cost.
>
> "So if there is an [arbitrage] issue to be addressed . . . it may well be that that is what the Act itself contemplates." (1/28 PHC Tr. at 255.)

Counsel for GTEC responded with the observation that the Act's differing pricing standards cannot be considered the end of the debate:

> "Contrary to the comments of one of the parties, we're not seeking to change the pricing standards that have been set up under the Act. We recognize that there's two distinct standards.
>
> "However, I think that the Act as well as the FCC Order were silent when you came to the issue of how those two pricing standards interact.
>
> "And I agree with [counsel for Pacific] that if you have a situation where somebody can purchase the little [unbundled] pieces and combine them up at a lower price than the resale rate, essentially you're making [the wholesale] section of the statute meaningless; and I think that's not the way statutes are intended to be read." (**Id.** at 269.)

Upon reflection, I agree with Pacific and GTEC that the arbitrage issue is not necessarily inherent in the Act's two pricing standards, but arises out of the way in which

the FCC has interpreted § 251(c)(3) of the Act in its First Report and Order. This issue is hotly contested and is squarely before the Eighth Circuit in *Iowa Utilities Board*.[10] If the Eighth Circuit concludes that the FCC's interpretation of § 251(c)(3) is erroneous, then it seems likely that this Commission will have to deal with the arbitrage issue. If the Eighth Circuit concludes that the FCC's interpretation of § 251(c)(3) is correct, then barring an appeal to the Supreme Court, the arbitrage issue will presumably become moot. Either way, the prudent

---

[10] The issue is framed as follows at pages 64-65 of the Brief of the Regional Bell Companies and GTE (Large LEC Brief) in *Iowa Utilities Board*:

> "Under section 251(c)(4), Congress imposed a distinct duty on incumbent LECs to provide retail services to requesting carriers at wholesale rates so that those carriers can resell the services to subscribers. Congress defined a distinct pricing standard for resold services, *see* § 252(d)(3), and expressly restricted the uses that can be made of them, *see* § 271(e)(1). The Order would nullify these provisions by construing section 251(c)(3) to give requesting carriers an entirely different avenue for reselling the incumbent LEC's own finished service, solely through the imaginary process of 'unbundling' the LEC's entire network and 'reassembling' the pieces. . . . The FCC's 'rebundle' rule in effect adds to the two options enacted by Congress (unbundled elements and resale) a third option that does not appear in the statute (rebundled elements). These rebundled elements can be exactly the same, in every respect, as the LECs' resold services, but they must be priced at rates much lower than those derived from the wholesale discount for resold services. This is not only contrary to the terms of section 251(c)(3), but also flatly contradicts the specific pricing standards and other restrictions that Congress crafted for limiting the reselling of services under the Act."

For a full discussion of this issue, see the following portions of the briefs in *Iowa Utilities Board*: Large LEC Brief at 64-69, FCC Brief at 99-106, Brief of AT&T et al. at 72-77, Large LEC Reply Brief at 42-45.

course of action is to allot hearing time on a provisional basis to consider the arbitrage issue, and then await developments. Accordingly, the revised procedural schedule attached to this Ruling as Appendix A includes an extra week of hearing time to deal with the arbitrage question.

Re: Docket No. 96-09-09 – Application of MCI Telecommunications Corporation for Arbitration Pursuant to Section 252(b) of the Telecommunications Act of 1996

Dear Secretary Murphy:

MCI Telecommunications Corporation ("MCI") submits this letter in response to the November 14, 1997 letter of the Southern New England Telephone Company ("SNET") in the above-referenced docket. SNET, in its letter, seeks to reopen the arbitration between the parties in order to modify certain provisions contained in the Agreement for Network Interconnection and Resale between SNET and MCImetro ("Agreement"). In particular, SNET requests that the Department of Public Utility Control ("Department") reopen the proceeding to modify the Warranties section (April 23, 1997 Errata, Section 13) as well as the provision regarding combinations of unbundled network elements (Agreement, Issue 16). SNET claims that the October 14, 1997 Eighth Circuit Court decision invalidates these provisions of the Agreement and therefore under the Regulatory Approvals section as well as the Governmental Compliance section[1] they should be renegotiated. MCI emphatically disagrees with SNET's position with respect to these provisions and believes that the provisions should not be modified and should remain in full force and effect. MCI requests that the Department deny SNET's request to reopen the arbitration proceeding and instead enforce the relevant provisions of the Agreement.

On October 21, 1997, SNET sent a letter to MCI requesting an opportunity to "renegotiate" the sections of the Agreement relating to combinations of unbundled elements and warranties due to the recent decision of the Eighth Circuit. SNET requested that MCI respond to its request by October 31, 1997. SNET indicated that if it

---

[1] April 23, 1997 Errata at Section 2.2., Agreement, Governmental Compliance at p. 71.

did not receive a response from MCI by October 31, 1997, it would petition the Department to reopen the proceeding. MCI, by letter dated November 3, 1997, responded to SNET by stating that it was always available to discuss the parties relationship, but that the provisions of the Eighth Circuit decision cited by SNET do not require renegotiation of the Agreement.[2] On November 14, 1997, SNET filed its request with the Department to reopen the Agreement between the parties for the limited purpose described above.

SNET's request to renegotiate the Warranties section of the Agreement in light of the recent Eighth Circuit decision makes no sense. The Eighth Circuit decision has no bearing on the Warranties section contained in the Agreement and therefore should not be used as grounds to alter the provision. The Warranties section should stand as issued by the Department.

SNET provides no credible support for its request to renegotiate the provision of the Agreement pertaining to the combination of unbundled network elements.[3] SNET's legal argument in support of its request, that the

---

[2] SNET in its November 14, 1997 letter to the Department, grossly mischaracterizes MCI's position by stating that MCI refused to negotiate "based on its position that the Eighth Circuit Court's Opinion *does not allow* for the reopening of the Agreement." (Emphasis added.) A quick reading of MCI's November 3, 1997 response shows that MCI took no such position. Rather, MCI stated that the Eighth Circuit decision *does not require* the Agreement to be renegotiated. MCI did, however, indicate to SNET in its November 3, 1997 response that it was available to discuss the parties relationship. SNET did not contact MCI.

[3] Issue 16 – Combinations of Unbundled Elements – provides in pertinent part "SNET shall provide MCIm, at MCIm's request, additional combinations of the unbundled elements which SNET has agreed to make available pursuant to this Agreement."

Eighth Circuit decision has interpreted Section 251(c)(3) of the Telecommunications Act of 1996 ("Act") to prohibit the incumbent local exchange carrier ("ILEC") from combining network elements upon request is patently incorrect. The Eighth Circuit found and held that the FCC's regulation that required ILECs to perform the combinations was inconsistent with the Act. The Act *does not* prohibit ILECs from voluntarily agreeing to perform element combinations – as SNET did[4] – and it likewise *does not* prohibit the state commissions from requiring the ILEC to do so as a matter of state law and policy. The limited legal effect of the Eighth Circuit opinion is the invalidation of the FCC's regulations mandating that ILECs perform the combinations.

Other state commissions have recently ruled on this issue. In Ohio, the Public Utilities Commission noted that the Eighth Circuit's October 14 decision "did not address state action under Federal Law or state action under state law." Further, the Ohio Commission found that the "Eighth Circuit's Order on rehearing notwithstanding, Ameritech's agreement through the give and take of an arm's length negotiation process, ***establishes an independent basis*** upon which to enforce the terms of the interconnection agreements. . . . " (emphasis added). Similarly, the Texas Public Utilities Commission has

---

[4] On December 23, 1996, SNET submitted Revised Best and Final Offer language to the Arbitrator regarding the combination of unbundled elements (Issue 16). SNET's language did not object to the combination of unbundled elements instead, SNET agreed to provide such combinations of unbundled network elements and agreed to work with MCI to define the agreed upon time frame in which a combination would be made available and the priority in which a combination would be made available. SNET's December 23, 1996 Revised Best and Final Offers at p. 16. A majority of SNET's Best and Final Offer language is contained in the Agreement.

recently found that Southwestern Bell may not now refuse to provide combinations of elements even after the Eighth Circuit's order because Southwestern Bell had voluntarily agreed to provide such combinations in its interconnection agreement.[5]

In addition, the portions of the Agreement that SNET bases its request for renegotiation on, in particular; the Regulatory Approvals section and the Governmental Compliance section[6], do not support or justify its request. These provisions of the Agreement condone renegotiation when a provision is rendered unlawful or is invalidated by a subsequent court order or other legislative, regulatory or legal action. As noted above, the Eighth Circuit's invalidation of the FCC's regulation does not make the provision of the Agreement pertaining to combinations of unbundled elements unlawful nor does it invalidate that provision.

---

[5] Similarly, in an earlier decision, not on the issue of combinations of elements, the New York Public Service Commission concluded that it would not interfere with those provisions arrived at through negotiations by the parties and that there is no legal requirement that the Commission amend those portions of an agreement. October 1, 1997 Order Approving Interconnection Agreement, Rejecting Portions Thereof, and Granting Reconsideration at pp. 5-6.

[6] Regulatory Approvals, Section 2.2 states in pertinent part "In the event . . . a court with appropriate jurisdiction issues orders, which make *unlawful* any provision of the Agreement, the parties shall negotiate promptly and in good faith . . . " (Emphasis added.) Governmental Compliance states in pertinent part "[I]n the event that legislative, regulatory, other legal action or changes in laws *invalidate* a material term(s) of this Agreement . . . the Parties shall attempt to renegotiate a new term(s) as may be required to allow this Agreement to continue." (Emphasis added.)

In conclusion, MCI requests that the Department deny SNET's request to reopen the arbitration in light of the recent Eighth Circuit Court decision for the purpose of renegotiating the Warranties provision and the provision regarding combinations of unbundled network elements. These provisions should not be modified and should remain in full force and effect.

Sincerely,

/s/ Kimberly A. Wild

QUESTIONS PRESENTED

1. Did the Court of Appeals err in concluding that the plain terms of the provisions of the Telecommunications Act of 1996 ("Act") governing competition in local telephone markets leave pricing and other determinations exclusively to the state public utility commissions, which have historically made those determinations, and not to the Federal Communications Commission ("FCC")?

2. Did the Court of Appeals err in vacating an FCC rule that, as petitioners themselves acknowledge, would allow new entrants to obtain from incumbent local telephone carriers an already combined platform of network elements at cost-based prices, when the Act allows entrants to obtain only *unbundled* network elements at cost-based prices?

3. Did the Court of Appeals err in vacating the FCC's rule implementing 47 U.S.C. § 252(i) as improperly subverting the system of private negotiation established by Congress?

LIST OF PARTIES AND AFFILIATES

Aliant Communications Company is a wholly owned subsidiary of Aliant Communications Inc., a publicly traded company. It has no non-wholly owned subsidiaries.

ALLTEL Telephone Services Corporation is a wholly owned subsidiary of ALLTEL Corporation, a publicly traded company. It has no non-wholly owned subsidiaries, but does have investment interests in the following publicly traded companies: Applied Global Internet, Champaign Telephone, Conestoga Telephone, Conneaut Telephone, Horizon Telecom, Inc., SPRINT and WorldCom, Inc.

Cincinnati Bell Telephone Company is a wholly owned subsidiary of Cincinnati Bell Inc., a publicly traded company. It has no non-wholly owned subsidiaries.

The Concord Telephone Company is a wholly owned subsidiary of CT Communications, Inc., a publicly traded company. It has no non-wholly owned subsidiaries.

North State Telephone Company is a wholly owned subsidiary of North State Telecommunications Corporation, which is not a publicly traded company. It has no non-wholly owned subsidiaries.

Pacific Telecom, Inc. is a wholly owned subsidiary of Century Telephone Enterprises, Inc., a publicly traded company. Pacific Telecom, Inc. has the following non-wholly owned subsidiaries: Gem State Utilities Corporation; Northwestern Telecom Systems, Inc.; Pacific Telecom Cable, Inc.; and STU Partnership.

Rock Hill Telephone Company has no parents or non-wholly owned subsidiaries.

Roseville Telephone Company is a wholly owned subsidiary of Roseville Communications Company. With regard to non-wholly owned subsidiaries, Roseville Telephone Company holds a minority equity interest in the Sacramento Valley Limited Partnership and a majority equity interest in West Coast PCS LLC.

The Southern New England Telephone Company ("SNET") is a wholly owned subsidiary of Southern New England Telecommunications Corporation, a publicly traded company. SNET has no other parents, non-wholly owned subsidiaries or affiliates that issue stock or debt securities to the public.

The Independent Telephone & Telecommunications Alliance ("ITTA") is a non-profit trade association representing 15 mid-sized independent telephone companies providing local exchange and exchange access telephone service in 41 states. ITTA has no parent companies or subsidiaries.

ON PETITIONS FOR A WRIT OF CERTIORARI
TO THE UNITED STATES COURT OF APPEALS
FOR THE EIGHTH CIRCUIT

BRIEF FOR THE MID-SIZED LOCAL EXCHANGE CARRIERS IN OPPOSITION TO PETITIONS FOR A WRIT OF CERTIORARI

This brief in opposition to the petitions for a writ of certiorari is filed on behalf of nine telecommunications companies that are based in virtually every part of the country and a trade association. Each of the respondent companies is an incumbent local exchange carrier ("LEC"), as that term is defined in

47 U.S.C. §§ 153(26) and 251(h)(1), as added by the Telecommunications Act of 1996 ("Act"), Pub. L. No. 104-104, 110 Stat. 56 (1996).[1] The nine companies actively participated as petitioners and intervenors in the briefing and argument before the United States Court of Appeals for the Eighth Circuit and were collectively referred to as the "Mid-Sized LECs."[2] In contrast to the "large LECs," *i.e.*, the Bell Operating Companies ("BOCs") and GTE Service Corporation ("GTE"), each of the Mid-Sized LECs individually controls fewer than two percent of the nation's telephone access lines. The Independent Telephone & Telecommunications Alliance is a non-profit trade association representing 15 mid-sized LECs providing local exchange and exchange access telephone service in 41 states. Respondents have endeavored in this brief not to repeat the arguments set forth in the briefs in opposition filed by GTE and the BOCs; the Mid-Sized LECs fully support their arguments and incorporate them by reference in this brief.

STATEMENT

The petitions are built upon three themes, each of which is essential to petitioners' arguments on the merits, as well as to their asserted reasons for granting a writ of certiorari: (1) the states have been at best slow and at worst obstructionist in the

---

[1] The Act amended the Communications Act of 1934, 47 U.S.C. § 151 *et seq.*; relevant excerpts from the Act are reproduced in the Appendix to the petition in *AT&T Corp., et al. v. Iowa Utilities Bd., et al.*, No. 97-826 ("Pet. App."). Sections 2 and 3 of the Communications Act of 1934 are codified at 47 U.S.C. §§ 152 and 153.

[2] The "Mid-Sized LECs," and their principal places of business, are as follows: Aliant Communications Co. (Lincoln, Nebraska); ALLTEL Telephone Services Corp. (Little Rock, Arkansas); Cincinnati Bell Telephone Co. (Cincinnati, Ohio); The Concord Telephone Co. (Concord, North Carolina); North State Telephone Co. (High Point, North Carolina); Pacific Telecom, Inc. (Vancouver, Washington); Rock Hill Telephone Co. (Rock Hill, South Carolina); Roseville Telephone Co. (Roseville, California); and The Southern New England Telephone Co. ("SNET") (New Haven, Connecticut).

move toward competition in local telephone markets, and state commissions are either unable or unwilling to regulate interconnection among competing local carriers in accordance with the Act; (2) all telephone carriers are virtually identical national or international giants, and all local telephone markets are uniform; therefore, "one-size-fits-all" national rules on pricing and other aspects of local competition, all determined by the Federal Communications Commission ("FCC"), are necessary to achieve Congress's goals in enacting the Act; and (3) the Eighth Circuit's decision has derailed the competition that the Act seeks to foster. None of these assertions is true. These themes that so permeate petitioners' arguments reflect the "Washington-knows-best" attitude that the 104th Congress explicitly rejected in crafting the Act.

1. Local telephone service has traditionally been provided by a single company operating in a defined territory. At present, there are over 1,000 LECs of a wide variety of sizes that provide local exchange service in the numerous local markets throughout the Nation.[3] See H.R. Rep. No. 104-204, at 49-50, *reprinted in* 1996 U.S.C.C.A.N. 10, 12-13 (1995) (the "*House Report*"). Those local markets differ dramatically in geography, demographics, infrastructures, and population densities, all of which affect the structure, cost and pricing of local service. Historically, state utility commissions have strictly regulated the price and service offerings of intrastate telephone service and imposed "universal service" obligations on the LECs serving those markets, requiring those carriers to serve their entire service areas, the densely populated as well as the remote, and all of their citizens, business and residential customers alike. By law, the FCC has no jurisdiction over local telecommunications markets; its jurisdiction is limited to

---

[3] For example, the Mid-Sized LECs range in size from approximately 90,000 to 2 million access lines as of December 1, 1995, while by comparison, the BOCs and GTE range from approximately 14 to 21 million access lines. United States Telephone Ass'n, *Phone Facts* (1996) (App. A-213) (all citations to "App. A-_" are to the Appendix of the Mid-Sized LECs filed in the Eighth Circuit on Nov. 18, 1996).

interstate matters only. *See Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355, 372-73 (1986); 47 U.S.C. § 152(b).

Because virtually every state is served by more than one LEC, state commissions also have for decades regulated interconnection in local telephone markets. For example, 150 LECs serve Iowa alone. App. A-212. Without interconnection, a family served by one LEC in a particular town in Iowa would be unable to place a local telephone call to another family served by a different LEC in a neighboring town. Most state commissions have thus developed considerable familiarity with the technical and economic issues that arise when more than one telephone company provides service – albeit, non-overlapping service – in the same state.

Competition began developing in the 1970s in the markets for telephone equipment, information services and long-distance services. S. Rep. No. 104-23, at 2 (1995) (the "*Senate Report*"). In view of the increasing success of competition in the long-distance market, and with cable companies in particular recognizing that they were well positioned to offer local telephone service, many states began to investigate the prospects of bringing competition to the local exchange market before Congress enacted the Act. Beginning in earnest in 1993 and 1994, numerous state legislatures and regulatory commissions introduced competition in their local telephone markets, thereby setting the stage for the widespread competition in the local market that Congress sought to extend to all states in the Act. For example, as early as 1994 the Connecticut legislature had acted to open all telecommunications markets in Connecticut to competition. *See* Conn. Gen. Stat. § 16-247a *et seq*. Further, that state's principal local exchange carrier had already signed a comprehensive agreement with governmental agencies and with numerous competitors (including petitioners AT&T, MCI and MFS) governing many aspects of interconnection, network unbundling and physical collocation, leading the state utility commission to comment in approving the agreement that it constituted "irrefutable evidence of the ability to achieve reasonable agreement on issues of common concern to the

industry and the public." *In Re The Southern New England Telephone Company*, Docket No. 94-10-02, 1995 WL 807764 (Conn.D.P.U.C. Sept. 22, 1995).[4] Thus, as the FCC itself recognized in its notice of proposed rulemaking in this matter, as of 1996, 19 states had already taken action to open local exchange markets to competition, including seven states in which competing firms had already begun to offer switched local service. *See In Re Implementation of the Local Competition Provisions of the Telecommunications Act of 1996*, Notice of Proposed Rulemaking, 61 Fed. Reg. 18311, 18314 (1996) (App. A-81,84).

2. With knowledge of this progress toward deregulation of the local exchange market, Congress in February 1996 passed the Act to ensure that the citizens of all states shared in the benefits of competition in all sectors of the telecommunications industry.[5] The local competition provi-

[4] App. A-140-41; A-169-86. *See also Order adopting a telecommunications price regulation and local competition plan*, 164 P.U.R. 4th 324, 1995 WL 627739 (Ala.P.S.C. Sept. 20, 1995); *Interim Order*, 167 P.U.R. 4th 349, 1995 WL 767890 (Cal.P.U.C. Dec. 20, 1995) (order of California Commission certifying 31 carriers to offer facilities-based local exchange services); *Order re: Competition for Local Exchange Service*, 163 P.U.R. 4th 155, 1995 WL 467996 (Cal.P.U.C. July 24, 1995); *Interim Opinion*, 1996 WL 223624 (Cal.P.U.C. April 10, 1996) (California Commission holding that state regulations concerning number portability are consistent with the Act); *In Re The Southern New England Telephone Company's Cost of Providing Service*, Docket No. 94-10-01, 1995 WL 509180 (Conn.D.P.U.C. June 15, 1995) (order of Connecticut commission certifying 15 companies to provide local exchange service); *In Re The Southern New England Telephone Company*, Docket No. 94-10-02, 1995 WL 807764 (Conn.D.P.U.C. Sept. 22, 1995) (approving comprehensive accord on interconnection, network unbundling and other aspects of local competition); *Order Setting Out Regulatory Structure for Competing Local Providers and Promulgating Rules*, Dkt. P-100, Sub 133, 1996 WL 593672 (N.C.U.C. Sept. 18, 1996) (North Carolina Utility Commission docket implementing North Carolina legislation on local competition.)

[5] Congress quite clearly recognized that "[s]everal States (such as New York, California, and Illinois) have taken steps to open the local networks of telephone companies." *Senate Report* at 5.

sions of the Act that are the focus of the petitions – 47 U.S.C. §§ 251-261 – are among many portions of the Act that were broadly intended to "open all telecommunications markets to competition." Joint Explanatory Statement of the Committee of Conference, H.R. Rep. No. 104-438, S. Rep. No. 104-230, at 1 (1996), *reprinted in part in* 1996 U.S.C.C.A.N. 124 (the "*Conference Report*"); *see House Report* at 202.

While one would never know it from the petitions, Congress's avowed goal in enacting the Act was to promote competition in local telecommunications markets through "a pro-competitive, *de-regulatory* national policy framework." *Conference Report* at 1, 113 (emphasis added). Congress thus sought to "reduc[e] regulation of the telecommunications industry . . . [in order to] spur the development of new technologies and increase investment in these industries." *Senate Report* at 9; *see id.* at 10 ("By reducing regulation and barriers to competition, the bill will help ensure the future growth of these industries"). The Act, therefore, reflects Congress's "belief that more competition, rather than more regulation, will benefit all consumers," a belief that petitioners clearly do not share. *House Report* at 50.

Consistent with its deregulatory approach, Congress provided new entrants with access to the incumbent carrier's existing network and then relied principally upon private freely negotiated agreements between new entrants and incumbents to determine the precise extent and terms of that access. 47 U.S.C. §§ 251(c)(1), 252(a)(1).[6] In recognition of the fact that the local exchange market is, in the words of the FCC to this Court, the "*paradigmatic intrastate market*,"[7] and in keeping

---

[6] This emphasis on private negotiation is also evident in the regulatory portions of the Act, which provide that if after *several months* of negotiation the parties are at an impasse on some or all issues, a party *may* petition a state commission to arbitrate open issues in their agreement. 47 U.S.C. § 252(b).

[7] Application to Vacate Stay, *FCC v. Iowa Utilities Bd.*, No. A-299, at 22 (Oct. 24, 1996) (emphasis added); *see* Pet. App. 15a n.16, 22a.

with the states' historical jurisdiction over, and experience with, that local market, Congress made the state utility commissions the principal governmental actors in carrying out the federal mandates. Thus, while other parts of the Act dealing with interstate telecommunications assign a paramount regulatory role to the FCC (*see, e.g.*, § 271(d)), the local competition provisions of the Act respect the traditional preeminent role of the states in regulating local telephone service and, in particular, their expertise in local rate and pricing issues.[8] *See* Pet. App. 10a-16a.

The Act prescribes broad standards that Congress intended state commissions would apply to the specific local facts and circumstances presented by the arbitrating parties. In a clear rejection of the FCC's plea for a centralized bureaucratic structure that would "more efficiently" implement the Act, Congress explicitly: allowed parties to negotiate and enter into interconnection agreements "without regard to the standards" set forth in the Act (§ 252(a)(1)); gave *state commissions* the exclusive authority to approve or reject those agreements and to "[d]etermin[e]" and "establish any rates for interconnection, services or network elements" (§ 252(c), (d)(1), (e)); allowed *state commissions* to suspend or modify provisions of the Act for mid-sized and small LECs (§ 251(f)(2)); and expressly barred the FCC from preempting state commission rules and policies on interconnection and access unless those rules "*substantially* prevent implementation of the Act" (§ 251(d)(3) (emphasis added)). Thus, Congress enacted specific provisions that expressly contemplated different, state-by-state and even company-by-company approaches to implementing the congressional mandate for competition in local telephone markets, recognizing, as petitioners refuse to do, that each local market and each of the

---

[8] The legislative history confirms what the language and structure of sections 251 and 252 show—that Congress made a conscious choice to reserve exclusive control over pricing issues to state commissions. *See* S.652, 104th Cong., 1st Sess. §101(c) (1995); H.R. 1555, 104th Cong., 1st Sess. § 101(e)(1) (1995).

over 1,000 local carriers are not identical – that solutions that might work in New York City or Washington, D.C. might be disastrous in Des Moines or Fargo and that requirements that might merely annoy a large national LEC might threaten the very existence of a mid-sized or smaller LEC.

The extent of the FCC's role under this statutory scheme is clear: only "if a State Commission fails to act to carry out its responsibility under this section [252] in any proceeding or other matter under this section," may the FCC "issue an order preempting the State commission's jurisdiction of that proceeding or matter." 47 U.S.C. § 252(e)(5). In that circumstance alone may the FCC "act for the State commission." *Id.* The structure and express terms of the Act, therefore, reflect Congress's intent not to override the efforts of state commissions that were working to open their local markets to competition.

Yet, in its nearly 700-page, single-spaced First Report & Order,[9] the FCC did not see fit to live by these clear rules of the road established by Congress. Instead, the FCC consistently bridled at Congress's deregulatory, negotiation-focused framework and sought to impose its own national, "one-size-fits-all" rules over every aspect of every local telephone market in the Nation. As the Eighth Circuit recognized, the FCC sought "to preempt any state pricing regulation that would employ a different methodology" from the FCC's. Pet. App. 21a n.19. Moreover, under the FCC's "command and control" approach, state commissions would no longer implement their own regulatory policies on interconnection and access in the intrastate telephone market, even when those policies are consistent with the terms of the Act and would "not substantially prevent" achievement of the competition that Congress sought to encourage in the Act. Indeed, in a preemptive act of

---

[9] *In Re Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, First Report and Order, 61 Fed. Reg. 45476 (1996) (to be codified at 47 C.F.R. pt. 51) ("First Report & Order"). Excerpts from the First Report & Order are reprinted at Pet. App. 131a-337a.

unprecedented scope, the FCC issued a blanket order prohibiting state commissions from issuing *any* requirements or applying *any* policy that differed in any way from the FCC's own rules – in a stroke of a pen relegating state commissions to the hapless task of merely administering the FCC's rules.

3. Perhaps the most regrettable aspect of petitioners' statement of the case is their claim that the Eighth Circuit's decisions, including its earlier stay of the pricing rules, are somehow responsible for delays in the achievement of full competition in the local markets. *See, e.g.*, AT&T Pet. 12. Nothing could be further from the truth. Indeed, to the extent that there has been any undue delay in accomplishing what Congress recognized would be the difficult, complex and time-consuming task of opening all telecommunications markets to full competition,[10] such delay is attributable, in large measure, to the FCC's own misguided attempts to displa the pro-competition efforts of various states and to the well publicized preoccupation of petitioners such as AT&T, MCI and WorldCom with mergers and acquisitions among themselves, as well as their singular focus on trying to pick off only lucrative business customers of the local telephone carriers instead of investing in the facilities or services necessary to provide quality local service to *all* local customers—residential and commercial alike.[11]

Thus, in the months after Congress passed the Act many state commissions had already moved to adopt rules and

---

[11] *See, e.g.*, J. Keller, *AT&T's New Chief Plans Bold Agenda*, Wall Street J., Dec. 3, 1997, at A3 (reporting that AT&T's new CEO is laying groundwork for possible mega-merger); M. Mills, *WorldCom Would Shift MCI's Focus*, Washington Post, Oct. 3, 1997, at A1 (quoting WorldCom's Vice Chairman; "Our strategy is not in the consumer business"); *WorldCom Makes Unsolicited $29 Billion Stock Bid For MCI*, Communication Daily, Oct. 2, 1997 (reporting on WorldCom's $29 billion bid for MCI).

policies designed to foster interconnection and access in the manner envisioned by Congress, and many parties were in the process of negotiating agreements to provide interconnection and access. *See supra* at note 4 and accompanying text. However, as the Eighth Circuit found, the adoption of the FCC's rules, and its attempt at blanket preemption of any state rules on pricing and other aspects of interconnection, had the "direct effect" of stopping pending negotiations, arbitrations and state dockets in their tracks, until the Eighth Circuit issued its stay of the pricing provisions which permitted negotiations and arbitrations to proceed. Pet. App. 10a n.9; *see Iowa Utilities Bd. v. FCC*, 109 F.3d 418 (8th Cir. 1996).

Proceed they did. Once again, while the Court will not find any mention of this in the petitions, the fact is that nearly 200 interconnection agreements had been signed by February 1997, within four months of the Eighth Circuit's stay opinion. By November 1997, just 20 months after passage of the Act, over 280 companies had signed over 1,700 interconnection agreements to provide local service of some kind in over 450 cities through the country![12] Not only have companies negotiated and signed interconnection agreements, but they have also begun to offer local telephone service under the watchful oversight of state commissions, precisely in the manner envisioned by Congress.

For example, in Connecticut – one of the first states targeted by petitioners such as AT&T, MCI and others, for local competition[13] – the state utility commission has certified over

Keveney, *TCI Service to*

(Footnote continued)

36 companies to provide local exchange service and over 200 companies to offer intra-state toll services, and it has ruled that beginning in January 1999 every residential and small business customer of respondent SNET, the incumbent local carrier, will be required to select by ballot which of the many certified carriers they wish to use for local telephone service. *In Re Investigation of The Southern New England Telephone Company*, Docket No. 94-10-05 (Conn.D.P.U.C. June 25, 1997), *as revised by*, Draft Decision (Conn.D.P.U.C. Dec. 1, 1997) (not available on West Law). Nine of the 36 certified local exchange carriers are currently offering local telephone service in Connecticut, including petitioners AT&T and MCI. Similar competition is occurring in other states' markets.[14]

REASONS FOR DENYING THE PETITIONS

Petitioners essentially advance only two reasons for granting a writ of certiorari in these cases: first, the Eighth Circuit's decision is wrong on the issues presented; and second, the Eighth Circuit's decision has permitted state utility commissions and LECs (presumably in some grand conspiracy with one another) to obstruct the movement toward local competition. As shown below and in the briefs in opposition filed by GTE and the BOCs, neither argument has merit.

The Eighth Circuit carefully considered the concerns and extensive arguments from literally hundreds of petitioners,

---

Expand Next Month, Hartford Courant, Dec. 20, 1995, at A3 (reporting that TCI chose Hartford for one of its first forays into local telephone competition).

[14] For example, respondent Cincinnati Bell Telephone Co. has voluntarily negotiated and entered into, and has arbitrated, numerous interconnection agreements in Ohio, Kentucky and Indiana. Time Warner is already providing facilities–based service in Cincinnati; MCI is expected to be operational there in January; and other companies are already reselling services in that market or are authorized to do so. The Nebraska Public Service Commission has certified 13 companies as Local Competition carriers and approved 19 interconnection agreements. *See USTA Competition Report.*

respondents and intervenors on dozens of issues; it heard more than six hours of legal argument from the parties at hearings on the stay and on the merits; and, after seven months of deliberation, the court issued a detailed, thoughtful and balanced opinion that vacated some FCC rules but affirmed many others. In vacating the FCC rules, the court adhered strictly to the language and structure of the Act, as buttressed by its legislative history; by contrast to the FCC, the court did not substitute its own policy views for those enacted by Congress. As a result, the "pro-competitive, deregulatory national policy" that Congress intended when it passed the Act has been restored, and the movement toward achieving competition in local telephone service in the manner envisioned by Congress is proceeding apace. There is, therefore, no reason to grant a writ of certiorari.

I.

THE EIGHTH CIRCUIT'S DECISION IS CONSISTENT WITH THE LANGUAGE AND STRUCTURE OF THE ACT AND THIS COURT'S PRECEDENTS

The Eighth Circuit's decision faithfully adhered to the terms of the Act, proper principles of statutory construction and deference to administrative agencies, and this Court's precedents governing the scope of the FCC's jurisdiction over intrastate telecommunications. Contrary to petitioners' claims, the Eighth Circuit did not purport to, nor did it, announce any new legal principles or call into question the principles that this Court has applied when construing federal legislation, including the Communications Act.

The FCC and other petitioners devote much of their petitions to arguing that the Eighth Circuit supposedly erred in rejecting the FCC's assertion of jurisdiction to regulate pricing in the local telephone markets. The briefs in opposition filed by GTE and the BOCs provide this Court with the principles of statutory analysis supporting the Eighth Circuit's decision on pricing jurisdiction. The Mid-Sized LECs fully endorse and incorporate herein those briefs in opposition.

A. This brief therefore focuses on parts of the Act *other* than those specifically governing whether the FCC has jurisdiction to regulate pricing. The FCC, in the First Report & Order, wrote out of the Act three provisions expressly preserving the paramount role of state commissions over local telephone service, including non-pricing issues. *See* 47 U.S.C. §§ 251(d)(3); 251(f); 252(e)(6). The Eighth Circuit decided that the FCC overstepped its bounds in construing those parts of the Act. Although petitioners include that decision within the questions presented,[15] no petitioner squarely discusses the decision below on those statutory provisions. Petitioners only obliquely suggest that the FCC's supposed jurisdiction over these non-pricing issues provides added support to their pricing jurisdiction arguments.[16]

As shown below, the Eighth Circuit's decision regarding §§ 251(d)(3), 251(f) and 252(e)(6) was legally correct and based on sound principles of statutory interpretation. Thus, contrary to petitioners' suggestion, the Act's clear limitations on FCC authority over these non-pricing issues undermines, rather than supports, the FCC's grab for jurisdiction over pricing in local telephone markets.

---

[15] All petitioners include in their questions presented both pricing and non-pricing issues. For example, in its first question presented, the FCC requests review of its statutory authority to issue rules on "the core provisions" of the local competition provisions of the Act, "including, *inter alia*, the provisions governing dialing parity and the standards for the prices" that incumbent LECs may charge. FCC Pet. I; *See* AT&T Pet. (i).

[16] Despite the FCC's reliance on the phrase "*inter alia*" in its first question presented, its reasons for granting the petition are limited to the statutory provisions in the Act governing pricing and the restrictions placed on the FCC's jurisdiction over intrastate telecommunications in § 2(b) of the Communications Act, 47 U.S.C. § 152(b). FCC Pet. 11-22. The FCC and other petitioners include only the briefest mention of the Eighth Circuit's decision on aspects of the Act other than those governing pricing jurisdiction. *See* FCC Pet. 9, 11 (citation to decision on § 251(f)), 14 n.5 (brief mention of decision on §§ 208 and 251(d)(3)). *See also* MCI Pet. 23 (brief mention of §§ 208 and 251(f)).

1. Preemption. 47 U.S.C. § 251(d)(3) is an "anti-preemption" clause entitled "Preservation of State access regulations." That provision prohibits the FCC, when either prescribing or enforcing rules to implement § 251, from preempting a state commission's regulations, orders or policies governing interconnection and access obligations in the local telephone markets unless those regulations, orders or policies are inconsistent with the requirements of § 251 or "substantially prevent implementation" of those requirements and the purposes of the local competition provisions of the Act. Nothing in § 251(d)(3) requires a state commission to conform its policies to the letter of the FCC's rules for those subject matters where the FCC *does* have jurisdiction to issue rules under § 251. The text of the statute quite clearly demonstrates Congress's intent that there is more than one way to implement the statutory requirements of § 251 without "substantially prevent[ing] implementation" of those requirements.

Nevertheless, the FCC unlawfully issued a blanket preemption order of *all* state commission regulations, orders and policies to the extent they do not implement § 251 in the precise manner as the FCC's detailed rules. *See* First Report & Order ¶¶ 101-03, 177-79 (Pet. App. 201a-202a; AT&T Lodging Materials).[17] As the FCC's then-Chairman publicly stated, the FCC's rules sought to consign state regulation of local exchange markets to the "trash can of history." Interview with Reed Hundt, *in* Telecommunications Report, Supp. at 10 (July 9, 1996). The FCC accomplished this unprecedented task with little analysis of the text of § 251(d)(3), and without developing *any* record in the rulemaking proceeding concerning whether a particular state commission's interconnection or access policy conflicted with the terms or purposes

---

[17] For example, the FCC ruled that "state requirements must be consistent with the FCC's implementing regulations," and that new entrants need not "comply with a multiplicity of state variations" in interconnection requirements. First Report & Order ¶¶ 103, 177 (Pet. App. 202a; AT&T Lodging Materials).

of the Act, as § 251(d)(3) requires before that policy may be preempted.[18] In one fell swoop, therefore, the FCC sought to wipe from the books the sound, lawful policies of even those state commissions that are widely acknowledged to be in the forefront of opening up local telephone markets to competition, despite Congress's expressed desire in § 251(d)(3) to "Preserv[e] . . . State access regulations."

The Eighth Circuit overturned the FCC's blanket preemption order, holding as follows:

> Even when the FCC issues rules pursuant to its valid rulemaking authority under section 251, subsection 251(d)(3) prevents the FCC from *preempting* a state commission order that establishes access and interconnection obligations so long as the state commission order (i) is consistent with the requirements of section 251 and (ii) does not substantially prevent the implementation of the requirements of section 251 and the purposes of Part II, which consists of sections 251 through 261. This provision does not require all state commission orders to be consistent with all of the FCC's regulations promulgated under section 251. . . . It is entirely possible for a state interconnection or access regulation, order, or policy to vary from a specific FCC regulation and yet be consistent with the overarching terms of section 251 and not substantially prevent the implementation of section 251 or Part II. In this

---

[18] Without a record concerning specific state regulatory policies, the FCC could have preempted state commissions in the present rulemaking under § 251(d)(3) only if it had found that there is *no possible* set of circumstances under which a state commission's actions that varied from the FCC's rules would satisfy the requirements of § 251(d)(3). *See California Coastal Comm'n v. Granite Rock Co.*, 480 U.S. 572, 580, 588-89 (1987). The FCC made no such finding, nor could it on this record. The Eighth Circuit's decision left the FCC free in appropriate circumstances and on an appropriate record to exercise its preemptive power in accordance with Congress's statutory restrictions. Pet. App. 40a & n.28.

> circumstance, subsection 251(d)(3) would prevent the FCC from preempting such a state rule, even though it differed from an FCC regulation.

Pet. App. 37a-38a (emphasis in original). This holding is nothing more than a straightforward application of the statutory language of § 251(d)(3), which expressly limits the preemptive scope of those FCC rules governing § 251 that are properly within its jurisdiction.

If Congress had intended in § 251(d)(3) that state commissions conforming their policies to the requirements "of this section" could do so only by strict adherence to the FCC's rules, then it would have said so. By contrast to other provisions in the same part of the Act, *see* 47 U.S.C. §§ 251(c)(4)(B), 252(c)(1), 252(e)(6), 261(c), which expressly require state commissions to adhere to FCC rules, the omission of any reference to FCC rules in § 251(d)(3) is consistent with Congress's treatment of state commission regulations elsewhere in that part of the Act. *See id.* §§ 252(d), 261(b). The FCC cannot minimize the import of Congress's omission of any reference to FCC rules in the anti-preemption provision of § 251(d)(3). *See Russello v. United States*, 464 U.S. 16, 23 (1983).[19] The FCC's reading of the statute is also

---

[19] The FCC's reading of § 251(d)(3) is plainly an effort to reverse a legislative defeat. While the Senate bill had no counterpart to § 251(d)(3), the House amended H.R. 1555 on the day it passed that bill to add § 242(b)(4)(B), the precursor to § 251(d)(3). The House version was identical in every respect to the final text of § 251(d)(3), except that it required that state commission regulations, orders and policies "not substantially prevent *the [FCC] from fulfilling* the requirements of this section and the purposes of this part." 141 Cong. Rec. H8444, cols. 2-3 (daily ed. Aug. 4, 1995) (inserting new subparagraph (B) in House Commerce Committee version of § 242(b)(4), reprinted in 141 Cong. Rec. H8427, col. 1) (emphasis added). The Conference, however, changed the House's phrase – "not substantially prevent the [FCC] from fulfilling the requirements of this section and the purposes of this part" – to the phrase as now found in § 251(d)(3) – "not substantially prevent implementation of the requirements of this section and the purposes of this part." The Conference also changed the caption from "accommodation" of state access

(Footnote continued)

illogical, because if state commissions could not adopt rules or policies different from the FCC's rules, no purpose would be served by the clause in § 251(d)(3) permitting preemption only if a state commission policy that otherwise is consistent with "this section" "substantially prevent[s] implementation of the requirements of this section and the purposes of this part."[20]

In sum, the FCC's argument that only uniform, national interconnection and access rules can advance the goals of the Act rests not on the language and structure of the Act, but on the FCC's own policy view of how best to implement competition. However, whether a single set of national rules might, as a policy matter, be preferable to state-by-state rules consistent with the Act is an issue that Congress has already decided in the anti-preemption provision of § 251(d)(3).

2. Review of State Commission Decisions. 47 U.S.C. § 252(e)(6) provides for federal district court review of a state commission decision to accept or reject a negotiated or arbitrated interconnection agreement between an incumbent LEC and its competitors.[21] Congress could not have made its intent

---

regulations to the more strongly-worded caption in § 251(d)(3), "preservation" of state access regulations.

[20] The FCC's blanket preemption order effectively grants the FCC exclusive jurisdiction to establish regulatory policies under § 251. Yet, it was only in § 251(e)(1) that Congress granted the FCC "exclusive" jurisdiction over certain aspects of numbering administration. That statutory reference to "exclusive" FCC jurisdiction – the only such reference in §§ 251 and 252 – would be superfluous unless Congress intended to preserve the right of state commissions to prescribe and enforce their own regulations implementing the remaining local competition provisions of the Act. *See* § 601 of the Act (uncodified) ("This Act . . . shall not be construed to modify, impair, or supersede Federal, State, or local law unless expressly so provided . . ."). *See Conference Report* at 91.

[21] In § 252, Congress placed each state commission – not the FCC – at the center of responsibility for overseeing the efforts of private parties to enter into agreements for interconnection, purchase of network elements, and reselling of services. If parties cannot initially come to terms through voluntary negotiation, then the state commission has sole authority to

(Footnote continued)

clearer. Thus, § 252(e)(6) – entitled "Review of State commission actions," states:

> In any case in which a State commission makes a determination under this section, any party aggrieved by such determination may bring an action in an appropriate Federal district court to determine whether the agreement or statement meets the requirements of section 251 of this title and this section.

Congress provided only one venue, "an appropriate Federal district court," for the parties aggrieved by state commission determinations.

Despite this straightforward provision governing judicial review, the FCC ruled that the FCC itself has authority to review a state commission decision to ensure its consistency with the Act and the FCC's rules. *See* First Report & Order ¶¶ 121-29 (Pet. App. 215a-220a). The FCC did so under the guise of its authority under 47 U.S.C. § 208 to hear complaints filed against a common carrier, even though § 208 nowhere authorizes the FCC to overturn decisions of a state commission. By this action, the FCC again revealed a mistrust of state regulators not shared by Congress, by seeking the review authority over state commission decisions that Congress expressly vested in the courts.

The Eighth Circuit overturned the FCC's ruling regarding the scope of its complaint jurisdiction under § 208. The Court of Appeals held that traditional rules of statutory construction require interpreting Congress's choice of federal district court review of state commission decisions as the exclusive means of review. Pet. App. 31a-32a (citing cases). The absence of any reference in § 252 to FCC review reinforced the court's

---

mediate or arbitrate disputes over remaining terms. 47 U.S.C. § 252(a), (b). Any agreement, whether reached through negotiation or arbitration, must then be submitted to the state commission for final approval before it can be implemented. *Id.* § 252(e).

conclusion in this regard. *See id.* 33a. The Court of Appeals correctly noted:

> The only grant of any review or enforcement authority to the FCC is contained in subsection 252(e)(5), and this provision authorizes the FCC to act only if a state commission fails to fulfill its duties under the Act. The FCC's expansive view of its authority under section 208 is thus contradicted by the language, structure, and design of the Act.

Id. Only after rendering its conclusion based on "the language, structure, and design of the Act," did the Court of Appeals separately and independently hold that § 2(b) of the Communications Act *also* precludes the FCC from exercising authority under § 208 to review state commission decisions on interconnection agreements, because many aspects of those agreements, such as pricing, are outside the FCC's jurisdiction. *See id.* 33a-34a.

It is particularly important for the Mid-Sized and smaller LECs that Congress's expressed desire for reduced regulatory burdens be followed. These LECs are especially vulnerable to efforts by large well-financed entrants to grind them down through multiple and duplicative regulatory proceedings. The FCC cannot ignore Congress's plainly expressed intention that parties to an interconnection agreement need only pass *one* regulatory hurdle – the state commission (with federal district court review, if necessary) – to approve their agreement. The Court of Appeals was therefore correct to reject the FCC's effort to rewrite § 252 by placing review of state commission determinations within the FCC's jurisdiction.

3. Two-percent waiver. Further underscoring Congress's confidence in the states, 47 U.S.C. § 251(f)(2) gives to state commissions alone the authority to suspend or modify the requirements of § 251(b) or (c) in certain circumstances for LECs in their state that serve fewer than two percent of the

nation's subscriber lines.[22] Those circumstances are when the LEC can demonstrate in a petition filed with the state commission that § 251(b) or (c) imposes "a requirement that is unduly economically burdensome."[23] In purporting to apply § 251(f)(2), the FCC issued Rule 405(d), which impermissibly narrows the circumstances under which Congress intended that a smaller LEC may obtain relief from the requirements of § 251. The rule does so by requiring smaller LECs to prove that § 251 requirements "would be likely to cause undue economic burden *beyond the economic burden that is typically associated with efficient competitive entry.*" 47 C.F.R. § 51.405(d) (emphasis added).

In other words, if "efficient competitive entry" – the FCC's concocted phrase – would "typically" cause the demise of the smaller LEC with a strong historical tie to its service area, due to the entry of a multinational competitor with no long-term commitment to that area, the FCC's rule would disable the state commission from even temporarily suspending or modifying any of the requirements of § 251. Yet, that scenario is precisely what Congress intended would satisfy the test of a requirement that is "unduly economically burdensome."[24]

---

[22] Under § 251(f)(2), only LECs with fewer than two percent of the nation's subscriber lines in the aggregate qualify for this "2% waiver" provision. That definition excludes the BOCs and GTE, but includes all of the Mid-Sized LECs. The Mid-Sized LECs have a unique interest in the application of this provision because, unlike smaller, rural LECs that make up the vast majority of LECs in this country, many of the Mid-Sized LECs do not qualify for the automatic rural exemption of 47 U.S.C. § 251(f)(1) – a provision addressed at length in the Brief in Opposition filed by the United States Telephone Association and the Rural Telephone Coalition, which brief the Mid-Sized LECs fully endorse.

[23] The "unduly economically burdensome" test is just one of three alternative tests in § 251(f)(2) for justifying a waiver, but the FCC conceded below that its rules neither address nor purport to limit a LEC's right to resort to the other two tests.

[24] *See Senate Report* at 22 (Senate Committee, in drafting provision that became § 251(f)(2), intended that the "State shall, consistent with the protection of consumers and allowing for competition, use this authority to provide a level playing field, particularly when a company or carrier to

(Footnote continued)

That statutory phrase, and not the one made up by the FCC, governs when a state commission may tailor a requirement to the uniquely local situation, and thereby *enhance* competition by ensuring the local company's survival.

The Eighth Circuit thus vacated the FCC's rule as beyond the FCC's jurisdiction. It did so by applying the plain meaning of § 251(f)(2) as well as by reference to clear legislative history consistent with that meaning. *See* Pet. App. 28a. In enacting the two percent waiver provision, Congress recognized that not all LECs or telephone markets are the same, and that state commissions, not the FCC, had the local knowledge and experience to decide when the Mid-Sized or smaller LECs need relief from particular obligations imposed by the Act. Yet, the FCC arrogated to itself the power to restrict the state commissions' exercise of authority given by Congress, even though the statute gives the FCC *no* role to play in that purely local decision. The FCC also ignored Congress's rejection of earlier versions of § 251(f)(2) that would have created dual FCC/state commission jurisdiction over waivers. *See Senate Report* at 22, 93 (§ 251(i)); *House Report* at 74, 144 (§ 242(e)). In the bill enacted into law, Congress deleted any reference to FCC jurisdiction in § 251(f)(2) and decided instead that waiver decisions requiring a thorough knowledge of the Mid-Sized and smaller LECs should be handled only by state commissions, which are best equipped to make such determinations on a company-by-company basis.[25] The Court of Appeals' reliance on the express statutory text and clear

---

which this subsection applies faces competition from a telecommunications carrier that is a large global or nationwide entity that has financial or technological resources that are significantly greater than the resources of the company or carrier").

[25] Thus, on the day that the Senate passed the Act, Senator Daschle remarked: "The bill before us also recognizes the important role that must be played by Public Utilities Commissions (PUC's) in rural States. PUC's are the best entities to judge whether a given market within their State can support competition. *That's not a judgment we should make from Washington.*" 142 Cong. Rec. S709 (daily ed. Feb. 1, 1996) (emphasis added).

legislative history of § 251(f)(2), as independently supported by § 2(b) of the Communications Act, was clearly correct, and there is, therefore, no reason to disturb that ruling.

4. In the First Report & Order, the FCC paid little attention to the text of the statutory provisions just discussed. That same blindspot is apparent from the FCC's analysis of the pricing provisions of the Act. All of these provisions, both in the statutory language and when viewed as a whole, confirm that Congress did not strip regulatory authority over local telephone service from state utility commissions and hand it over to the FCC. There is, therefore, no reason for this Court to accept petitioners' invitation to grant plenary review of the Eighth Circuit's well-reasoned and balanced decision on these numerous statutory issues.

B. In its second question presented, the FCC separately takes issue with the Eighth Circuit's decision on rehearing regarding the sale of unbundled network elements. Other petitioners present the same question. The briefs in opposition filed by the BOCs and GTE fully address why this Court should not grant review of this question, and the Mid-Sized LECs adopt the arguments in those briefs.[26] This issue is of particular concern to the Mid-Sized and smaller LECs, many of whom depend heavily on the revenues earned from serving a few large companies in their service areas in order to stay in business and serve residences at the lower subsidized retail rate set by their utility commissions. If a new entrant could obtain the incumbent LEC's telephone service at the cost-based rates reserved for unbundled network elements, rather than at the wholesale rate based on the higher retail rate charged to business customers, the new entrant could "cherry pick" the important business customer base and leave the incumbent LEC only with residential customers. This type of

---

[26] Similarly, the Mid-Sized LECs adopt the arguments made by the BOCs and GTE regarding why this Court should not review the question presented by petitioners concerning the FCC's "pick and choose rule."

"cream skimming" would be especially devastating to the Mid-Sized and smaller LECs.

The Eighth Circuit, therefore, correctly decided to vacate FCC Rule 315, 47 C.F.R. § 51.315. Only if new entrants incur the cost attendant to combining network elements purchased on an unbundled basis can "resale" – *i.e.*, the purchase of finished telephone service at wholesale rates – remain a "distinct and attractive option" for new entrants. Pet App. 57a. By preserving the Act's purposeful distinction between the sale of unbundled network elements at cost-based prices and the sale of an incumbent LEC's telephone services at wholesale prices, the Court of Appeals upheld Congress's intent that incumbent LECs not "lose all of the customers to whom they charge higher prices in order to fulfill their current universal service obligations." *Id.*[27]

This Court should therefore decline to review the Court of Appeals' decision on rehearing, which was based on the plain language of the Act and clear legislative intent to ensure that large global concerns cannot skim off the best customers of smaller local telephone companies. If AT&T or other new entrants wish to offer local telephone service through the purchase of unbundled network elements *at cost-based rates*, rather than by purchasing the incumbent LEC's own telephone service *at wholesale rates* and offering it for resale, the new entrant is required by the Act to design and assemble its own transmission network by selecting and purchasing from

---

[27] The House specifically amended its bill going into Conference to ensure that LECs need only provide resale at "wholesale rates" rather than "at economically feasible rates to the reseller." *Compare* 141 Cong. Rec. H8426 (§ 242(a)(3)) (daily ed. Aug. 4, 1995) *with id.* at H8444, col. 2 ("resale" amendment). Representative Dingell explained that the amendment was necessary to eliminate the requirement that "local telephone companies . . . subsidize the long distance competitors," by "requir[ing] service which cost $25 to be sold to AT&T for $6; something which would have caused the necessity of subsidizing, then, AT&T at the expense of small business and local [residential] phone user, an outrageous situation." *Id.* at H8452 (also noting that Reps. Bliley and Fields worked to correct "this failure" in the bill).

the LEC the individual elements and facilities that make up an interoffice transmission network. Anything less would "require the incumbent LECs to do *all* of the work" of new entrants, in violation of the Act. Pet. App. 53a (emphasis in original).

II.

THE EIGHTH CIRCUIT'S DECISION IS NOT IMPEDING THE DEVELOPMENT OF COMPETITION IN LOCAL MARKETS

Each petition argues that certiorari is warranted because the Eighth Circuit's decision stands as an impediment to achieving competitive local telephone markets. Petitioners made identical arguments to this Court over a year ago in seeking to vacate the Eighth Circuit's stay of the pricing provisions of the First Report & Order. FCC Application to Vacate Stay, *Iowa Utilities Bd. v. FCC*, No A-299, at 27 (Oct. 24, 1996); ALTS Application to Vacate Stay, *Iowa Utilities Bd. v. FCC*, No. A-300, at 27-32 (Oct. 24, 1996).

As the facts described in the Statement show, these arguments are even less credible now than they were a year ago. Private negotiations and state commission arbitrations are working as Congress planned to open local telephone markets to competition far more rapidly than has happened with other markets or industries that have been opened to competition after decades as regulated monopolies. It should hardly be surprising that with over 1,700 interconnection agreements and numerous arbitrations, there should be, as petitioners claim, 70-100 review proceedings pending in the federal district courts. *See* AT&T Pet. 10; FCC Pet. 24. Certainly, there is no reason to believe that there would be fewer such proceedings if the Eighth Circuit had, as petitioners argue, upheld the FCC's pricing and other rules, and given the financial stakes, there is also little reason to believe that consideration of the issues presented by the petitions would likely reduce the number of contested arbitrations. Indeed, granting the petitions would only serve to create greater uncertainty in the marketplace, not less. Moreover, as decisions are rendered in

those cases and issues of concern in those local marketplaces are resolved by the local federal courts, as Congress intended, even the relatively small number of federal court review petitions that have been filed to date can be expected to diminish.

All of this progress toward competition in local markets has occurred, and can continue to occur, *without* the FCC dictating pricing methodologies to the state commissions and competing carriers and *without* the FCC preempting every state policy or rule on interconnection and access that differs from the FCC's own rules. As the Eighth Circuit found at the stay stage on the basis of the uncontroverted record before it, petitioners' claims of the calamitous consequences that would supposedly occur if private negotiations and state commission arbitrations are allowed to proceed as Congress envisioned "ignore[ ] the *empirical* success that private parties and the state commissions have had in implementing the local competition provisions of the Act," ignore the fact that this system "has initially proved to be successful," and "denigrate[ ] the proven ability of the state commissions to prevent incumbent LECs from charging excessive rates for their services." *Iowa Utilities Bd.*, 109 F.3d at 427 (emphasis added). *See* excerpt from the *USTA Competition Report* in the appendix to this brief. Respondents urge this Court to allow that "successful" implementation of Congress's plan to continue to proceed without further delay or uncertainty.

CONCLUSION

For the reasons set forth above, the petitions for a writ of certiorari should be denied.

Respectfully submitted,

QUESTIONS PRESENTED

1. Whether, in giving States authority to "establish" and "determin[e]" the rates for local interconnection arrangements (47 U.S.C. § 252(c), (d)) and in providing that "nothing in this Act shall be construed . . . to give the [Federal Communications] Commission jurisdiction" with respect to intrastate matters (*id.* § 152(b)), Congress foreclosed the FCC's claim of jurisdiction to regulate the rates and certain other terms of local interconnection arrangements.

2. Whether the court of appeals correctly applied *Chevron U.S.A. Inc. v. NRDC*, 467 U.S. 837 (1984), in holding that FCC rules requiring incumbent telephone companies to provide their competitors with preassembled combinations of "unbundled network elements" that amount to a finished telecommunications service could not be reconciled with statutory text providing that unbundled network elements must be provided "in a manner that allows *requesting carriers* to combine such elements" (47 U.S.C. § 251(c)(3) (emphasis added)) and with separate statutory provisions governing the resale of finished telecommunications services (*id.* § 251(c)(4)).

3. Whether the court of appeals correctly applied *Chevron* in holding that FCC rules allowing a competitor to force upon an incumbent carrier any isolated provision from any of the incumbent's approved interconnection agreements could not be reconciled with the Act's reliance on voluntary private negotiations and with statutory text providing that incumbent carriers must make such provisions available to other carriers only "upon the same terms and conditions" as in the original agreement (47 U.S.C. § 252(i)).

LIST OF PARTIES AND AFFILIATES

The parties to the proceedings in the United States Court of Appeals for the Eighth Circuit are reproduced at Pet. App. 1a-4a, 73a-78a, and 92a.

Pursuant to Supreme Court Rule 29.6, the parties to this brief submit the following statement concerning parent companies and non-wholly owned subsidiaries:

Ameritech Corporation has no parent companies and no non-wholly owned subsidiaries.

Bell Atlantic Corporation has no parent companies. It owns the following subsidiaries having securities in the hands of the public: Bell Atlantic-Delaware, Inc., Bell Atlantic-Maryland, Inc., Bell Atlantic-New Jersey, Inc., Bell Atlantic-Pennsylvania, Inc., Bell Atlantic-Virginia, Inc., Bell Atlantic-Washington, Inc., Bell Atlantic-West Virginia, Inc., Bell Atlantic Financial Services, Inc., New York Telephone Company, New England Telephone and Telegraph Company, NYNEX Credit Company, NYNEX Capital Funding Company. In addition Bell Atlantic has the following non-wholly owned subsidiaries: One Parkway, Inc., ICA Foreign Financial, Inc., Chesapeake Directory Sales Company, Atlantic West B.V., Grupo Iusacell, S.A. de C.V., Bell Atlantic New Zealand Holdings, Inc., PrimeCo Personal Communications, L.P., Washington, D.C. SMSA Limited Partnership, New York SMSA Limited Partnership, Upstate Cellular Network, Orange County Poughkeepsie MSA Limited Partnership, Pittsfield Cellular Telephone Company, Allentown SMSA Limited Partnership, Reading SMSA Limited Partnership, Pittsburgh SMSA Limited Partnership, Pennsylvania RSA No. 6(II) Limited Partnership, Columbia Cellular Telephone Company, Anderson Cellular Telephone Company, Las Cruces Cellular Company, TELE-TV, TELE-TV Media, L.P., TELE-TV Systems, L.P., NYNEX Master Lease Partners, Global Directory Services Company, MEDIATEL spol. s.r.o., Zlate Stranky MEDIATEL spol. s.r.o., Greek Directory Services Company, NIMCO Commercial

Societe Anonyme of Publication of Directories and of Information Services, Polish Directory Services Company, NYNEX Worldwide Directories Company, Kipling Associates L.L.C., NYNEX International (Asia) Ltd., and Gibraltar NYNEX Communications Limited.

BellSouth Corporation has no parent companies. BellSouth Corporation's non-wholly owned subsidiaries are 1155 Peachtree Associates, InfoVentures of Atlanta, Beijing Ji Tong—Bellsouth Communication & Information Engineering Co., Ltd., Compania de Radiocommunicaciones Moviles S.A., Telcel Celular C.A., Tele 2000, S.A., RAM Mobile Data Belgium, S.C.S., RAM Mobile Data C.V., RAM Mobile Data Limited, BellSouth Carolinas PCS, L.P. (d/b/a BellSouth Mobility DCS), Bloomington Cellular Telephone Company, Chattanooga MSA Limited Partnership, Decatur RSA Limited Partnership, Florida RSA #2B (Indian River) Limited Partnership, Georgia RSA No. 1 Limited Partnership, Georgia RSA No. 2 Limited Partnership, Georgia RSA No. 3 Limited Partnership, Gulf Coast Cellular Telephone Company, Huntsville MSA Limited Partnership, Lafayette MSA Limited Partnership, Los Angeles Cellular Telephone Company, Louisiana RSA No. 7 Cellular General Partnership, MCTA, Muncie Cellular Telephone Company, Inc., Orlando SMSA Limited Partnership, Richmond Cellular Telephone Company, and Terre-Haute Cellular Telephone Company, Inc.

SBC Communications, Inc., which has shares outstanding in the hands of the public, is the parent company of Southwestern Bell Telephone Company and Southwestern Bell Yellow Pages, Inc. SBC Communications Inc. has the following non-wholly owned subsidiaries which have shares or partnership interests outstanding in the hands of the public: Abilene SMSA Limited Partnership, Amarillo SMSA Limited Partnership, Buffalo Telephone Company, Cellular Mobile Corporation, Champaign CellTelco, Dallas SMSA Limited Partnership, Decatur Cellular Telephone Company, Inc., Eastern Missouri Cellular Limited

Partnership, Gainesville Development Associates Limited, Gary Cellular Telephone Company, Kansas City SMSA Limited Partnership, Lubbock SMSA Limited Partnership, McAllen/Edinburgh SMSA Limited Partnership, Midland-Odessa SMSA Limited Partnership, Missouri RSA 8 Limited Partnership, Missouri RSA 9 B1 Limited Partnership, Oklahoma City SMSA Limited Partnership, Oklahoma RSA 3 Limited Partnership, Oklahoma RSA 9 Limited Partnership, PTF/FCLC Associates (LP), PTF/GECC (California) Associates (LP), San Antonio SMSA Limited Partnership, SBMS Cellular Telecommunications Bloomington, Inc., SBMS Cellular Telecommunications Springfield, Inc., S.T.L.M. Programming Services Limited, St. Joseph SMSA Limited Partnership, Texas RSA 9B4 Limited Partnership, Texas RSA 10B1 Limited Partnership, Texas/ Illinois Cellular Limited Partnership, Topeka SMSA Limited Partnership, Washington/Baltimore Cellular Limited Partnership, Wichita SMSA Limited Partnership, and Worcester Telephone Company.

On April 1, 1997, SBC Communications Inc., Pacific Telesis Group ("PAC"), and SBC Communications (NV) Inc., a wholly owned subsidiary of SBC Communications Inc., completed an agreement and plan of merger by the means of which PAC and SBC Communications (NV) Inc. were merged into PAC, and PAC became a wholly owned subsidiary of SBC Communications Inc. PAC, formerly a publicly held corporation, and its wholly owned subsidiaries, Pacific Bell and Nevada Bell, provide telecommunications services subject to the general jurisdiction of the Federal Communications Commission.

U S WEST, Inc., has no parent company. Financial Security Holdings, Ltd. is a non-wholly owned subsidiary of U S WEST, Inc.

On Petitions for a Writ of Certiorari to the United States Court of Appeals for the Eighth Circuit

---

OPPOSITION OF THE REGIONAL BELL COMPANIES TO PETITIONS FOR A WRIT OF CERTIORARI

Ameritech Corporation, Bell Atlantic Corporation, BellSouth Corporation, SBC Communications Inc., and U S WEST, Inc., petitioners below, respectfully oppose the petitions for a writ of certiorari.

Despite the tortuous complexity of the underlying FCC regulations, this case presents, at bottom, only ordinary issues of statutory construction like those the courts of

appeals routinely resolve every day. The Eighth Circuit, relying on the plain text of the Telecommunications Act of 1996 (the "1996 Act") and adhering scrupulously to the principles of *Chevron U.S.A. Inc. v. NRDC*, 467 U.S. 837 (1984), correctly resolved each of these questions and, notwithstanding petitioners' claims to the contrary, there is no circuit conflict as to any aspect of the court's decision.

Nor is there any substance to petitioners' wholly unsupported assertion that the Eighth Circuit's ruling has had catastrophic effects on local competition. Petitioners direct their principal challenge to the court of appeals' jurisdictional holding that the FCC could not, consistent with the governing statutory language and with this Court's decisions, dictate to States the pricing rules for local interconnection arrangements. But in the 14 months since the court of appeals stayed the FCC's intrusive pricing rules, the States have aggressively and successfully implemented the Act's local competition provisions—issuing some 200 arbitration decisions and supervising more than 1,700 interconnection agreements. They have done so, moreover, in a manner compatible with the FCC's own notions of desirable policy. By the FCC's own account, "*virtually every state in the union* has adopted [the FCC's pricing] policies." [1]

The other questions presented by petitioners—which bear no relationship to the jurisdictional issue—deal only with the details of the statute's "unbundling" and most-favored-nation provisions. These second-level statutory issues fall far short of this Court's usual threshold for certiorari.

STATEMENT OF THE CASE

1. Background. For over 60 years, since the enactment of the Communications Act of 1934, Congress has expressly confined the FCC's jurisdiction to interstate and

[1] Reed Hundt, Chairman, Federal Communications Commission, remarks to the Chamber of Commerce, Washington, D.C. (May 29, 1997) (as prepared for delivery) (emphasis added).

foreign communications and has reserved for the States exclusive jurisdiction over intrastate communications. Section 2(b) of the Act provides (with exceptions not relevant here) that "*nothing* in this Act shall be construed to apply *or to give the Commission jurisdiction* with respect to . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service by wire or radio of any carrier," 47 U.S.C. § 152(b) (emphasis added). This Court has squarely held that section 2(b) "fenc[es] off from FCC reach or regulation intrastate matters," and that only an "unambiguous" and "straightforward" grant of specific intrastate jurisdiction to the FCC can "override the command of [§ 2(b)]." *Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355, 370, 377 (1986).

Prior to the current decade, most States exercised their federally guaranteed authority over local telephone service by granting exclusive franchises in each local service area and pervasively regulating these franchised "local exchange carriers" (or "LECs") with an eye to securing affordable "universal service." To keep prices low even for high-cost customers, the States mandated an extensive system of interservice subsidies under which LECs were typically required to charge below-cost rates for basic residential service and above-cost rates for business and other services. The level and structure of these subsidies naturally varied throughout the country depending on each State's local conditions and prevailing social policies.

Interservice subsidy arrangements were economically sustainable only because the States preserved certain legal barriers to entry that prevented competitors from cherry-picking LEC business customers whose above-cost rates fund universal service. In the years leading up to the 1996 Act, however, a number of States began to depart from the exclusive franchise model. Far from being "complicit[]" in preserving "monopolistic local markets" (MCI Pet. 7), these States took the lead in the difficult and inherently localized process of opening up local telephone markets to competition while still ensuring affordable,

high-quality service to all consumers. *See Iowa Utils. Bd. v. FCC*, 109 F.3d 418, 427 n.7 (8th Cir. 1996).

2. The 1996 Act. Building significantly on the work already done by the States, Congress crafted in the 1996 Act a "pro-competitive, de-regulatory national policy framework" designed to "open[] all telecommunications markets to competition." S. Conf. Rep. No. 104-230, at 113 (1996). With respect to local service markets, Congress expressly preempted all State and local legal barriers to entry, such as exclusive franchises. *See* 47 U.S.C. § 253(a). It also required incumbent carriers, on reasonable terms, to interconnect their local networks with the facilities and equipment of competing local carriers, to provide access to elements of their networks on an unbundled basis, and to offer their retail services to competitors for resale at wholesale rates. *Id.* § 251(c).

Recognizing, however, that these steps implicated the intensely local concerns of 50 different jurisdictions—each with its own system of rate structures, regulations, and subsidies—Congress enlisted the aid of State public utility commissions to ensure that local competition would be implemented fairly and with due regard to local conditions. Congress saw the States, *not* as obstructionists to be kept "on a short leash" (MCI Pet. 7), but as critical players in a pro-competitive enterprise.

Congress chose to rely in the first instance on private party negotiations to reach interconnection agreements consistent with the 1996 Act. But where the parties are unable to agree on all issues within a prescribed bargaining period, Congress provided that either party may petition the State commission "to arbitrate any open issues." 47 U.S.C. § 252(b)(1). Most significantly for present purposes, the Act entrusts solely to State commissions the resolution of disputes concerning the crucial question of pricing. It provides that "*a State commission* shall . . . establish any rates for interconnection, services, or network elements," in accordance with the pricing standards spelled out in the statute. *Id.* § 252(c)(2) (emphasis added).

Congress did provide for ultimate federal oversight of State arbitrations, but it chose a judicial, not an administrative, mechanism for this oversight. Once an arbitrated agreement has been finally approved by a State commission, any aggrieved party may bring an action in federal district court to determine whether the decision "meets the requirements of section 251 and [section 252]." *Id.* § 252(e)(6).

In contrast to its broad reliance on private negotiations, State-supervised arbitrations, and federal judicial review, Congress assigned the FCC a specifically delimited role in implementing the Act's local competition provisions. The statute provides that, if a State commission declines to carry out its responsibilities under section 252, the FCC "shall assume the responsibility of the State commission . . . with respect to the proceeding or matter." *Id.* § 252(e)(5). Otherwise, with a few tightly drawn exceptions,[2] Congress scrupulously avoided authorizing the FCC to intrude on the States' traditional jurisdiction exclusively to oversee intrastate telephone service. In particular, Congress gave the FCC *no* responsibilities with respect to the pricing of interconnection arrangements.

3. The FCC's Order. Unwilling to accept its circumscribed role under the new statute, the FCC moved aggressively to transform the deregulatory, State-centered plan Congress enacted into a comprehensive federal regulatory program. In its First Report and Order—a 700-page, 3,200-footnote opus (selected excerpts of which are reproduced at Pet. App. 131a-337a)—the Commission undertook to promulgate "uniform, national rules" ad-

---

[2] For example, Congress gave the FCC "exclusive jurisdiction" over the administration of "telecommunications numbering," including the responsibility to make numbers available "on an equitable basis." 47 U.S.C. § 251(e)(1). It also gave the FCC a role in defining a carrier's duty to provide "number portability," *id.* § 251(b)(2); in determining what network elements should be unbundled, *id.* § 251(d)(2); in prescribing permissible resale restrictions, *id.* § 251(c)(4)(B); and in providing for the treatment of comparable carriers as "incumbents," *id.* § 251(h)(2).

dressing every conceivable local interconnection issue (*id.* at 166a), and it declared those rules "binding on the states, even with respect to intrastate issues" (*id.* at 201a). Although the FCC conceded that the 1996 Act "do[es] not contain an explicit grant of intrastate authority to the Commission" (*id.* at 191a), it nevertheless proclaimed that it had authority "without limitation" (*id.* at 213a) to issue such binding rules because, in its view, the "1996 Act moves beyond the distinction between interstate and intrastate matters that was established in the 1934 Act." *Id.* at 144a. As the FCC's Chairman declared in plainer terms, the 1996 Act tossed the States' traditional intrastate authority into "the trash can of history." [3]

Having asserted unconstrained intrastate authority, the FCC turned its attention to the pricing of local interconnection arrangements. Even though section 252(d) expressly assigns to "State commission[s]" the authority to determine "just and reasonable" rates, the FCC asserted that it nonetheless has jurisdiction to adopt "national pricing rules" and to relegate the States to the subordinate role of mechanically applying those rules. Pet. App. 191a, 210a. The Commission accordingly mandated a new pricing methodology known as "total element long run incremental cost" (or "TELRIC"), which required States to set prices based solely on the incremental, forward-looking cost of a hypothetical, ideally efficient network. *Id.* at 147a. The Commission also required States to apply FCC-prescribed rates (known as "proxy" prices) in all instances where TELRIC studies had not been completed. *Id.* at 147a-48a.

The FCC's Order also contained rules on a wide array of other matters. Two are relevant here.

First, the Commission dismantled the statute's carefully tailored distinction between access to an incumbent carrier's unbundled network elements—which must be priced at "cost" plus "a reasonable profit" (47 U.S.C.

---

[3] Interview with FCC Chairman Reed Hundt, *in* Telecommunications Report, Supplement at 10 (July 9, 1996).

§ 252(d)(1))—and the provision of finished services for resale—which must be priced at the incumbent's "retail rates" less "avoided" costs (*id.* § 252(d)(3)). The FCC ruled that a competitor could purchase at cost-based rates all the elements necessary for the provision of a complete service—and could require the incumbent to provide those elements in *pre-combined form*. Pet. App. 230a-33a, 242a-49a. The FCC's rules therefore allowed a competitor to obtain a finished service at cost-based, unbundled-element rates simply by framing its request in different terms: instead of requesting the incumbent's retail service for resale at wholesale rates under section 251(c)(4), the competitor could simply invoke section 251(c)(3) and demand, in fully preassembled form, all the "unbundled network elements" needed to provide that retail service.

Second, the FCC transformed the 1996 Act's unexceptional most-favored-nation requirement—under which an incumbent must make available to requesting carriers, "upon the same terms and conditions," any interconnection arrangement contained in an approved agreement (47 U.S.C. § 252(i))—into an extreme "pick-and-choose" rule that subverts voluntary negotiations and undermines binding agreements. Under the FCC's Order, a competitor may pluck any isolated provision from any approved interconnection agreement, and may force it upon the incumbent carrier without any obligation to accept the other "terms and conditions" negotiated as part of the same agreement. Pet. App. 261a-62a. Furthermore, a competitor may unilaterally revise even a signed, State-approved agreement by "avail[ing] itself of more advantageous terms and conditions subsequently negotiated by any other [competitor]." *Id.* at 265a.

In a separate order in the same proceeding, the FCC asserted power to dictate to the States the terms and conditions for implementing intrastate "dialing parity"—a system that allows callers to choose a carrier other than their local telephone company without dialing extra digits. *See* 47 U.S.C. §§ 153(15), 251(b)(3). The FCC asserted this power even though Congress directed the

States, not the FCC, to implement dialing parity for intrastate toll calls. *See id.* § 271(e)(2)(B).

4. The Stay Proceedings. Numerous States, as well as many incumbent carriers, petitioned for review of the FCC's Order. Pursuant to 28 U.S.C. § 2112(a)(3), the petitions were consolidated in the Eighth Circuit.

Because the FCC's arrogation of pricing jurisdiction seemed so clearly to usurp authority that Congress granted to the States, a number of States, as well as some private petitioners, sought an interim stay of the FCC's rules pending judicial review. After full briefing and argument, the Eighth Circuit granted the requested stay in October 1996 because of "what appear[ed] to be the rather clear and direct indication [in the statutory text] that the state commissions"—not the FCC—"should establish prices." *Iowa Utils. Bd.*, 109 F.3d at 424.

Making the same arguments that they now present in their petitions for certiorari, the FCC, AT&T, and MCI applied to Justice Thomas to vacate the stay. Justice Thomas denied the applications. 117 S. Ct. 378; 117 S. Ct. 379 (1996). The FCC immediately reapplied to Justice Ginsburg, and AT&T and MCI reapplied to Justice Stevens. The renewed applications were referred to the full Court, which likewise refused to vacate the stay. 117 S. Ct. 429 (1996).

5. The Decision Below. After further briefing and oral argument, the court of appeals confirmed that the language of the 1996 Act "plainly grants the state commissions, not the FCC, the authority to determine the rates involved in the implementation of the local competition provisions of the Act." Pet. App. 14a. Section 252, the court held, "clearly assign[s] jurisdiction" over pricing to the States. *Id.* at 22a. If there were "[a]ny ambiguity," however, it would be resolved by the intrastate jurisdictional proscription of section 2(b), because "the prices that incumbent local exchange carriers may charge their new competitors for interconnection, unbundled access,

and resale . . . qualify as 'charges . . . for or in connection with intrastate communications service.'" *Id.* at 15a.

The Eighth Circuit also addressed a lengthy series of additional challenges to specific FCC rules.[4] Of relevance here, the court determined two respects in which the Commission's rules conflicted with the terms of the statute.

First, the court vacated the FCC's "pick-and-choose" rule because it "conflict[ed] with the Act's design to promote negotiated binding agreements" and was therefore "an unreasonable construction of the Act." *Id.* at 25a, 27a.

Second, the court held that "the FCC's rule requiring incumbent LECs, rather than the requesting carriers, to recombine network elements that are purchased . . . on an unbundled basis . . . cannot be squared with the terms of subsection 251(c)(3)" (*id.* at 52a), which states that "requesting carriers" are to "combine such elements" to provide telecommunications services. In light of that holding, the court concurrently rejected the incumbents' contention that new entrants cannot obtain access to all of the network elements that, when combined by the requesting carrier, are sufficient to provide service. *Id.* at 54a-58a. Because entrants must make an "up-front investment" and incur additional "costs and risks" in combining the elements themselves, the Eighth Circuit reasoned, recombining all the elements needed to provide a complete service would not simply be resale under another name. *Id.* at 56a-57a.

AT&T and others immediately sought to sidestep the Eighth Circuit's ruling on the issue of combining network elements. Citing the court's failure to vacate a particular subsection of the FCC's rules (47 C.F.R. § 51.315(b))—which provided that, "[e]xcept upon request, an incum-

---

[4] Because it vacated the FCC's pricing rules on jurisdictional grounds, the Eighth Circuit found it unnecessary to reach additional claims that those rules were arbitrary and capricious, contrary to the statute, and confiscatory.

bent [carrier] shall not separate requested network elements that the incumbent [carrier] currently combines" (Pet. App. 294a)—AT&T argued in proceedings around the country that it could still skirt the resale pricing rules by obtaining at cost-based prices a "platform" of all the necessary network elements already combined into a complete service by the incumbent.

Once it was alerted to these attempted evasions of its ruling, the Eighth Circuit granted rehearing and vacated the FCC rule at issue as inconsistent with the plain statutory text. The court stated that "§ 251(c)(3) does not permit a new entrant to purchase the incumbent [carrier's] assembled platform(s) of combined network elements"; indeed, if that were allowed, it would "obliterate the careful distinctions Congress has drawn" between resale and unbundled elements. Pet. App. 71a.

In a separate appeal that was briefed and argued independently of the main appeal and that the court decided in a separate opinion, the Eighth Circuit concluded that the FCC lacked jurisdiction to issue mandatory rules governing the States' implementation of "intraLATA toll [*i.e.*, short-haul long-distance] dialing parity." Pet. App. 81a-89a. The court of appeals relied on the express language of section 271(e)(2)(B)—which "indicates that state commissions, not the FCC, have the authority to issue intraLATA dialing parity rules" (Pet. App. 88a)—as well as on this Court's analysis of section 2(b) in *Louisiana PSC*.

ARGUMENT

Each of the issues raised by petitioners is a straightforward matter of statutory construction on which the decision below was plainly correct. But even if there were doubt on that score, the issues would not warrant further review. There is no reason to believe that the court of appeals misunderstood its role under this Court's *Chevron* decision. Petitioners' claims of conflict with respect to individual decisions are so strained as to undermine their credibility. And their assertions that the decision below

has had adverse practical consequences are without foundation; indeed outside of litigation, petitioners themselves have frankly admitted as much.

The Eighth Circuit did not invalidate any part of the 1996 Act, but merely read it to vindicate the States' historical authority over intrastate matters, to preserve the Act's careful distinction between resale and unbundled elements, and to retain the role of voluntary negotiations in reaching interconnection agreements. These statutory rulings—among the many made by the court below—are but the first wave in what will unavoidably be a long series of decisions interpreting this new statute, each of which will have its own claims to importance.

The 1996 Act was enacted less than two years ago by a Congress, most of whose members remain in place. If the Eighth Circuit erred in reading that statute, Congress is in the best position to apply a remedy. There is no reason for this Court to play the role of Special Master in attempting to resolve each such dispute that might arise.

I. THE EIGHTH CIRCUIT'S JURISDICTIONAL RULINGS WERE CORRECT, REST ON THE PLAIN LANGUAGE OF DISCRETE STATUTORY PROVISIONS, AND RAISE NO ISSUE OF NATIONAL IMPORTANCE

The Eighth Circuit did not make a single, sweeping jurisdictional ruling. It made a series of discrete rulings concerning the scope of the FCC's authority to regulate numerous separate aspects of local interconnection arrangements. And, although each of these decisions was reinforced by section 2(b), each turns principally and in the first instance on the proper reading of individual provisions of the 1996 Act.

The most important of these jurisdictional rulings concerns the FCC's attempt to appropriate the State's authority to determine prices. We therefore focus primarily on the pricing issue in the discussion below. The separate oppositions of USTA/RTC and the mid-size LECs—

which also deserve close attention—discuss other jurisdictional rulings that are likewise encompassed within the first question presented in the FCC's petition.

The fact that there is not one jurisdictional issue—but a series of such issues implicating dozens of specific statutory provisions—should weigh heavily in the Court's consideration of whether to grant certiorari. By lumping all these issues under a single heading, petitioners try to create the impression that the Eighth Circuit has issued a core jurisdictional ruling that transcends in importance the proper interpretation of individual statutory provisions. But, as even a cursory review of its opinion shows, the court carefully parsed numerous individual statutory provisions to reach a succession of narrow, and perfectly correct, decisions concerning the 1996 Act's allocation of regulatory jurisdiction between the States and the FCC. These rulings raise no general legal issue, conflict with no other circuit court decisions, and have had no adverse effect on implementation of the 1996 Act. Further review is not warranted.

a. The 1996 Act could hardly be clearer in its assignment of pricing authority. Section 252(c)(2) provides that a "*State commission* shall . . . establish any rates for interconnection, services, or network elements according to subsection (d)" (emphasis added). Section 252(d)(1), entitled "Pricing Standards," in turn specifies that "[d]eterminations by a *State commission* . . . of the just and reasonable rate[s]" for interconnection and network elements shall be "based on the cost . . . of providing" those services and may include a "reasonable profit" (emphasis added). Likewise, section 252(d)(2) specifies that "a *State commission*" shall determine whether a carrier's reciprocal compensation arrangements are just and reasonable, and subsection (d)(3) provides that "a *State commission* shall determine wholesale rates" for resale of an incumbent's retail services (emphasis added). In stark contrast, *no* subsection of section 251 or 252 that discusses pricing even mentions the FCC, much less suggests that

the federal agency has been given authority over these rates.

There is no basis for the FCC's assertion (Pet. 15) that Congress intended to give the States only ministerial powers in a scheme in which the FCC prescribes detailed and binding "methodological" rules. Congress itself enacted the governing "Pricing Standards" in section 252 (d)(1) and assigned to State commissions the task of "establish[ing]" and "determin[ing]" "just and reasonable rates" consistent with those standards. 47 U.S.C. § 252(c), (d). The responsibility to "establish" and "determine" rates in accordance with the statutory standards plainly subsumes the "methodological" function wrongly arrogated by the FCC.[5]

Moreover, as the Eighth Circuit explained (Pet. App. 13a-14a), the structure of section 252(c) strongly bolsters the conclusion that Congress did not intend the States to be subservient to the FCC on pricing matters. Section 252(c) contains a clear dichotomy. Subsection (c)(1) provides that, when States arbitrate matters within the bounds of the FCC's concurrent jurisdiction (such as the availability of unbundled network elements or resale restrictions), they must ensure that the result meets both "the requirements of section 251" *and* "the regulations prescribed by the [FCC] pursuant to section 251." Subsection (c)(2), by contrast, addresses pricing as a separate matter and makes *no* reference to any FCC rules. It provides only that States shall "establish rates . . . *according to subsection (d)*" (emphasis added)—that is, according to the pricing standards set forth in section 252(d). Thus, Congress itself prescribed the standards that State commissions must follow, and it made clear that,

---

[5] In any event, the agency did not stop at creating detailed pricing methodologies; it also adopted specific "proxy prices" that it instructed the States to apply in all instances where they had not completed TELRIC studies. Pet. App. 147a-48a.

with respect to the specific issue of pricing, the States need look only to the statute, not to any FCC rules.[6]

b. The Eighth Circuit correctly concluded that the plain language of section 252 is itself sufficient to preclude the FCC's seizure of pricing jurisdiction. Pet. App. 14a, 22a. It also correctly recognized, however, that if there were "[a]ny ambiguity" that it would be resolved by section 2(b). Pet. App. 15a.[7]

As this Court has held, section 2(b) is a "br[oad]" and "sweeping" "congressional *denial* of power" to the federal agency that "fences off from FCC reach or regulation intrastate matters." *Louisiana Pub. Serv. Comm'n*, 476 U.S. at 370, 373, 374. That provision bars implied federal jurisdiction—the FCC can assert regulatory authority over intrastate matters only if Congress uses language "so unambiguous or straightforward as to override the command of [section 2(b)]." *Id.* at 377. Section 2(b) thus operates both as a substantive limit on FCC authority and as a specific "rule of construction" (*id.* at 373) that necessarily defeats the FCC's claim to *Chevron* deference here (FCC Pet. 16).

Petitioners can point to nothing sufficiently "unambiguous or straightforward" to overcome the plain directive of section 2(b). On the contrary, the FCC has *conceded*

[6] If the FCC were correct that States were required to follow the FCC's pricing rules under section 252(c)(1), Congress would have had no reason to instruct States separately in subsection (c)(2) to establish rates under the standards of subsection (d). *See Walters v. Metropolitan Educ. Enters., Inc.*, 117 S. Ct. 660, 664 (1997) (statute should not be read to render a provision redundant). Moreover, section 252(c)(1) refers only to "regulations prescribed by the Commission pursuant to section 251." The Act's substantive pricing standards are in section 252(d), not section 251.

[7] It is therefore wrong to characterize the section 2(b) analysis as "central to" and "underlying all of" the court's jurisdictional holdings. AT&T Pet. 13. The court rested its pricing decision on the plain terms of section 252; it invoked section 2(b) only as supplementary, not as necessary, support. Yet, all of petitioners' claims of conflict—which themselves are meritless—bear solely on section 2(b) and not at all on the meaning of section 252.

that the 1996 Act "do[es] not contain an explicit grant of intrastate authority to the Commission." Pet. App. 191a. As a consequence, petitioners must argue that section 2(b) has no bearing here. *See* FCC Pet. 18-22. But their arguments are unavailing.

Petitioners contend initially that, because sections 251 and 252 *apply* to intrastate matters, these sections must also give the FCC *jurisdiction* over such matters. But that argument simply misreads the statute. Section 2(b) provides that, in the absence of express contrary direction, nothing in the Act "shall be construed to apply *or* to give the Commission jurisdiction with respect to" intrastate matters. Even if a particular statutory provision expressly "appl[ies]" to intrastate matters, therefore, section 2(b) independently forecloses the FCC's exercise of "jurisdiction" over such matters.

Petitioners alternatively contend that section 2(b) is irrelevant because the same facilities used to provide local telephone service are also used for interstate access services. FCC Pet. 19-23; AT&T Pet. 13-16. As a result, petitioners claim, it would not be "practicable" for the FCC to confine its jurisdiction, as the Act requires, to interstate matters. FCC Pet. 20. The short—and conclusive—answer to this argument is that the *FCC never even mentioned it* in its 700-page First Report and Order. It is well-established that "courts may not accept appellate counsel's *post hoc* rationalizations for agency action." *Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 50 (1993).

In any event, the argument plainly proves too much. Under petitioners' logic, the FCC would have had jurisdiction to impose all of the intrastate regulations at issue in this case, based entirely on its jurisdiction over *interstate* communications, *even before* Congress adopted the 1996 Act. This Court rejected essentially the same extravagant assertion of federal power in *Louisiana PSC*. The FCC there sought to substitute its own nationally uniform depreciation rules for those of the States on the theory

(echoed almost verbatim here) that the telephone equipment at issue was used for both interstate and intrastate calls and that "it makes no sense within the context of the Act to depreciate one piece of property two ways." 476 U.S. at 375. But, observing that "virtually *all* telephone plant that is used to provide intrastate service is also used to provide interstate service" (*id.* at 360 (emphasis added)), this Court *refused* to "confine[]" State regulation (as petitioners ask this Court to do) "to intrastate matters which are separable from and do not substantially affect interstate communication" (*id.* at 373 (internal quotation marks omitted)).

After *Louisiana PSC*, the courts of appeals have consistently rejected similar FCC arguments in other contexts. The settled rule is that preemption may *"not* be justified merely by the dual intrastate and interstate aspects of [a particular service]; the FCC [has] to show that it [can]not separate the interstate and intrastate components of its regulation." *Public Util. Comm'n of Texas v. FCC*, 886 F.2d 1325, 1333 (D.C. Cir. 1989) (emphasis added). To invoke this very limited exception, moreover, the FCC must also demonstrate "with some specificity" that a State's exercise of its intrastate authority makes it literally "impossib[le]" for the FCC to exercise "its own lawful authority over interstate communications." *NARUC v. FCC*, 880 F.2d 422, 429, 430 (D.C. Cir. 1989); *accord California v. FCC*, 905 F.2d 1217, 1243 (9th Cir. 1990).

No such showing has been made or even attempted here. Interconnection for the exchange of local calls, reciprocal compensation for the transport and termination of such calls, and resale of an incumbent's existing local services—the subjects of large portions of the FCC's pricing rules—are purely intrastate matters that lie beyond the FCC's jurisdictional reach even under the agency's own theory. And far from being powerless to regulate interstate aspects of the use of unbundled elements, the FCC has continued to issue regulations governing the

interstate charges that incumbents may levy. *See Competitive Telecom. Ass'n v. FCC*, 117 F.3d 1068 (8th Cir. 1997) (upholding FCC rules on payment of access charges by purchasers of network elements).

c. In an attempt to evade the clear language of sections 252 and 2(b), petitioners resort to a grab-bag of ambiguous, general provisions. Petitioners lean most heavily on section 251(d)(1), which states that "[w]ithin 6 months after the date of enactment of the Telecommunications Act of 1996, the Commission shall complete all actions necessary to establish regulations to implement the requirements of this section." *See* FCC Pet. 11-12, 17-18. That provision merely directs the FCC—which has a history of multi-year rulemaking proceedings—to adopt within six months whatever rules are necessary to implement the requirements for which the FCC was given express responsibility under section 251. *See* Pet. App. 12a. Nothing in this wholly procedural provision confers any new *substantive jurisdiction* on the FCC, and certainly nothing in it overrides section 252's express grant of pricing authority to the States.

When Congress wanted to extend the agency's authority to intrastate matters, it did so explicitly. For example, in section 276 of the 1996 Act, Congress not only directed the FCC to prescribe payphone regulations within nine months, but *also* gave the FCC jurisdiction with respect to "each and every completed *intrastate and interstate* call," and expressly preempted any contrary state regulations. 47 U.S.C. § 276(b), (c) (emphasis added).[8]

Similarly, in the Cable Act (Pub. L. No. 102-385)—to which the FCC itself pointed as a jurisdictional analog in the court of appeals—Congress not only directed the

---

[8] AT&T's claim (AT&T Pet. 20) of a "square conflict" between this case and *Illinois Pub. Telecom. Ass'n v. FCC*, 117 F.3d 555 (D.C. Cir. 1997), simply betrays the weakness of AT&T's request for discretionary review by this Court. That case dealt with section 276, and it is the difference, not the similarity, between that provision and the one at issue here that is illuminating.

Commission to prescribe regulations within 180 days to carry out its responsibilities, but *also* expressly assigned the Commission substantive jurisdiction over the rates to be charged by cable systems (47 U.S.C. § 543(b)(1)(2)), and directed State regulators to follow the FCC's rate regulations. *Id.* § 543(a)(2)(A).

These provisions bring sharply into focus the missing links in the FCC's statutory argument. The 1996 Act assigns the FCC *no* substantive pricing jurisdiction. Instead, Congress entrusted pricing authority entirely to *State commissions*. 47 U.S.C. § 252(c), (d). Nor does the 1996 Act require States to follow any FCC pricing rules. On the contrary, as we have discussed, Congress went out of its way in section 252(c) to specify separately that States are to set rates only "according to subsection (d)."

Petitioners cannot avoid the clear assignment of pricing jurisdiction to the States by relying on the even more general language of section 201(b). Section 201(a) relates only to "interstate or foreign communication," and section 201(b) refers back to "such communication service"—a term that can only signify the same "interstate or foreign" service. Seeking to wrench the last sentence of section 201(b) from this context (FCC Pet. 12-13), petitioners suggest that this one sentence alone (which gives the FCC rulemaking authority to carry out its responsibilities under the Act) applies as well to *intra*state services—even though those services are nowhere mentioned in section 201. But statutory language must be read in context (*King v. St. Vincent's Hosp.*, 502 U.S. 215, 221 (1991)), and the FCC's suggested reading is nonsensical. If an isolated sentence in a provision that deals only with interstate and foreign communications can be read to give the FCC authority over *all intrastate* matters under the Act, then Congress truly wasted its breath when it stated in section 2(b) that "nothing in [the Communications Act] shall be construed . . . to give the Commission jurisdiction with respect to" intrastate matters.

Nor do any of the other provisions petitioners cite confer pricing jurisdiction on the FCC. The Commission wrongly discerns in section 251(d)(2)—which suggests only that the FCC may determine "what network elements should be made available" by incumbent carriers—an implication that Congress intended tacitly to give the FCC plenary intrastate jurisdiction with respect to local interconnection. But no such implication can provide the straightforward or unambiguous authority necessary under *Louisiana PSC*. Similarly, section 251(d)(3)—which provides that the FCC "shall not preclude the enforcement of any regulation, order, or policy of a State" that is consistent with section 251—is an *anti-preemption* provision that actually contradicts the FCC's claim. It presumes that the States, not the FCC, have authority to adopt intrastate access and interconnection regulations, and it specifically protects those State regulations against FCC preemption. Finally, as the Eighth Circuit correctly ruled (Pet. App. 12a-13a, 85a-86a) and as other courts of appeals have consistently held, section 4(i) is merely a "necessary and proper" clause that confers no added jurisdiction. *See California v. FCC*, 905 F.2d at 1240 n.35; *AT&T v. FCC*, 487 F.2d 865, 877 (2d Cir. 1973).[9]

d. There is no substance to the FCC's assertion that, in vindicating the States' historical authority over intrastate matters, the Eighth Circuit's decision threatens to "impede" local competition. FCC Pet. 22. The FCC it-

---

[9] The same jurisdictional analysis applies to the dialing parity issue addressed in the Eighth Circuit's separate ruling. As in the lead case, the statutory language indicates that *States*, not the FCC, were to oversee intrastate dialing parity issues. *See* 47 U.S.C. § 271(e)(2)(B) (specifying the dates by which "a State" may or may not order dialing parity). Furthermore, the FCC was unable to show an unambiguous grant of jurisdiction sufficient to overcome section 2(b). Indeed, in a portion of its order omitted from AT&T's Appendix, the FCC expressly acknowledged that the interstate and intrastate aspects of dialing parity could easily be regulated separately. *See* Second Report and Order, *Implementation of the Local Competition Provisions of the Telecommunications Act of 1996*, 11 FCC Rcd 19392, 19414, ¶ 37 (1996).

self has acknowledged that "virtually every state in the union" has adopted pricing policies compatible with the FCC's own notions.[10] Thus, from petitioners' own perspective, this case amounts to little more than a fight about "who's ahead on some jurisdictional score sheet." [11]

Petitioners complain that it is inefficient to have these matters decided in individual State proceedings subject to federal district court review. But Congress deliberately chose to enact a decentralized scheme that respects the historical role and unique perspective of individual State commissions; it was not willing to turn State commissions into mere field offices of the FCC. As this Court made clear in *Louisiana PSC*, the FCC has no license to preempt State regulation merely because it believes that its own uniform national rules "will best effectuate [the] federal policy." 476 U.S. at 374.

In any event, the argument rests on a false assumption. There is no basis for petitioners' belief that the inevitable (or proper) result of this review process will be a single one-size-fits-all national mandate on every issue. The statute gives the States considerable latitude to make individual policy choices for their citizens within the bounds of the "Pricing Standards" set forth in section 252(d)(1). That is entirely appropriate in a federal system that acknowledges the differing concerns that may arise in different regions and that has for decades relied exclusively on States to set local telephone rates.

---

[10] *See* n.1, *supra*. MCI and AT&T have echoed the point. MCI's Response to Motion for Summary Judgment, *Southwestern Bell Tel. Co. v. AT&T Communications of the Southwest*, No. A-97CA-132-SS, at 7 (W.D. Tex. June 16, 1997); *see also* AT&T's Reply Memorandum in Support of AT&T's Motion for Summary Judgment, No. A-97-CA-132-SS, *Southwestern Bell Tel. Co. v. AT&T Communications of the Southwest*, at 1-2 (W.D Tex. July 1, 1997).

[11] FCC Commissioner Rachelle Chong, *A Forest View from the Mystery Commissioner*, Remarks to the Communications Committee of the National Association of Regulatory Utility Commissioners (Feb. 26, 1997).

II. THE EIGHTH CIRCUIT'S GARDEN-VARIETY *CHEVRON* DETERMINATIONS ARE CORRECT, DO NOT CONFLICT WITH THE DECISION OF ANY OTHER COURT OF APPEALS, AND RAISE NO ISSUES OF NATIONAL IMPORTANCE

In addition to challenging the Eighth Circuit's jurisdictional rulings, petitioners contest the court of appeals' application of well-settled *Chevron* principles to several specific FCC determinations. The Eighth Circuit correctly decided each of these issues, and petitioners can make no claim of a circuit conflict as to the meaning of the statutory provisions in question. However the Court disposes of the jurisdictional issue, these unrelated tag-along issues plainly do not merit further review.

a. Petitioners first attack the Eighth Circuit's determination of what it means to provide access to "unbundled" network elements in a way that allows "requesting carriers" to "combine" those elements to provide a telecommunications service. 47 U.S.C. § 251(c)(3). This issue is not about whether incumbents may "discriminat[e]" against new entrants (MCI Pet. 15) or may engage in "destruction" of their networks (FCC Pet. 28). Rather, the question here is whether AT&T and MCI may evade the Act's resale pricing provisions and thereby subvert Congress's carefully balanced scheme for local entry.

i. Congress enacted two distinct mechanisms by which entrants may use incumbents' facilities to provide service. First, an incumbent must provide access to "network elements"—specific parts of the incumbent's network —"on an unbundled basis at any technically feasible point" and in a "manner that allows requesting carriers to combine such elements in order to provide . . . telecommunications service." 47 U.S.C. § 251(c)(3). In addition, an incumbent must "offer for resale at wholesale rates any telecommunications service that the [incumbent] carrier provides to subscribers who are not telecommunications carriers." *Id.* § 251(c)(4)(A).

Congress also provided different pricing mechanisms for these distinct modes of entry. The rates for unbundled network elements must be "based on the cost . . . of providing" those elements. *Id.* § 252(d)(1). In contrast, the wholesale rates for finished services must be determined "on the basis of the [incumbent's] retail rates charged to subscribers" minus only those costs that "will be avoided" by selling at wholesale. *Id.* § 252(d)(3).

This separate resale pricing rule provides crucial protection for both consumers and incumbents. Most jurisdictions require incumbents to charge below-cost rates for basic service (especially for rural and residential customers), and allow incumbents to offset those under-recoveries by charging above-cost rates to business and other customers. If new entrants—who, unlike incumbents, have no obligation to serve (and no interest in serving) these rural and residential customers—could obtain complete services at cost-based rates, they could easily siphon away the incumbents' valuable business customers, not by providing a better or lower cost service, but simply by undercutting the above-cost rates that incumbents must charge to subsidize their other services. Such regulatory arbitrage would lead to massive pressure on basic service rates and enormous losses for incumbents. By pegging resale prices to *retail* rates, Congress sought to preserve whatever contribution retail rates make to defray the cost of below-cost services. *See* H.R. Rep. No. 104-204, at 72 (1995) ("The [resale] rate should reflect whether, and to what extent, the local dialtone service is subsidized by other services . . . .").

Ever since Congress passed the 1996 Act, however, AT&T and MCI have continually tried to avoid this crucial pricing restriction, insisting that they can obtain the equivalent of a complete service for resale simply by demanding all of the incumbent's combined network elements at cost-based rates. AT&T's President has openly admitted that this gives competitors simply *"another way to resell"*—one that results in discounts of "52 percent" or

more, in contrast to State-determined resale discounts in the range of 15-25 percent.[12]

The FCC's rules facilitated these attempts to circumvent the resale pricing rules. They (1) permitted entrants to pay cost-based network element rates even when the entrant wants to rely exclusively on the incumbent's network elements to recreate an existing end-to-end service, *and* (2) allowed entrants to obtain network elements *already combined* by the incumbent, so that the entrant need do no work to combine the elements into a finished service but instead can simply order the incumbent's finished service in the form of a preassembled combination of network elements. *See* Pet. App. 230a-33a, 242a-49a.

Although incumbent LECs challenged both of those determinations, the Eighth Circuit sustained those challenges only in part. In a ruling barely mentioned by petitioners, the court of appeals concluded that entrants could obtain, at cost-based rates, all the elements necessary to reproduce an existing retail service. Pet. App. 53a-58a.[13] Recognizing that it must avoid rendering the resale pricing provision superfluous, however, the court tied its ruling on this issue to its prior determination that the FCC could not lawfully require incumbents to combine these "unbundled" elements on behalf of new entrants. *Id.* at 52a-53a. As the Court explained, "requiring the requesting carriers to combine the elements themselves" ensures that entrants bear "the costs and risks associated with unbundled access" and do not simply engage in resale by another name and at another price. *Id.* at 56a-57a.

Despite that holding, AT&T and other competitors continued to argue in proceedings across the country that they were entitled to demand a fully preassembled "plat-

---

[12] Transcript, AT&T Investment Community Meeting (Mar. 3, 1997) (comments of John Zeglis) (emphasis added).

[13] The parties to this brief intend to file shortly a Conditional Cross-Petition on this issue.

form" of unbundled network elements—the equivalent of an end-to-end service—at cost-based rates. They pointed to the Eighth Circuit's failure to vacate a subsection of the FCC's rules prohibiting an incumbent from "separating" elements that it "currently combines." 47 C.F.R. § 51.315(b) (Pet. App. 294a).

When the issue was brought to the Eighth Circuit's attention on rehearing, the court vacated section 51.315(b) for the same reasons that it had already vacated sections 51.315(c)-(f). The court explained that, like these other provisions, section 51.315(b) (at least as then-interpreted by the FCC, AT&T, and MCI) was inconsistent with the express terms of the statute, which provides that "requesting carriers" are to "combine" unbundled elements. Pet. App. 70a-71a. The rule also made the separate statutory resale provisions meaningless:

> To permit such an acquisition of already combined elements at cost based rates or for unbundled access would obliterate the careful distinctions Congress has drawn in subsections 251(c)(3) and (4) between access to unbundled network elements on the one hand and the purchase at wholesale rates of an incumbent's telecommunications retail services for resale on the other.

Id. at 71a.

ii. The Eighth Circuit's analysis does not warrant further review. As an initial matter, there is no basis for petitioners' suggestion that the court's decision conflicts with the decisions of other courts of appeals. No other court has decided whether section 51.315(b) of the Commission's rules conflicts with the language and structure of the 1996 Act. Indeed, no other court has even ruled upon the scope and meaning of section 251(c)(3)'s requirement that incumbents provide new entrants with "nondiscriminatory access to network elements on an unbundled basis at any technically feasible point."

Given the absence of any direct conflict, petitioners attempt to argue that the term "unbundled" has been used

in other regulatory contexts to refer only to separate prices. FCC Pet. 26-27; MCI Pet. 17-18; AT&T Pet. 23-24. But, once again, this argument was never made in the FCC's Order. Indeed, it is flatly inconsistent with what the FCC actually said in the Order, where it read the "unbundling" requirement of section 251(c)(3) to mean that "incumbent LECs must provide [new] carriers with the functionality of a particular element, *separate* from the functionality of other elements, *and* must charge a separate fee for each element." Pet. App. 225a (emphasis added). In other words, just as the court of appeals held, each unbundled network element must not only bear a separate fee, but also must actually be separated from other elements.

The text of section 251(c)(3) is not susceptible to any other reading. Congress spoke of providing "*access* to network elements on an unbundled basis at any *technically feasible point*" and in a "manner that allows *requesting carriers* to *combine* such elements." 47 U.S.C. § 251(c)(3) (emphasis added). Petitioners cannot square their argument with that language. As petitioners understand unbundling, there is no need to obtain "access" at any point because they can obtain supposedly "unbundled" elements already combined into a complete service. Even more obviously, as the Eighth Circuit emphasized, petitioners' claim that they may demand access to already combined elements collides with Congress's express statement that the "requesting carrier[]" itself, not the incumbent, is expected to combine the incumbent's unbundled elements.

The Eighth Circuit's conclusion on this point, moreover, is fortified by the language of related statutory provisions. Under the 1996 Act, incumbents must permit "physical collocation"—that is, installation of a competitor's equipment on the incumbents' premises—"for interconnection or access to unbundled network elements." 47 U.S.C. § 251(e)(6). Congress would have had no need to require physical collocation for this purpose if unbundling were merely a pricing concept.

The Eighth Circuit's ruling is also consistent with the 1996 Act's scheme for local competitive entry. By taking the language of subsection (c)(3) at face value—and thus requiring a new entrant to undertake real work and investment to construct or fill in its own network based on the incumbent's unbundled network elements—the court of appeals preserved the crucial distinction between access to unbundled network elements under section 251(c)(3) and resale under section 251(c)(4). The Eighth Circuit's decision was thus based not on a mere "policy rationale" (MCI Pet. 19), but rather on the court's duty to " 'give effect, if possible, to every clause and word' " that Congress enacted. *Bennett v. Spear*, 117 S. Ct. 1154, 1166 (1997) (quoting *United States v. Menasche*, 348 U.S. 528, 538 (1955)).[14]

iii. Petitioners' position is not strengthened by their hyperbolic claims of harm. As petitioners well know, incumbents are fully prepared to allow them access to the incumbents' complete networks with all elements combined. All AT&T and MCI have to do is ask. That service, however, is known as resale, and resale rates apply. Alternatively, if AT&T and MCI want parts of the incumbents' networks, they can have that too. They simply have to undertake the work necessary to combine the network elements themselves. In sum, the only "harm" here is to a few companies' ability to undermine the Act.

---

[14] It is no answer to this point to suggest vaguely that there are differences in the risks associated with the use of unbundled elements and those related to resale. The simple fact—admitted by AT&T's own witnesses—is that when an entrant purchases combined network elements, it simply uses different words in asking for the service. *See, e.g., Interconnection Agreement Negotiations*, Docket No. 96-AD-559 (Miss. PSC Feb. 10, 1997), Transcript at 25 (Testimony of Joseph Gillan) (AT&T witness answers "that is true" when asked whether, under AT&T's theory, "you could call up BellSouth and say . . . I want to order all of the component elements, we won't go through [the] process of unbundling and rebundling, I'll just order all the elements that make up that service and you charge me the unbundled network element cost").

That is why new entrants with their own competing local facilities oppose the position taken by MCI and AT&T here. As one competitor stated, the Eighth Circuit "made the right decision": those demanding that incumbents reassemble network elements for new entrants are part of a "rear-guard action being fought by the big long distance carriers to essentially get in there and not have to make any investment." [15] Another facilities-based competitor echoed the point: true local competitors "owe[] a debt of gratitude to the Eighth Circuit. . . . The fact that there will be no free ride for interexchange carriers seeking a cheap method of local market entry is a plus for our industry." [16]

In any event, the FCC's General Counsel stated just last month that there was "no reason" that State commissions could not act under their own authority to require incumbents to provide combined network elements.[17] AT&T and MCI have urged State commissions to do just that.[18] Although we vigorously disagree with these assertions, they show that the extent to which petitioners may ultimately obtain what they seek will be determined in future litigation. Until that question of State authority is resolved, the legal issue here will not be settled and the effect of the Eighth Circuit's ruling on entrants will not be finally known.

Moreover, the FCC relied upon section 51.315(b), prior to its vacatur, to support new regulations requiring

---

[15] Communications Daily, at 2 (Dec. 10, 1997) (quoting Royce Holland, Chairman of Allegiance Telecom).

[16] Telecommunications Reports, at 18 (Nov. 10, 1997) (quoting James Allen, CEO of Brooks Fiber Properties, Inc.).

[17] Communications Daily, at 3 (Nov. 20, 1997) (statement of Christopher Wright).

[18] *See, e.g.*, Initial Post Argument Brief of AT&T Communications of Illinois, Inc., ICC Dkt. No. 96-0486, at 5 (Nov. 3, 1997); Post Oral Argument Reply Brief of MCI Telecommunications Corp., ICC Dkt. No. 96-0486, at 8 (Nov. 10, 1997).

incumbents to provide what the Commission called "shared transport"—which actually is a preassembled combination of most of the network elements in the incumbent's network.[19] The FCC's "shared transport" regulations are currently on review before the Eighth Circuit, and the court's decision in that case will determine in large measure the practical effect of its earlier decision vacating section 51.315(b).

In short, petitioners are not only wrong on the law; by their own account, they are premature in bringing this issue to this Court.

b. Finally, petitioners contest the Eighth Circuit's invalidation of the FCC's "pick-and-choose" rule, which precluded effective negotiation of binding agreements by allowing new entrants "to choose among individual provisions contained in publicly filed interconnection agreements" without accepting the other terms of that agreement. Pet. App. 261a.

The Eighth Circuit correctly held that the statute requires nothing like that bizarre result. Section 252(i) provides only that an incumbent LEC "shall make available" in the negotiating process "any interconnection, service, or network element" that it provides under an approved agreement with any other carrier "*upon the same terms and conditions* as those provided in the agreement" (emphasis added). Contrary to petitioners' claim (FCC Pet. 29), that text establishes a straightforward nondiscrimination principle: An incumbent must put on the bargaining table for negotiation any item contained in another agreement, but *only* on the "same terms and conditions"—all the same tradeoffs—that appear in that other agreement. That ensures that a second entrant can step into the shoes of an earlier one if it wishes to accept the

---

[19] *See* Third Order on Reconsideration, *Local Competition Provisions of the Telecommunications Act of 1996*, CC Docket No. 96-98 (Aug. 18, 1997).

deal that the earlier one has struck. It certainly does *not* mean that the second entrant can take what it likes from a prior agreement and leave behind what it doesn't like.

As the FCC would have it, a competitor may demand for itself a new term from another agreement at *any* time, even after it has already signed a different contract with the incumbent. But, as this Court has recognized, a contract that gives one party unfettered discretion " 'to deny or change the effect of the promise[] is an absurdity.' " *United States Trust Co. v. New Jersey*, 431 U.S. 1, 25 n.23 (1977) (quoting *Murray v. Charleston*, 96 U.S. 432, 445 (1878)). An agency rule that reads a statute to require such a result is equally absurd, especially in the context of a statute that expressly relies on private negotiation to establish "binding agreement[s]." 47 U.S.C. § 252(a)(1).

CONCLUSION

The petitions for a writ of certiorari should be denied.

Question Presented

Whether the United States Court of Appeals for the Eighth Circuit correctly held that the Telecommunications Act of 1996 does not grant the Federal Communications Commission the authority to dictate local pricing standards to the State commissions?

JOINT BRIEF FOR STATE COMMISSION RESPONDENTS AND THE NATIONAL ASSOCIATION OF REGULATORY UTILITY COMMISSIONERS IN OPPOSITION

Opinions Below

The principal opinion of the Court of Appeals in *Iowa Utils. Bd. v. FCC* is reported at 120 F.3d 753 and is reproduced in the Appendix to the Petition for Certiorari at 1a-67a. The court's order on rehearing is not yet reported. The opinion of the Court of Appeals in *California v. FCC* is reported at 124 F.3d 934. The First Report and Order of the Federal Communications Commission (FCC) is reported at 11 FCC Rcd. 15,499, and the Second Report and Order of the FCC is reported at 11 FCC Rcd. 19,392.

Jurisdiction

The judgment of the Court of Appeals in *Iowa Utils. Bd.* was entered on July 18, 1997. A subsequent order in that case, granting rehearing in part and denying rehearing in part, was issued on October 14, 1997. The judgment in *California v. FCC* was entered on August 22, 1997. Petitions for a writ of certiorari were filed between November 17 and November 19, 1997. This Court has jurisdiction pursuant to 28 U.S.C. 1254(1).

Statement of the Case

In February, 1996 Congress passed the Telecommunications Act of 1996, which adopted a framework to open all local telecommunications markets to competition. Publ L. No. 104-104, 110 Stat. 56, *codified at and amending* the Communica-

tions Act of 1934, 47 U.S.C. section 151, *et seq.* (1996).[1] In lieu of active regulation, Congress sought to rely primarily on private negotiations between competitors to resolve the broad range of technical and pricing issues associated with interconnection and access to a local exchange carrier's facilities and services. To the extent that negotiations fail, carriers may request State commissions to mediate or arbitrate disputes.

The Act establishes specific pricing standards under section 252(d) that are to be used by the State commissions in the event parties cannot agree on prices and seek arbitration under section 252(b). Final agreements, whether voluntarily negotiated or adopted through arbitration, are brought before State commissions for approval. Only if a State commission demonstrably fails to carry out its responsibility under section 252 is the FCC empowered to "assume the responsibility of the State commission. . . ." 47 U.S.C. section 252(e)(5). In other words, FCC jurisdiction attaches *only* if the state fails to act.

The Act does alter narrow aspects of state and federal jurisdiction by granting the FCC rulemaking jurisdiction over several matters historically regulated by the states. *See* sections 251(b)(2), 251(c)(4)(B), 251(d)(2), 251(e), 251(g) and 251(h)(2). However, the Act does not alter the fundamental, dual jurisdictional scheme codified decades ago in section 2 of

---

[1] According to the FCC, today some 92 percent of telephone calls are intrastate or local in nature and only 8 percent are interstate in nature. Statistics of Communications Carriers (FCC, 1994), at 22. The telephone network, while used predominately for intrastate calls, carries both interstate and intrastate calls. It has been and will remain a dual-use network.

the Communications Act, 47 U.S.C. section 152.[2] The legislative history of the Telecommunications Act makes it clear that apart from the narrow areas where it expressly provided to the contrary, Congress intentionally chose to leave the Act subject to section 152(b). The provisions requiring the FCC to engage in the jurisdictional separation of telephone service costs into interstate and intrastate components for ratemaking purposes also remained in place. *See* 47 U.S.C. sections 221(c) and 410(c).

On August 8, 1996, six months after passage of the Act, the FCC released two orders on local competition, *In re Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, 11 FCC Rcd.15,499(1996) (First Report and Order), and *In re Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, 11 FCC Rcd. 19,392 (1996) (Second Report and Order). In the First Report and Order (First R&O), the FCC found that sections 251, 252, and 253 of the 1996 Act required it to establish rules to govern interstate and intrastate prices for unbundled network elements, interconnection, resale, collocation, and termination of transport. (Pet. App. 190a) It asserted that the 1996 Act created a "parallel" jurisdictional scheme for the FCC over both interstate and intrastate matters under sections 251 and 252. (Pet. App. 191a). It also contended that section 152(b) did not preclude FCC regulations governing intrastate matters and that Congress intended it to adopt national rules for the states to follow in implementing the 1996 Act. (Pet. App. 192a-193a). This analysis was also the jurisdictional basis for the Second Report

---

[2] Section 152(a) grants the FCC exclusive jurisdiction over interstate communications, while section 152(b) gives the states exclusive jurisdiction over intrastate matters. Section 152(b) specifically states "[N]othing in this Act shall be construed to apply or to give the [Federal Communications] Commission jurisdiction with respect to charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service by wire. . .of any carrier."

and Order. (Pet. App. 341a). Under the FCC's interpretation, nearly all meaningful intrastate rate jurisdiction was effectively removed from State commissions.

It was these findings that 33 States and the National Association of Regulatory Utility Commissioners disputed, seeking review in a number of federal circuits. The petitions contesting the First R&O were consolidated and assigned by lottery to the Eighth Circuit. *See* 28 U.S.C. 2112(a)(3).

Little more than one year ago, the Eighth Circuit Court of Appeals, at the urging of four States and several incumbent local exchange carriers, stayed the effectiveness of the FCC's extensive First R&O rules setting national pricing standards for interconnection. *Iowa Utils. Bd. v. FCC*, 109 F.3d 418 (8th Cir. 1996). In staying those rules the Eighth Circuit found the FCC had exceeded its jurisdiction by promulgating pricing rules regarding local telephone service. The Court stated:

> In this first look at the issue, we are skeptical that the FCC's roundabout construction of the statute could override what, at first blush, appears to be a rather clear and direct indication in subsections 252(c)(2) and 252(d) that the state commissions should establish prices.

Id. at 424.

Immediately following the issuance of the stay, the Acting Solicitor General, on behalf of the FCC filed with the Supreme Court an application seeking a vacation of the stay.[3] The

---

[3] Both AT&T and MCI in their respective statements of the case fail to mention the unsuccessful appeals to the Supreme Court for vacation of the stay.

application raised substantially the same arguments brought before this Court in the pending petitions for certiorari.[4] Without opinion, the Court denied the applications filed by the FCC and several other parties to lift the stay. *See FCC v. Iowa Utils. Bd.*, 117 S.Ct. 378, 379 (1996) (Thomas, J., in chambers), *motion to vacate denied* 117 S.Ct. 429 (1996). The case reviewing the First R&O progressed to an expedited ruling on the merits, confirming the earlier jurisdictional ruling on the stay (Pet App. 1a-67a).

The Telecommunications Act of 1996 has been in effect since February of 1996. State commissions have met each of the deadlines and responsibilities imposed by the Act. As indicated in a report compiled by the National Association of Regulatory Utility Commissioners and published in September of this year[5], State commissions have certified more than 1110 new competitors to provide local service. Over 180 arbitrations have been completed following the process set out in section 252(b). Over 500 interconnection agreements have been approved pursuant to section 252(d) and are available as a framework for providing local service. The transition has

---

[4] A close comparison of the arguments advanced by the Acting Solicitor General in its "Application to Vacate a Stay Entered by the United States Court of Appeal for the Eighth Circuit" with this petition for certiorari shows a recycled effort. For example, the arguments contained in the section entitled "Reasons for Granting the Petition" beginning on page 11 of the petition through page 18 and pages 22 through 24 are nearly identical to arguments advanced to and considered by this Court one year ago. Indeed, many of the arguments in the FCC's petition are taken verbatim from that pleading.

[5] See "Telecommunications Competition 1997, A State-By-State Report on Pro-Competitive Measures in Intrastate Telecommunications," NARUC 1997.

begun and the basic building blocks envisioned by the Act are being put in place according to the schedule set out in the Act.[6]

Reasons for Denying the Petitions

Each of the petitions for certiorari implies that the Telecommunications Act of 1996, as interpreted by the Eighth Circuit, is not workable and that the states are both unable and unwilling to bring competition into the local markets. The progress made since the passage of the Act belies these assertions and demonstrates that a decision granting certiorari could actually delay competition.[7]

The FCC, and other petitioners, argue that the Eighth Circuit's vacation of the FCC's pricing methodology "has deprived the district courts of a national regulatory framework within which to review state arbitration proceedings and has relegated many of the fundamental disputes . . . to piecemeal litigation in disparate [district court] proceedings throughout the United States. (FCC petition at p. 23). These allegations lack merit. District courts and States are bound by the "national regulatory framework" specified in the statute.[8] In

---

[6] Again, there has not been a case where the state failed to act which would have allowed FCC action pursuant to section 252(e)(5).

[7] For example, reinstatement of the FCC rules could require reevaluation of existing agreements as well as a remand of the arbitration agreements currently under review to ensure formal compliance with the FCC's methodology.

[8] Subsection 252(d), captioned "Pricing Standards", requires "[d]eterminations *by a State Commission* of the just and reasonable rates for the interconnection of facilities . . .and. . .for network elements. . ." be in accordance with the statute's listed terms. (emphasis added)

requiring local district court review,[9] Congress implicitly acknowledged, that, beyond the Act's pricing standards, other issues arising with respect to interconnection, are questions of fact. Moreover, the other broad, non-price issues the FCC's original orders seek to implement are not being subjected to "piecemeal litigation." Both decisions under review provide guidance to the district courts on the majority of these issues.

In support of a claim that the FCC can best bring about competition, AT&T and MCI repeatedly imply the FCC has pushed competition in local markets whenever possible, and the States have been recalcitrant. The record is replete with examples of States' pro-competitive efforts predating the Act. In fact, the FCC recognized that States' efforts to promote competition predated a national approach and the Act borrowed extensively from state initiatives. (Pet. App. 155a-157a, 165a-166a).

In any event, the issue is not whether the States or FCC have been more pro-competitive or whether the States or federal government are more capable of bringing competition to the local market, but whether Congress assigned responsibility to the FCC to dictate a single set of local rate standards. As this Court stated in *Louisiana Public Serv. Comm'n v. FCC*, 476 U.S. 355 (1986):

> [W]e do not assess the wisdom of the asserted federal policy of encouraging competition within the telecom-

---

[9] Several states, citing the Eleventh Amendment, have challenged the jurisdiction of the federal courts over State commissions in such cases. *See e.g., US WEST Communications, Inc. v. Thoms*, Civil No. 4-97-CV-70082, slip op. (S.D. Iowa Aug. 4, 1997); *U S WEST Communications, Inc. v. Reinbold*, Civil No. A1-97-25, slip op. (D. N.D. Jul. 28, 1997); *U S WEST Communications, Inc. v. TCG Seattle*, No. C97-354WD, slip op. (W.D. Wash. Jul. 24, 1997).

> munications industry. Nor do [w]e consider whether the FCC should have the authority to enforce as it sees fit, practices which it believes would best effectuate this purpose. Important as these issues may be, our task is simply to determine where Congress *has* placed the responsibility. . . "

476 U.S. at 359 (1986).

Once the arguments regarding competitive policy are stripped away, it is clear this Court should deny certiorari. The Eighth Circuit decisions that responsibility for determining prices was expressly granted to the States by Congress are demonstrably correct, and the decisions do not conflict with the decisions of other federal circuits.

I.

THE EIGHTH CIRCUIT'S DECISIONS ARE CORRECT

The petitioners attempt to discredit the Eighth Circuit's analysis on local pricing standards by claiming it "rests on a basic misunderstanding of the telecommunications system and telecommunications law."[10] (FCC petition at p. 19). There is absolutely nothing in the Eighth Circuit's decisions concerning jurisdiction that reflects a misunderstanding of either the

---

[10] The FCC went as far as to entreat this Court to take this case and "not allow the outcome of this case, with its enormous nationwide implications, to depend on which circuit happened to be selected in a jurisdictional lottery." (FCC petition at p. 22).

telecommunications system or the Act.[11] Petitioners' rhetoric aside, the Eighth Circuit's statutory analyses rest on two, rock-solid bases: first, the plain meaning of the statute, and second, application of the principles articulated by this Court in *Louisiana.*

The Eighth Circuit found that the Act plainly grants the State Commissions, not the FCC, the authority to determine the rates involved in the implementation of the local competition provisions of the Act. (Pet. App. 10a-15a). The Act assigns no local ratesetting responsibilities to the FCC. Section 251(c) makes no mention of FCC rate regulations. In direct contrast, subsection 252(c)(1) and (2) set forth the standards State commissions must apply in arbitrations when deciding disputes over rates.[12]

The FCC relies heavily on the directive outlined in section 251(d)(1) that it "complete all actions necessary to establish regulations to implement the requirements of this section." However, section 251(d)(1) calls for rules only in the circumscribed areas where Congress has specifically directed the FCC to act. *See* sections 251(b)(2), 251(c)(4)(B), 251(d)(2), 251(e), 251(g) and 251(h)(2). Had Congress expected the

---

[11] If anything, it is the FCC's petition that evidences not only a misunderstanding of the Act, but a disregard for even the FCC's own prior statements. For example, the FCC's petition claims "interstate charges (*e.g.*, subscriber line charges) determined by the FCC ..." have long been a component of local retail rates. (FCC petition at p. 19). This allegation stands in stark contrast to the FCC's insistence in the First R&O that the "subscriber line charge is a component of interstate access rates, not of intrastate local service rates." (First R&O, para. 984).

[12] In setting rates, States are directed to follow only the standards outlined in section 252(d). The 251(c)(2)(D) obligation that incumbent local exchange carriers provide interconnection at rates that are just and reasonable requires that these rates conform to the prices set by the States under 252(d).

FCC to set all rules necessary for the carriers to meet their obligations, section 251(d)(1) would have explicitly stated that the FCC rules extended to all regulation necessary to implement section 251.[13]

The FCC claims in its petition that Congress was "quite clear in granting the Commission authority to implement the core provisions of Section 251, including the dialing parity provision of Section 251(b)(3) and the pricing provisions of Section 251(c)."[14] (FCC petition at p. 16). However, the FCC's arguments are based on a convoluted reading of various sections of the Act, illogical assumptions, unfounded implications[15] and a demand for deference to preempt areas traditionally regulated by the states.[16]

---

[13] Moreover, it would have directed in section 252(d), the pricing provision, that the FCC make the determinations regarding just and reasonable rates for the purpose of section 251, or it would have directed the states to follow the FCC's rules in resolving disputes subject to arbitration.

[14] The FCC previously acknowledged that sections 251 and 252 do not contain an explicit grant of intrastate authority to the FCC. (Pet. App. 191a).

[15] For example, on page 13 of its petition, the FCC states "Section 251(d)(2) *assumes* that the Commission has jurisdiction to implement Section 251(c)(3)." On page 14, it states "*[b]y obvious implication* Section 251(d)(3) *presupposes* that the Commission does have authority . . . to preempt state laws. . . ." (emphasis provided)

[16] This Court consistently has articulated a stringent legal standard for determining whether federal law preempts state law. Where federal action preempts activities traditionally regulated by the states, such as local telephone services, the Court "'start[s] with the assumption that the historic police powers of the States were not to be superseded. . . unless that was the clear and manifest purpose of Congress.'" *Hillsborough County v. Automated Medical Laboratories, Inc.*, 105 S.Ct. 2371, 2376 (1985) (quoting *Jones v. Rath Packing Co.*, 430 U.S. 519, 525 (1977); *Arkansas Electric Cooperative Corp. v. Arkansas Public Service Commission*, 461 U.S. 375, 377 (1983).

Any ambiguity regarding the FCC's lack of authority over local telecommunications is resolved by following this Court's directive on the operation of section 152(b). *See Louisiana* at 377. As this Court stated, section 152(b) constitutes an "explicit congressional denial of power to the FCC." *Id.* To override this reservation of intrastate authority in section 152(b) requires "unambiguous and straightforward" authority over intrastate matters or a modification of section 152(b).[17] *Id.*

Moreover, section 601(c) of the Act states the FCC cannot rely on an implicit grant of authority to make rules over exclusively intrastate matters. Congress would not have been so oblique if it intended a major shift in regulation of the local market. Finally, deference for an agency construction is improper where the statute is clear. *Chevron U.S.A. Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837 (1984).

---

[17] The FCC's petition claims that Congress' retention of section 152(b) was non-substantive. (FCC pet. at p. 18, n. 8). By the FCC's own admission, early drafts of the Act would have expressly excepted Title II, and thus sections 251 and 252, from the applicability of section 152(b). (Pet. App. 187a, 197a). However, the final version of the 1996 Act omitted the express exception. The only reasonable inference to be drawn is that, apart from the narrow areas where it expressly provided to the contrary, Congress consciously chose to leave the Act subject to section 152(b). *See Rusello v. United States*, 464 U.S. 16, 23-24 (1983).

II

THE HOLDING IN THE EIGHTH CIRCUIT DOES NOT CONFLICT WITH DECISIONS IN OTHER CIRCUITS

The petitioners allege a conflict among circuits as a result of the Eighth Circuit's decision. No conflict exists;[18] indeed, no other court has even ruled on the jurisdictional boundaries of sections 251 and 252 in the 1996 Act.[19]

In support of its claim of a conflict, the FCC contends that other courts have held section 152(b)'s jurisdictional separation to be of limited force because the same facilities are used to provide local and interstate services. (FCC Pet. at pp. 20-21). We know of no court that has accepted such a claim. Moreover, this Court has specifically rejected the same argument. *Louisiana,* 476 U.S. at 373.

The petitioners rely on cases applying an "impossibility" exception to section 152(b) to allege a conflict.[20] That narrow

---

[18] The FCC admits as much when it cites to conflicts with decisions of courts of appeals in "analogous" cases (FCC petition at p. 19) and states there is a conflict "in principle." (FCC petition at p. 20).

[19] The DC Circuit issued a ruling on jurisdiction over payphones under an entirely separate section of the Act. *See* section 276. *Illinois Pub. Telecomm. Assn. v. FCC*, 117 F.3d 555 (D.C.Cir. 1997).

[20] The FCC's reliance on the impossibility exception as the basis for its authority did not surface until the issue was briefed before the Eighth Circuit. Nowhere, in its nearly 700 page First Report and Order, did the FCC even imply that its authority derived from the inability to separate the interstate aspects of ratemaking from the intrastate.

exception, also articulated in *Louisiana*, states that section 152(b) does not apply if the FCC has been assigned an express duty by Congress that it cannot carry out without preemption because it is impossible to separate the focus of that duty from state regulation. 476 U.S. at 376 n. 4. In that extraordinary situation, it is reasonable to assume that Congress did not intend section 152(b) to deter the FCC's execution of an unequivocal duty.[21]

The Eighth Circuit, however, correctly held that the impossibility exception to section 152(b) has no relevance to this case because the Telecommunications Act did not assign the FCC a duty to set local prices. (Pet. App. 21a). Because Congress expressly stated in sections 252(c)(2) and 252(d) that the states are to determine the rates for local telecommunications services, the Court held the FCC had no valid authority that was being threatened by the states. *Id.* Thus, the Eighth Circuit properly concluded the FCC had failed to demonstrate that the states' authority to establish rates in connection with the local competition provisions of the Act would render impossible the FCC's execution of any duty regarding interstate communications or impede any of its interstate regulatory goals. *See California v. FCC*, 75 F.3d 1350, 1359 (9th Cir.) *cert. denied*, 116 S. Ct. 1841 (1996).

The Eighth Circuit also pointed out that the cases decided by other circuits applying the impossibility exception did not have the assistance of a federal statute that specifically

---

[21] In considering the impossibility argument and distinguishing these cases, the Eighth Circuit explained that telecommunication ratemaking has traditionally been capable of being separated into its interstate and intrastate components. (Pet. App. 20a). *Id.*

determined who had jurisdiction over the telecommunications area at issue. (Pet. App. 21a-22a). Those courts had to resort to analyzing the interstate/intrastate character of the telecommunications services. The Eighth Circuit's analysis was primarily based on basic statutory construction, not on an analysis of the interstate/intrastate character of the services. Nevertheless, there certainly is no conflict, because even applying this analysis, no preemption is necessary.[22]

CONCLUSION

This Court has previously reviewed each and every jurisdictional argument advanced by the petitioners, either in rejecting their requests to vacate the Eighth Circuit's stay or in *Louisiana*. No new grounds have been raised in these petitions. The petitions for a writ of certiorari should be denied.

Respectfully submitted,

---

[22] The Eighth Circuit followed up its construction of the statute with a finding that the functions of interconnection, unbundled access, resale, and transport and termination of traffic are fundamentally intrastate in character and the states' regulation of the rates for these services will not negate the FCC's traditional jurisdiction over interstate communications. (Pet. App. 22a).

61 pp

This Brief in Opposition is filed on behalf of the following GTE Entities as respondents:

GTE Service Corporation
GTE Alaska Incorporated
GTE Arkansas Incorporated
GTE California Incorporated
GTE Florida Incorporated
GTE Midwest Incorporated
GTE South Incorporated
GTE Southwest Incorporated
GTE North Incorporated
GTE Northwest Incorporated
GTE Hawaiian Telephone Company Incorporated
GTE West Coast Incorporated
Contel of Minnesota, Inc.
Contel of the South, Inc.

QUESTIONS PRESENTED

1. Did the Court of Appeals err in concluding that the plain terms of the Telecommunications Act of 1996 leave pricing determinations under the local competition provisions of the Act to state public utility commissions, rather than the FCC?

2. Did the Court of Appeals err by interpreting 47 U.S.C. § 251(c)(3), which requires incumbent telephone companies to provide network elements to requesting carriers "in a manner that allows requesting carriers to combine such elements," as requiring requesting carriers, rather than incumbents, to undertake the burden of combining elements in order to provide telephone service?

3. Did the Court of Appeals err in vacating the FCC's rule implementing 47 U.S.C. § 252(i), which provides that an incumbent telephone company must "make available any interconnection, service, or network element provided under an agreement . . . to which it is a party to any other requesting telecommunications carrier upon the same terms and conditions as those provided in the agreement," where the FCC's rule would have allowed requesting carriers to pick and choose individual terms from other agreements without accepting all of the trade-offs that had produced those terms?

RULE 29.6 STATEMENT

Pursuant to Supreme Court Rule 29.6, the GTE Entities advise the Court that each of the GTE Entities listed inside the front cover of this brief is a subsidiary of GTE Corporation. In addition, GTE Corporation has the following subsidiaries or affiliates that have outstanding securities in the hands of the public:

BC TELECOM, Inc.
BBN Corporation
Cable-Axion Digitel Inc.
Cable-Axion Quebec Inc.
Caribbean Reservation Center, C. por A.
Communications Telefonicas, C. por A.
Conagro Telecommunications, S.A.
CTI Compania de Telefonos del Interior S.A.
CTI North Compania de Telefonos del Interior S.A.
Digital Courier International Inc.
GTE California Incorporated
GTE Directories Corporation Ltd.

H.R. Rep. No. 204, 104th Cong., 1st Sess. 7

Joint Explanatory Statement of the Committee
of the Conference,
H.R. Conf. Rep. No. 458, 104th Cong.,
2d Sess. 113 (1996) 3

Reed Hundt, Chairman, FCC,
remarks to the Chamber of Commerce,
Washington, D.C. (May 29, 1997) 24

STATEMENT

In their petitions, the FCC and the long-distance companies attempt to paint the States as guardians of monopolies designed to deprive American consumers of the benefits of affordable telephone service. That claim is a gross distortion, and correcting it makes it even clearer why, as the Eighth Circuit held, Congress expressly assigned jurisdiction over the pricing provisions of the Telecommunications Act of 1996 to the States, not the FCC.

A. Regulation Prior to the Telecommunications Act of 1996.

For decades prior to the passage of the Telecommunications Act of 1996, the provision of local telephone service was regulated by the States as a natural monopoly. The capital investment required to build a telephone network connecting every home and business in a given area was so vast that it made sense economically for only one company to construct and operate such a local exchange network. As a result, state public utility commissions regulated local telephone companies ("local exchange carriers" or "LECs") through a system of exclusive franchises.

Through the prior exclusive franchise system, the States and the LECs built and extended to all Americans the finest local telecommunications network in the world at affordable rates. The provision of basic service to all who desire it at affordable rates is known as "universal service." The exclusive franchise system was key to the success of universal service in two ways. First, it enabled the States to encourage LECs to make the enormous investment needed to construct and upgrade first-rate networks and to extend them to all Americans, however remote their location. Second, it was the central pillar of an elaborate system of intercustomer subsidies that has kept rates for basic residential service extremely low.

For example, under the rates typically approved by State utility commissions, most everyday residential customers pay well below the full cost of providing them with basic service, and business customers pay well in excess of cost. Thus, among other intercustomer subsidies, businesses subsidize the local residential telephone service of most American citizens.

This background is relevant because now that local telephone service has been opened up to plenary competition, this subsidy system (and the low-cost residential universal service that it guarantees) is not sustainable in its current form. If new entrants are allowed to "cherry pick" high-revenue, low-cost business customers without paying their fair share of the costs of subsidizing low-cost service to all residents who desire it, the subsidy system, and the affordable universal service that it supports, will collapse. Congress knew this, and therefore (as we explain below), in the Telecommunications Act of 1996 placed the power to establish just and reasonable prices for services and facilities that a competitor purchases from the incumbent LEC in the hands of the State public utility commissions, who not only have traditionally regulated in this area, and thus have expertise in determining individual LECs' costs, but who also are in a much better position to ensure that competition is introduced in a manner that will preserve, not destroy, universal service.

B. Introduction of Competition By the States and The Telecommunications Act of 1996.

To read the petitions of the FCC and the long-distance companies, one would think that Congress, in the 1996 Act, dragged the States into the new world of competition. That impression is false.

The reality is that many States were well ahead of Congress in opening the markets for local telephone service to competition. By the early 1990s, advancing technology (particularly advances in wireless communication and the

pervasive presence of cable television wiring in almost every home in many areas) had made the possibility of competition in local telephony a reality. Acting on these advances, many States began in the early 1990s, before Congress, to open up the markets for local telephone service to competition.[1] In the 1996 Act, Congress essentially codified at the national level the trend that was already well underway in the States -- rejecting the view that local service continued to be a natural monopoly.

Indeed, the 1996 Act provides what Congress characterized as a "pro-competitive, *de-regulatory*" framework for opening to competition both the local and long-distance markets for telephone service. Joint Explanatory Statement of the Committee of the Conference, H.R. Conf. Rep. No. 458, 104th Cong., 2d Sess. 113 (1996) (emphasis added). With respect to local telephone service, the Act seeks to promote a rapid transition to competition in part by imposing three duties on incumbent LECs. First, the Act requires an incumbent LEC to allow other carriers to interconnect with its network so that the new entrants can connect calls from their own customers to customers served by the incumbent LEC's network. *See* § 251(c)(2). Second, the Act requires an incumbent LEC to offer for resale at wholesale rates any telecommunications service that the LEC provides to retail customers. *See* § 251(c)(4). Third, the Act requires an incumbent LEC to allow competitors to purchase on an "unbundled basis" individual pieces, or "elements," of the LEC's network (such as the switch or the wire to a customer's house), so that the new entrants may "combine such elements in order to provide . . . telecommunications service." *See* § 251(c)(3).

To implement these provisions while at the same time preserving the Act's stated goal of "reduc[ing] regulation,"

---

[1] *See, e.g.*, Notice of Proposed Rulemaking, CC Docket No. 96-98, 61 Fed. Reg. 18311, 18314 (Apr. 25, 1996) (noting that by 1996, nineteen States had already begun to open local service to competition).

Pub. L. No. 104-104 Preamble (1996), Congress crafted a system that relied on private negotiations between incumbent LECs and other carriers, backed up by binding arbitrations conducted by state public utility commissions. Thus, an incumbent LEC has a duty under the Act to "negotiate in good faith" to reach agreements allowing competitors to use its network, *see* § 251(c)(1), and agreements reached by such private negotiations are explicitly freed from many of the specific requirements of the Act, *see* § 252(a). If the parties fail to reach a private agreement, the Act calls upon state utility commissions to resolve open issues in binding arbitrations. *See* § 252(b).

In particular, the Act expressly assigns the States the role of determining, in arbitrations, the prices for interconnection, network elements, and wholesale services. Thus, the Act provides that in arbitrations, "a *State commission* shall . . . establish any *rates* for interconnection, services, or network elements *according to subsection (d)*" of section 252. § 252(c)(2) (emphasis added). Section 252(d), which is entitled "PRICING STANDARDS," then spells out the standards state commissions must follow in establishing those rates. With respect to interconnection and network elements, section 252(d)(1) provides that "[d]eterminations by a *State commission* of the just and reasonable rate . . . shall be . . . based on the cost . . . of providing the interconnection or network element . . . and . . . may include a reasonable profit." § 252(d)(1) (emphasis added). With respect to services, section 252(d)(3) provides that "*a State commission* shall determine wholesale rates on the basis of retail rates . . . excluding the portion thereof attributable to any . . . costs that will be avoided by the local exchange carrier" by selling at wholesale rather than retail. § 252(d)(3) (emphasis added).

The Act also gives some role to the FCC in implementing local competition, albeit not jurisdiction over prices. For example, § 251(e) authorizes the FCC to designate an entity "to

administer telecommunications numbering and to make such numbers available on an equitable basis." *See also* § 251(b)(2) (giving the FCC a role in defining duties to implement number portability); § 251(b)(4) (access to rights of way).

To ensure that the Act would be implemented swiftly, Congress imposed strict deadlines on the state commissions and the FCC. With respect to the state commissions, section 252(b) requires a state commission to conclude arbitrations "not later than 9 months after" a competing carrier first requests interconnection, network elements or services. § 252(b)(4)(c). With respect to the FCC, § 251(d) directed the FCC to complete all necessary actions to issue regulations implementing its tasks under section 251 "[w]ithin 6 months after the date of enactment" of the Act. § 251(d)(1).

C. The FCC's First Report and Order.

The process established by Congress for introducing local competition got underway immediately after passage of the Act in February 1996. Private negotiations started promptly and, under timetables set in the Act, state commissions soon began arbitrating agreements. In short, as the Court of Appeals later explained in entering a stay of the FCC's pricing rules, "[t]he Act's system of private negotiation backed by state-run arbitration was operating without the input from the FCC" to speed the transition to competition and had "initially proved to be successful." *Iowa Utilities Board v. FCC*, 109 F.3d 418, 427-28 (8th Cir. 1996).

On August 8, 1996, however, the FCC announced its First Report and Order[2] and threatened to derail that process entirely. While purporting to implement the *de-regulatory* mandates of the Act, the FCC instead produced a mammoth 700-page Report and Order that replaced the process Congress

---

[2] In the Matter of Implementation of the Local Competition Provisions in the Telecommunications Act of 1996, CC Docket No. 96-98 (Aug. 8, 1996).

envisioned for fostering competition -- a system of private negotiations backed by localized state arbitrations -- with an exhaustive national code purporting to dictate virtually every aspect of the terms the States were to impose in arbitrations.

In particular, the FCC set specific so-called "proxy prices" to be used in the ongoing arbitrations. The FCC declared that the States *must* use these proxy prices unless they first completed cost studies based on a pricing methodology described for the first time in the FCC's order. *See* First Report and Order ¶ 619 (App. 1a).

In addition, the FCC claimed plenary authority to dictate to the States exactly what costs they could and could not consider in setting rates. *First*, the First Report and Order prohibited States from even considering the actual historical costs of constructing an incumbent LEC's network. Instead, the FCC commanded that all States must set prices based only on forward-looking costs -- specifically on what the FCC termed total element long-run incremental cost ("TELRIC"). *See* First Report and Order ¶¶ 705-06 (Pet. App. 250a-252a). *Second*, the FCC even prohibited States from considering a LEC's own forward-looking costs -- *i.e.*, the prospective costs an incumbent LEC would actually incur in operating its own network. Instead, the FCC purported to require all States to set prices based on a nonexistent *hypothetical network* that used only the most efficient technology available. *See id.* ¶ 685 (App. 8a). *Third*, even as to the FCC's hypothetical forward-looking costs, the First Report and Order sharply limited the joint and common costs that a LEC could recover, *see id.* ¶ 696 (App. 8a-9a), effectively ensuring that a LEC would not be able to recover most of its joint and common costs.

The FCC also promulgated a series of rules radically expanding the unbundling obligation imposed by the Act. The FCC concluded that a new entrant could provide service solely through the purchase of all the elements of an incumbent's network. *See* First Report and Order ¶¶ 328-334 (Pet. App.

242a-246a). At the same time, the agency ruled that an entrant could obtain these elements already pre-assembled into a finished package of local service -- the entrant would not have to do any "combining" of elements whatsoever. *See* 47 C.F.R. § 51.315(b), (c) (Pet. App. 294a).

This so-called "sham unbundling" rule (together with the hypothetical TELRIC pricing rules) threatened to undermine the system of universal service that Congress was so careful to preserve during the transition to competition. In setting the statutory standard for the price of wholesale services, Congress was careful to require new entrants to contribute towards the subsidization of residential universal service by requiring State commissions to set wholesale prices at the LEC's retail rates (which, for high-revenue customers, include a margin that contributes to universal service) minus only those costs that the LEC will avoid by selling at retail instead of wholesale.[3] By allowing competitors to purchase all of the network elements necessary to provide local service already combined into the local service and not unbundled, the FCC effectively gave behemoth companies like AT&T and MCI a blueprint for undermining universal service and pocketing for themselves, through simple regulatory arbitrage, the very subsidies that keep residential service affordable. Either the competitor could call its purchase a purchase of local *service* -- in which case it would be required to contribute toward the subsidization of universal service through the LEC's wholesale rates -- or it could *relabel* that same purchase as one for all of the incumbents' network elements already combined together -- in which case the competitor could purchase the same service for

---

[3] Indeed, Congress explicitly recognized that such a pricing standard was necessary to protect existing subsidies in the LEC's rates. *See, e.g.*, H.R. Rep. No. 204, 104th Cong., 1st Sess., pt. 1, at 72 ("The [resale] rate should reflect whether, and to what extent, the local dialtone service is subsidized by other services . . . .").

a fraction of the wholesale cost of the service[4] and avoid making any contribution to universal service.[5]

D. Review in the Eighth Circuit.

Numerous parties filed petitions for review of the FCC's First Report and Order and the cases were consolidated in the United States Court of Appeals for the Eighth Circuit. The States of Iowa, Florida, Louisiana, and South Dakota, as well as GTE and other telephone companies, immediately sought a stay, at a minimum, of the FCC's pricing rules. After convening a special oral argument, the Court of Appeals stayed the FCC's pricing rules and expressly found that the States and other movants were likely to prevail on their claim that under the plain terms of the Act the FCC lacked jurisdiction to promulgate rules implementing the pricing terms of the Act. *See Iowa Utilities Board v. FCC*, 109 F.3d 418, 423-25 (8th Cir. 1996). The Court also found that the FCC's pricing rules would cause both the parties seeking the stay and the process set up by Congress for implementing the Act immediate and irreparable harm. *Id.* at 425-26.

At the merits stage, the parties re-briefed the issues of statutory construction that had been raised on the motions for

---

[4] AT&T's president touted to analysts that buying elements provides "another way to resell" service, but at a discount of "52 percent," as opposed to the statutory resale discounts which have been set in the range of 15-25 percent. *See* Transcript, "AT&T Investment Community Meeting" (March 3, 1997).

[5] While section 254(f) of the Act plainly commands that "every telecommunications carrier that provides intrastate telecommunications services *shall contribute*, on an equitable and nondiscriminatory basis . . . to the preservation and advancement of universal service," 47 U.S.C. § 254(f), the FCC made it clear that under its plan for implementing the pricing terms of the Act, in the critical period of transition to competition, new entrants would be allowed to purchase network elements at prices that failed to reflect universal service costs long *before* States had established new mechanisms for spreading the burden of universal service.

stay, and addressed additional issues as well. After considering several hundred pages of briefs and hearing three hours of oral argument, the Eighth Circuit adhered to its initial conclusion that the plain terms of the Act denied the FCC any authority over implementing the pricing provisions of the Act. The Court also vacated several further provisions of the FCC's rules. Three of the Court's decisions are most relevant to the questions raised in the petitions for *certiorari*.

First, applying standard principles of construction, the Court turned to the text of the Act to determine whether Congress had given the FCC authority to promulgate rules concerning the pricing terms for the local competition provisions. The Court found that section 252(c)(2) expressly directs state commissions, not the FCC, to establish rates in arbitrations conducted between new entrants and incumbents. Moreover, section 252(d) spells out the standards the state commissions are to apply. Examining the Act as a whole, the court concluded that "the Act plainly grants the state commissions, not the FCC, the authority to determine the rates involved in the implementation of the local competition provisions of the Act." Pet. App. 14a.

Alternatively, the Court explained that *even if* the text of section 252 were not clear, any ambiguity was resolved by section 2(b) of the Communications Act, which provides that "nothing in this chapter shall be construed to apply or to give the [FCC] jurisdiction with respect to . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communications service." 47 U.S.C. § 152(b). The Court noted that the rates incumbents could charge for opening their networks to competing providers of local exchange service were charges "for or in connection with intrastate communications service" and reasoned that under settled law, the restriction of section 2(b) barring the FCC from authority over such matters could only be overcome by a straightforward and unambiguous command

from Congress. *See* Pet. App. 15a-19a (citing *Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355 (1986)). But far from providing any unambiguous grant of authority to the FCC, the 1996 Act straightforwardly assigned the task of implementing the pricing standards of the Act to the States. The rule of section 2(b) thus confirmed the Court's construction of the plain terms of section 252.

Second, the Court addressed the scope of incumbent LECs' unbundling duties under the Act. GTE and other incumbents had argued that new entrants should not be permitted to provide local service wholly through the use of unbundled elements. Given that the FCC and most States had interpreted the pricing standards for unbundled elements and for services in a way that excluded historical, subsidy and other relevant costs, and thus made it substantially cheaper to buy all the elements of the network from end to end rather than to buy services at wholesale, GTE argued that it made no sense to allow entrants effectively to obtain the incumbent's own service for resale through the fiction of labeling their purchase as one of unbundled elements.

Rejecting the full scope of GTE's position, the Eighth Circuit ruled that entrants could provide service solely by purchasing all network elements. In other words, they could buy the entire network from end to end as elements and provide service solely over the incumbent's facilities. The Court emphasized, however, that it was critical to its analysis that under the terms of section 251(c)(3), new entrants would have to shoulder the burden of combining elements themselves. As the Court explained, the costs and risks that new entrants would have to bear in combining elements would ensure that the purchase of network elements and the purchase of finished service would remain separate methods of entry. The Court thus vacated a series of FCC rules requiring incumbent LECs to undertake the task of combining elements at new entrants' request. In its initial opinion, however, the Court without

comment left in place one rule, 47 C.F.R. § 51.315(b), that required incumbent LECs to provide entrants with elements already pre-assembled into a fully functioning package if the elements were already connected in the LEC's own network.

In a petition for rehearing, GTE and other parties pointed out that the failure to vacate this rule would fatally undermine the Court's rationale for allowing entrants to purchase all the network elements required to provide finished service. If an entrant could purchase elements already pre-assembled, it would face none of the additional costs and risks that the Court had identified and would, in effect, simply be obtaining finished service for resale, but at a lower price that undermined the system of universal service. The Eighth Circuit agreed and specifically vacated section 51.315(b). The Court explained that its ruling was critical for preserving a coherent reading of the Act, for to "permit such an acquisition of already combined elements at cost based rates for unbundled access would obliterate the careful distinctions Congress has drawn in subsections 251(c)(3) and (4) between access to unbundled network elements on the one hand and the purchase at wholesale rates of an incumbent's telecommunications retail services for resale on the other." Pet. App. 71a.

Third, the Court vacated the FCC's rule purporting to implement section 252(i). Under that section, incumbents must "make available any interconnection, service, or network element provided under an agreement . . . to which it is a party to any other requesting telecommunications carrier upon the same terms and conditions as those provided in the agreement." The FCC concluded that under this provision an entrant could pluck out from any other agreement solely the terms that applied to a single service or network element without having to accept any other provisions of the agreement -- even if terms on another matter had been the critical *quid pro quo* that made the favorable term selected by the entrant possible. The Court of Appeals recognized that this construction would render

unworkable the process of private negotiations that Congress had outlined as the primary means of implementing the Act. Incumbents could not realistically engage in a free give-and-take in bargaining if new entrants would always remain free to jettison selected portions of their agreements and to pick and choose the most favorable terms obtained by other carriers as replacements. The Court thus vacated the FCC's "pick and choose" rule as an unreasonable construction of the Act.

REASONS FOR DENYING THE WRIT

SUMMARY

None of the three separate issues raised by the petitions for certiorari warrants review by this Court.

1. The Eighth Circuit's ruling that the FCC lacks jurisdiction to impose pricing rules on the States does not merit review in this Court for several reasons.

First, the petitions for review largely ignore the actual holding below -- which rested on the 1996 Act's *express* assignment of pricing authority to the States. Only by ignoring this holding, which involves only a straightforward application of settled principles of statutory construction, can petitioners attempt to suggest that this case raises more far-reaching issues concerning the jurisdiction of the FCC. In addition, as explained below, the holding below is plainly correct.

Second, petitioners' attempt to concoct a circuit split out of the Court of Appeals' alternative reasoning based on section 2(b) of the Communications Act fails for at least three separate reasons. First, the theory on which petitioners rely in this Court -- that, despite section 2(b), the FCC has jurisdiction because the local telephone network is used inseverably for both intrastate and interstate communications -- was *not* the basis upon which the agency asserted jurisdiction in the First Report and Order. Under settled principles of administrative law, that rationale cannot now provide a basis for second-guessing the Court of Appeals. Second, the Court of Appeals

explicitly held that, because the 1996 Act expressly assigned jurisdiction to the States, it was not necessary to rest its decision on whether the services in question were intrastate or interstate in nature and on how that might affect the application of section 2(b). Third, the Eighth Circuit's decision cannot possibly conflict with the decisions of other circuits interpreting section 2(b) for the additional reason that none of the cases cited by petitioners involved an express statutory assignment of jurisdiction to the States.

Third, while important at the time (because it stayed the FCC's arbitrary proxy prices), the Eighth Circuit's jurisdictional decision has had no real impact on the substantive pricing rules that have been imposed on LECs, because, as FCC Commissioners have repeatedly proclaimed, virtually every State has adopted a substantive pricing approach similar to that adopted by the FCC. Revisiting and reversing the Eighth Circuit's jurisdictional holding would only lead to delays from further rounds of litigation and, by the FCC's own admission, could accomplish little substantive change in the pricing approach the States have applied.

2. Nor is it appropriate to grant certiorari to review the Court of Appeals' decision that incumbent LECs cannot be required to provide competitors with unbundled network elements already preassembled into finished telephone service.

First, the Eighth Circuit's decision on this issue is plainly correct. It would be contrary to the plain language of the statute, and would undermine the entire structure of the Act, if a competitor were allowed to evade the wholesale pricing standards established by Congress merely by *relabeling* its purchase of local service as the purchase of all the network elements necessary to provide that service already preassembled into a finished package. Congress did not intend to allow an entrant to purchase local service at roughly half the cost of wholesale service and to avoid its obligation to contribute toward the provision of universal service merely by

relabeling its purchase of service as the purchase of all the elements of a LEC's network already bundled together.

Second, granting certiorari on this question would require the Court also to delve into at least two additional questions that are inextricably intertwined with the issue on which petitioners' seek review and that the Court of Appeals decided *in petitioners' favor*. Specifically, the questions of (i) what parts of a LEC's business constitute "network elements," and (ii) whether a competitor can purchase *all* of the elements necessary to provide finished telephone service, are inextricably linked with the Court of Appeals' decision that a LEC, while required to provide a competitor with all network elements, need not provide them already preassembled into finished telephone service. It would be unfair, and would result in an incoherent interpretation of the 1996 Act, for the Court to attempt to address the Court of Appeals' invalidation of section 51.315(b) of the First Report and Order without also addressing these other issues. The Court simply cannot wade halfway into the complex telecommunications issues presented by this case. While we believe that the Court should not reopen any of these issues that consumed hundreds of pages of briefing below, we intend to file promptly a conditional cross-petition raising those issues that are intertwined with the nonjurisdictional unbundling issues raised by the petitions.

3. Finally, the Court of Appeals' decision invalidating the FCC's "pick and choose" interpretation of section 252(i) of the Act is plainly correct and involves only the most fact-bound application of settled rules of statutory construction. It is in no event worthy of review by this Court.

I. The Eighth Circuit's Ruling that the FCC Lacks Jurisdiction To Impose Its Pricing Theories on the States Was Plainly Correct And in Any Event Involves Only Settled Principles of Statutory Construction.

A. The Eighth Circuit Correctly Determined That the Plain Terms of the Act Assign the States the Task of Implementing the Pricing Terms of the Act.

The petitions for certiorari largely ignore the actual holding below, which rested on the express assignment of pricing authority to the States in section 252. Instead, they focus their attacks on the Court's alternative analysis under section 2(b). That tactic is hardly surprising, for a review of the terms of section 252 readily demonstrates that Congress straightforwardly assigned authority over pricing to the States, and that nothing in the ruling below merits this Court's review.

As the Eighth Circuit explained, section 252(c) commands the "State commission[s]" to "establish any rates for interconnection, services, or network elements," and it requires them to follow only the standards outlined in subsection 252(d).[6] Section 252(d), a section entitled "Pricing Standards," provides the specific substantive standards the States are to apply, "thus negating the need for additional FCC-mandated ratemaking standards or guidelines." Pet. App. 14a.[7]

---

[6] Congress addressed any concerns that might be raised under the Tenth Amendment by ensuring that States could opt out of their role under the Act. *See* 47 U.S.C. § 252(e)(5).

[7] Contrary to the claims of petitioner MCI, the decision below raises no constitutional concern that federal lawmaking authority has been delegated to the States. MCI attempts to manufacture such a problem by grossly misquoting the opinion to suggest that state commissions would be "'dictat[ing] the substantive standards'" under the Act. *See* MCI Pet. at 26. The passage cited actually states simply that Congress had *not* intended *the FCC* to be "in a position to dictate the substantive standards governing the

(continued...)

The absence of any role for the FCC in pricing is confirmed by the structure of section 252(c). In defining States' obligations for conducting arbitrations, that section creates a clear dichotomy. Section 252(c)(1) makes it plain that in imposing terms on subjects over which the FCC has some rulemaking authority under section 251, States must ensure that those terms meet *both* "the requirements of section 251" *and* "the regulations prescribed by the Commission pursuant to section 251." In sharp contrast, in the very next paragraph, the Act addresses the States' role in setting prices as a separate matter and -- omitting any reference to FCC rules -- commands solely that "a state commission shall . . . establish rates for interconnection, services, or network elements according to subsection [252](d)." As the Court of Appeals explained in entering its stay of the FCC's pricing rules, the contrast between section 252(c)(1) and section 252(c)(2) makes it plain that "where Congress intended for the state commissions to follow FCC rules in arbitrations, it expressly said so." 109 F.3d at 424.

In short, the Eighth Circuit was correct in concluding that "the absence of any reference whatsoever to the FCC in the sections of the Act that directly authorize the state commissions to establish prices confirms to us that Congress did not envision the FCC's participation in determining prices." Pet. App. 13a.

The Eighth Circuit also rightly concluded that *even if* there were some ambiguity in the terms of section 252, section 2(b)

---

[7] (...continued)
[rural] exemption process." Pet. App. 30a. A restriction on the FCC in implementing the rural exemption provisions of the Act in no way suggests that States have been granted federal lawmaking authority, and it certainly has no bearing on the States' role under the provisions MCI purported to be addressing -- the pricing provisions. Relying on state agencies to apply the pricing standards spelled out in the Act through quasi-adjudicative arbitrations raises no constitutional concerns whatsoever.

of the Communications Act would preclude FCC jurisdiction over pricing. Section 2(b) provides that "nothing in this chapter shall be construed to apply or to give the [FCC] jurisdiction with respect to . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communications service." 47 U.S.C. § 152(b). As this Court has pointed out, section 2(b) is a "congressional denial of power to the FCC" that "fences off" intrastate matters from FCC control. *Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355, 370, 374 (1986). This restriction on the FCC can be overcome only if Congress includes "unambiguous" and "straightforward" language in the Act either modifying section 2(b) or expressly granting the FCC additional authority. *Id.* at 377. Here, the provisions of the Act allowing new entrants access to incumbents' networks so that they may provide competing local telephone service clearly address predominantly intrastate matters. Yet the FCC cannot point to either exception to section 2(b). There is no "unambiguous" grant of authority to the FCC over pricing, nor did Congress amend section 2(b) to exempt the local competition provisions from its operation.

The FCC's strained attempts to find unambiguous language supplying its claimed authority over pricing are of no avail. The FCC first points to section 251(d)(1), which provides only that the FCC must promulgate any regulations implementing section 251 within 6 months of the date of enactment. But even the FCC tacitly acknowledges that section 251(d) provides no clear grant of rulemaking authority over pricing as it equivocates between calling the section a "grant" and a "confirmation" of authority. *See* FCC Pet. at 12. Such a provision that appears to *assume* an unspecified measure of rulemaking authority conferred upon the FCC elsewhere can hardly override the express delegation to the States of authority over *pricing* in section 252(d). Indeed, the section cannot possibly grant authority over pricing, for to the extent it implies any authority at all, it refers only to rules to

"implement the requirements of *this section*."[8] (Emphasis added). But it is plainly section 252, not section 251, that provides the pricing standards under the Act. The FCC can only pretend that section 251 "prescribes a set of new federal standards to govern . . . the prices that incumbent[s] . . . may charge competitors," FCC Pet. at 11, by studiously ignoring the section that by its terms actually addresses "Pricing Standards" -- that is, section 252(d).

Nor can the FCC or its supporters rely on the fact that section 251(c)(3), in defining the duty to provide unbundled elements, requires that elements be provided on "rates, terms, and conditions that are just [and] reasonable," to claim that the FCC must have authority to implement the "rate provisions of Section 251(c)." FCC Pet. at 15. The mere reference to "just and reasonable" rates in section 251(c) cannot provide the FCC the authority it purported to exercise in issuing its exhaustive pricing regulations. To the contrary, in outlining its forward-looking cost methodology, the FCC explicitly sought to implement the cost-based pricing standard that *State commissions* were directed to apply under section 252(d). *See* First Report and Order ¶¶ 628, 630-633 (App. 2a-7a). Pointing now to section 251(c)'s "just and reasonable" language thus cannot possibly justify the FCC's rules.

Next, the FCC and other petitioners point to general grants of rulemaking authority elsewhere in the Communications Act of 1934. For example, the FCC relies on the last sentence of section 201(b). The Eighth Circuit rightly concluded, however, that this grant of authority is limited to interstate matters. Section 201(a) is expressly limited to "interstate or foreign communication by wire or radio," and section 201(b) begins by making it plain that it is addressing "such communication service" -- that is, the same interstate or foreign communication

---

[8] Similarly, section 252(c) refers to state commissions following FCC rules promulgated only under section 251. *See* § 252(c)(1).

addressed in section 201(a). The FCC's claim that the last sentence of the section is somehow freed from the same restriction blithely ignores everything that comes before. In any event, any grant of general rulemaking authority in the 1934 Act cannot override Congress's express assignment to the States of authority over the specific pricing terms of the local competition provisions of the 1996 Act. That result follows ineluctably from the long-settled canon of construction that specific terms trump the general. *See, e.g., Morales v. Trans World Airlines, Inc.*, 504 U.S. 374, 384-85 (1992).

At bottom, the FCC and its supporters rest their arguments on the assumption that it would be inconceivable that the federal Act could ever apply to a subject without simultaneously giving the FCC rulemaking authority. Nothing in the text of the Act, however, dictates that the FCC's authority must follow wherever Congress has applied federal law, especially where Congress has specifically assigned authority for implementing certain provisions of the Act to state commissions.[9]

B. The Eighth Circuit's Decision Does Not Create Any Circuit Conflict Concerning the Application of Section 2(b).

Petitioners next claim that the Eighth Circuit's decision creates a conflict among the circuits concerning the application of section 2(b). That assertion is false for at least three independent reasons.

---

[9] The question of authority over dialing parity rules that was addressed in the Eighth Circuit's ruling on the Second Report and Order does not raise any fundamentally different analysis. There too, the plain terms of the Act indicate State control, *see, e.g.*, 47 U.S.C. § 271(e)(2)(B) (indicating that States may issue orders requiring toll dialing parity), and in any event, the FCC can point to no unambiguous grant of authority to overcome section 2(b).

First, the so-called "inseverability" analysis on which the FCC now relies to support its claimed authority over pricing formed no part of the agency's rationale for its jurisdiction when it issued the First Report and Order. *See* First Report and Order ¶¶ 83-103, 111-120 (Pet. App. 190a-202a, 210a-215a). Under settled principles of administrative law, this new-found theory cannot serve as a basis for second-guessing the Court of Appeals' decision now. *See SEC v. Chenery Corp.*, 332 U.S. 194, 196 (1947). In any event, inseverability analysis could never justify the broad authority the FCC has claimed -- an authority that includes the power to set wholesale rates for wholly *intra*state local telephone service. There is no plausible basis for claiming that allowing the States authority to set such wholesale rates for local service would negate the FCC's ability to regulate *inter*state communications.

Second, and equally importantly, petitioners flatly misread the decision below. Petitioners claim that the Eighth Circuit rested its jurisdictional holding critically on the conclusion that section 2(b) denies the FCC authority because the local competition provisions address services that are "fundamentally intrastate" in nature. According to petitioners, that reasoning supposedly conflicts with the decisions holding that where equipment is used to provide both interstate and intrastate service, and the FCC cannot successfully regulate the interstate aspects of the equipment's use as a separate matter, the FCC may regulate *both* interstate and intrastate uses of the equipment. *See, e.g.*, FCC Pet. at 19. According to petitioners, other circuits would have recognized that the local exchange is used to provide both interstate and intrastate services and on that basis would have granted the FCC's claimed authority over all pricing under the Act.

The central flaw in petitioners' argument is that the Eighth Circuit did not, as petitioners suggest, rest its decision primarily on section 2(b). To the contrary, as outlined above, the Court relied on the plain terms of the Act, which "directly

and straightforwardly assig[n] to the States the authority to set the prices regarding the local competition provisions of the Act." Pet. App. 17a. The Court went on to address section 2(b) only to demonstrate that *even if* the text of section 252 were not so clear, any ambiguity would still have to be resolved by assigning control over pricing to the States. Characterizing the services covered in the local competition provisions as intrastate or interstate thus formed no essential part of the Court's holding. Indeed, the Court even took pains to make it clear that "subsections 252(c)(2) and 252(d) clearly assign jurisdiction over the rates for the local competition provisions of the Act to the state commissions, *thus avoiding the need to analyze the interstate/intrastate character of these services*." Pet. App. 22a (emphasis added). The decision cannot create a circuit conflict concerning the application of the so-called "inseverability" exception to section 2(b) when the Court made it clear that the entire analysis under section 2(b) was only an alternative rationale for its result.

To the extent the Court below did point out that "*even* a traditional analysis of the interstate/intrastate quality of the local competition provisions of the Act reveals that these functions . . . are fundamentally intrastate in character," Pet. App. 22a (emphasis added), it was providing reasoning in the alternative that was not essential to its holding. Petitioners' attempt to seize upon this dicta as the critical basis for a purported circuit conflict, *see, e.g.*, FCC Pet. at 19; AT&T Pet. at 13, is nothing but an effort to manufacture an illusory dispute and cannot justify review by this Court.

Third, because the Act straightforwardly assigns the States the task of implementing the pricing provisions, this case is readily distinguishable from those in which inseverability analysis has been applied to extend FCC jurisdiction over intrastate matters. Indeed, the Eighth Circuit distinguished many of the very cases petitioners cite on precisely that basis. *See* Pet. App. 21a.

C. The Eighth Circuit's Ruling Implementing the Balance of Authority Specified By Congress in No Way Impedes the Implementation of the Act.

Petitioners finally attack the Eighth Circuit's decision on the grounds that, in their view, by depriving the FCC of absolute authority to dictate national pricing rules, it makes the implementation of the Act, and the advent of competition, impossible. In reality, however, it is further review of the FCC's jurisdictional claims that would lead to delay.

In part, petitioners suggest that uniformity is critical to the success of the Act. But throughout the petitions there is also an undercurrent suggesting something more sinister in allowing the States an independent role in applying the terms of the Act to local conditions. Petitioner MCI brazenly makes its mistrust explicit as it charges the States with "complicity . . . in past monopolistic local markets" and exclaims that, given their "complicity," "Congress kept state commissions on a short leash" in performing any role under the Act. MCI Pet. at 7.

Contrary to such wild claims, the terms of the Act make it plain that Congress intended the States to play a vital and independent role in implementing critical terms of the Act. While the FCC and its supporters see any variation in the application of the Act as a descent into chaos that must be stopped, the 104th Congress saw it as federalism. As this Court has often pointed out, decentralized decisionmaking is one of the most salutary aspects of our federalist system of government. *Cf. Gregory v. Ashcroft*, 501 U.S. 452, 458 (1991) (noting that the "federalist structure of joint sovereigns" "allows for more innovation and experimentation in government"). The 104th Congress that passed the Telecommunications Act was keenly aware of the benefits that can come from keeping power in the hands of the States and thus called upon the state commissions -- which have regulated local telephone service for decades -- to play a central role in implementing the Act by conducting the case-specific

arbitrations that would lead to interconnection agreements. The States, after all, were in the best position to implement the Act in a manner that would not undermine the mechanisms used in each locality for promoting universal service.

In large part, the FCC simply assumes that there must be an overriding concern for producing a single, uniform application of the terms of the Act nationwide. Thus, the FCC and its supporters complain that under the Eighth Circuit's decision, the district court review process provided by Congress may take years before a completely uniform interpretation of the pricing provisions of the Act is achieved. The answer to this claimed infirmity in the decision is simple: the federal agency's obsession with rigid uniformity in results appears nowhere in the text of the statute. To the contrary, the Act relies primarily on private negotiations to establish interconnection agreements and frees such negotiated agreements from many of the specific requirements of the Act. *See* § 252(a). That rule obviously permits the widest imaginable variation in results. In addition, after assigning individual state commissions the task of conducting arbitrations, Congress provided for the most decentralized system of review possible -- review in the 93 federal district courts. *See* § 252(e)(6). Nothing about that system reveals a congressional concern with rapidly establishing a single, rigidly uniform application of the Act. To the contrary, Congress gave the States a vital role in implementing the Act precisely so that state commissions could use their localized experience to apply the Act to the varying circumstances in each of the fifty States.

That process of applying the Act, moreover, has long been underway. And while the FCC claims that it wants to speed implementation of the Act, it is actually further review of the FCC's claims to jurisdiction that will disrupt the steady progress the States have made in moving towards competition under the Act. Since the Eighth Circuit stayed the FCC's

pricing rules over a year ago, state commissions have proceeded rapidly with localized, case-specific arbitrations and have produced final interconnection agreements allowing new entrants to use incumbents' facilities, just as Congress intended. And despite the FCC's claims last fall that only it, and not the States, could be trusted to impose proper prices under the Act, as events have unfolded, the FCC has recently proclaimed that in fact "virtually every state" has followed the general approach adopted by the FCC and has required pricing based on forward-looking measures of cost. *See, e.g.* Reed Hundt, Chairman, FCC, remarks to the Chamber of Commerce, Washington, D.C. (May 29, 1997) ("[V]irtually every state in the Union has adopted our policies.").

Given the FCC's own assertions about the success its pricing theories have enjoyed in the States, the dire claims presented to this Court concerning the implementation of the Act ring rather hollow. Indeed, it seems clear that what is at stake here is not a battle over a fundamentally different pricing theory that will make or break competition in local telephone service, but rather a turf battle over whether or not a federal agency can augment its power so as to dictate every nuance of the pricing decisions state regulators must make under the Act.

Even if the Court were to grant review and even if it were somehow to conclude that the Eighth Circuit erred in its rulings on the FCC's jurisdiction over pricing, that decision would hardly lead to any speedier implementation of the local competition provisions of the Act. To the contrary, it would only produce lengthy rounds of additional litigation.

To begin with, GTE and other parties argued below that the FCC's pricing rules were invalid not only because the FCC lacked jurisdiction, but also because the substantive pricing standards violated the terms specified by Congress. On remand the Eighth Circuit would have to revisit the question of the substantive validity of the FCC's pricing rules. And given that the Eighth Circuit already has squarely concluded that the

proxy prices the FCC developed based on its pricing theories were likely to cause incumbents irreparable harm, there is a substantial possibility that the Eighth Circuit will strike down the FCC's pricing rules on the merits. In that event, the FCC would have to re-work its pricing approach before there could be any question of its rules ultimately being implemented by state commissions across the country.

Moreover, even if a set of pricing rules from the FCC were eventually approved in court, that would not mean that such rules could instantly be implemented. Since the Eighth Circuit stayed the FCC's pricing rules over a year ago, the States have been conducting arbitrations under their own interpretations of the Act's pricing provisions. Most of those arbitrations have produced final agreements that are now before district courts under the review provisions specified by Congress. *See* § 252(e)(6). Changing the applicable pricing rules now would mean suspending all of those district court actions, turning the clock back to the fall of 1996, and returning the arbitrated agreements to the States so that state commissions could re-work their pricing decisions to conform precisely to the FCC's rules. There is no reason to expect that this would be a speedy process. While most States have adopted many of the same basic approaches favored by the FCC, local variations in the details are plentiful -- just as Congress intended in allowing state commissions to use their local experience to implement the basic pricing standards of the Act. Even a slight change in the method used for determining the costs that underlie the cost-based pricing mandated by section 252(d)(2) could mean requiring the preparation of entirely new cost models, a process that could take many months of work.

In short, for well over a year, since the Eighth Circuit first stayed the FCC's pricing rules, the States have been laboring to implement the local competition provisions of the Act and have proceeded far along the path of using their own localized expertise to apply the pricing standards specified in section

252(d). The FCC, moreover, has publicly declared that the most critical aspects of its own pricing theories have been adopted across the country by the States acting independently. If this Court were to grant review now, the progress the States have made would be suspended and implementation of the Act would only be delayed.

II. The Eighth Circuit's Holding that Incumbent LECs Cannot Be Required to Provide Unbundled Elements Already Preassembled Into Platforms Was Plainly Correct, and in Any Event Involves Only Settled Principles of Statutory Construction.

The Court of Appeals' ruling that entrants may not obtain network elements already preassembled into fully operational service platforms also does not merit review for at least two reasons.

First, the holding was simply a correct application of standard rules of construction. The holding implements the clear directive in section 251(c)(3) that incumbents must provide "unbundled network elements in a manner that allows *requesting carriers to combine such elements*." (emphasis added). As the Eighth Circuit explained, this "sentence unambiguously indicates that requesting carriers will combine the unbundled elements themselves" -- incumbent LECs, in other words, have no duty to accomplish the combining for new entrants. Pet. App. 53a.

The Eighth Circuit's ruling on this point, moreover, was critical for maintaining a coherent interpretation of the obligations imposed on incumbents by the Act. GTE and other petitioners had argued that new entrants should not be allowed to provide local service *solely* through the purchase of unbundled elements because it would create opportunities for rampant arbitrage. As outlined above, given the prevailing interpretation that the pricing standards for wholesale service and for network elements were different, allowing entrants to

obtain all the elements needed for local service would simply allow them to obtain effectively the same thing as wholesale service, but at a different, lower price. Moreover, it would allow entrants to obtain the incumbent's finished service while completely evading any contribution toward universal service.

The Eighth Circuit did not agree entirely with either side on this issue. The Court ruled that an entrant could provide service solely through purchasing unbundled network elements, but it emphasized that its ruling would *not* result in the arbitrage GTE and others had feared. It was critical to the Court's analysis that, even though an entrant could effectively provide the incumbent's own finished service by means of purchasing network elements, purchasing elements would not be a simple substitute for purchasing wholesale service because it would require the entrant to assume much higher costs and risks. In particular, purchasers of elements would have to bear the costs and risks associated with *combining* the elements themselves. As the Court explained, "our decision requiring the requesting carriers to combine the elements themselves increases the costs and risks associated with unbundled access as a method of entering the local telecommunications industry *and simultaneously makes resale a distinct and attractive option*." Pet. App. 56a-57a (emphasis added).

Allowing new entrants to obtain all of the network elements needed to provide service already combined together, however, "would obliterate the careful distinctions Congress has drawn in subsections 251(c)(3) and (4) between access to unbundled network elements on the one hand and the purchase at wholesale rates of an incumbent's telecommunications retail services for resale on the other." Order on Rehearing, Pet. App. 71a. As the Court recognized, obliterating that distinction would make no sense of the Act, and would simply allow the disastrous arbitrage that GTE and other LECs had feared.

Petitioners primarily argue that the Eighth Circuit misinterpreted the term "unbundled." All the ink petitioners

spill on the meaning of "unbundled" in other contexts, *see, e.g.*, FCC Pet. 26-27, AT&T Pet. 24-25, however, is entirely beside the point. Contrary to the picture petitioners would like to paint, the Court did not simply look at the term "unbundled" in isolation and produce the "unexplained assertion," AT&T Pet. at 23, that unbundled must mean "separated." Rather, the text of section 251(c)(3) makes it clear that Congress envisioned requesting carriers undertaking the burden of "combining" physically separated elements. Thus, whatever "unbundled" may mean in other contexts, read in the context of the sentence in which it appears in section 251(c)(3), it refers to pieces of the network that have been provided on a separated basis and which carriers can "combine." Moreover, as the Eighth Circuit explained, the burdens and risks associated with combining unbundled elements are essential for making sense of the overall structure of the Act since they preserve a vital distinction between purchasing unbundled elements and purchasing services for resale.

In short, the Eighth Circuit's ruling ensuring that incumbents will not be forced to provide new entrants with elements already pre-assembled into operational platforms not only implements the plain terms of section 251(c)(3) but is also necessary to preserve the distinction between network elements and resold service as separate methods of entry into the local market and to prevent new entrants from pocketing for themselves the very revenues that support universal service.

Second, as the above analysis suggests, the Eighth Circuit's decision to vacate the rule requiring incumbents to provide pre-assembled packages of elements was only one facet of its broader reading of the unbundling provisions of the Act. Thus, the Eighth Circuit ruled *in favor* of the FCC and other petitioners in determining both (i) that virtually all of the business functions of an incumbent LEC were network elements that must be provided to competitors and (ii) that an entrant could provide service *solely* through the purchase of an

incumbent's elements. As a result, if this Court were to reexamine the Eighth Circuit's ruling on the issue of pre-combined network element packages, it would necessarily require wading into a re-evaluation of the Court of Appeals' entire approach to understanding the unbundling duties required by the Act. To preserve its rights on these issues, GTE intends to file a conditional cross-petition for certiorari challenging both the Eighth Circuit's decision affirming the scope of the FCC's unbundling rules and its conclusion that new entrants can be allowed to provide local service solely through the use of unbundled network elements.

III. The Eighth Circuit's Decision to Vacate the "Pick and Choose" Rule Correctly Implements the Terms of the Act and Does Not Merit Review in this Court.

Petitioners' final claim is that the Eighth Circuit erred in striking down the FCC's rule purporting to implement section 252(i). That section provides that a "local exchange carrier shall make available any interconnection, service, or network element provided under an agreement . . . to which it is a party to any other requesting telecommunications carrier upon the same terms and conditions as those provided in the agreement." 47 U.S.C. § 252(i). The FCC ruled that under this section requesting carriers could "pick and choose" among individual provisions of interconnection agreements, selecting only the terms that seemed favorable to them and leaving others behind.

The Eighth Circuit rightly concluded that such an interpretation would undermine the process Congress outlined for implementing the Act and thus was not a reasonable reading of the text. Negotiating an interconnection agreement necessarily involves a process in which each party may make a concession on a particular point in return for a concession from the other party -- often on an unrelated part of the agreement. That bargaining process would be derailed, however, if after accepting one set of trade-offs in an agreement every new entrant would remain free to abandon

some terms of its deal and to pick out individual terms some other carrier had obtained -- terms unrelated to the particular bargains that had been struck in that entrant's own negotiations. In essence, agreements reached by negotiation would never actually be binding since a new entrant would always be free to jettison the trade-offs it had accepted and to cherry-pick favorable provisions found elsewhere. The Eighth Circuit was thus entirely correct in concluding that the FCC's construction was not a reasonable reading of the Act.

Petitioners claim that the Eighth Circuit misapplied the rule of *Chevron* by substituting its construction of an ambiguous provision for the FCC's. *See, e.g.*, AT&T Pet. at 29. That claim, however, mischaracterizes the Eighth Circuit's analysis. The Court fully acknowledged that "the language of subsection 252(i) in isolation does not clearly reveal Congress's intent," and, following *Chevron* precisely, explained that "we 'must look to the structure and language of the statute as a whole' to determine if the FCC's interpretation of this ambiguous provision is a reasonable one." Pet. App. 25a (quoting *National R.R. Passenger Corp. v. Boston & Maine Corp.*, 503 U.S. 407, 417 (1992)). The Eighth Circuit reasonably concluded that given the emphasis in the Act on establishing a system of private negotiations, the FCC's expansive reading of section 252(i) would undermine the very process Congress had intended to be the primary means for implementing the local competition provisions of the Act.

In any event, even if the Eighth Circuit had erred in applying *Chevron* analysis, the fact-bound application of such a well-settled rule of law to the construction of a single section of a statute cannot justify review in this Court.

CONCLUSION

For the foregoing reasons, the petitions for certiorari should be denied.

APPENDIX

EXCERPTS FROM *IN THE MATTER OF IMPLEMENTATION OF THE LOCAL COMPETITION PROVISIONS IN THE TELECOMMUNICATIONS ACT OF 1996*, FIRST REPORT AND ORDER, CC DOCKET NO. 96-98 (AUG. 8, 1996)

¶¶ 619, 628, 630-633, 685, 696

I. PRICING OF INTERCONNECTION AND UNBUNDLED ELEMENTS

A. Overview

[* * *]

619. While every state should, to the maximum extent feasible, immediately apply the pricing methodology for interconnection and unbundled elements that we set forth below, we recognize that not every state will have the resources to implement this pricing methodology immediately in the arbitrations that will need to be decided this fall. Therefore, so that competition is not impaired in the interim, we establish default proxies that a state commission shall use to resolve arbitrations in the period before it applies the pricing methodology. In most cases, these default proxies for unbundled elements and interconnection are ceilings, and states may select lower prices. In one instance, the default proxy we establish is a price range. Once a state sets prices according to an economic cost study conducted pursuant to the cost-based pricing methodology we outline, the defaults cease to apply. In setting a rate pursuant to the cost-based pricing methodology, and especially when setting a rate above a

default proxy ceiling or outside the default proxy range, the state must give full and fair effect to the economic costing methodology we set forth in this Order and must create a factual record, including the cost study, sufficient for purposes of review after notice and opportunity for the affected parties to participate.

[* * *]

B. Cost-Based Pricing Methodology

1. Application of the Statutory Pricing Standard

c. Discussion

628. Sections 251(c)(2) and (c)(3) impose an identical duty on incumbent LECs to provide interconnection and access to network elements "on rates, terms, and conditions that are just, reasonable, and nondiscriminatory."[1] In addition, both interconnection and unbundled network elements are made subject to the same pricing standard in section 252(d)(1). Based on the plain language of sections 251(c)(2), (c)(3), and section 252(d)(1), we conclude that Congress intended to apply the same pricing rules to interconnection and unbundled network elements. The pricing rules we adopt shall, therefore, apply to both.

[* * *]

2. Rate Levels

a. Pricing Based on Economic Costs

(1) Background

630. We observed in the NPRM that economists generally agree that prices based on forward-looking long-run incremental costs (LRIC) give appropriate signals to producers and consumers and ensure efficient entry and utilization of the

---

[1] 47 U.S.C. § 251(c)(2), (c)(3)

telecommunications infrastructure.[2] We noted, however, that there was a lack of general agreement on the specifics of methodology for deriving prices based on LRIC or total service long-run incremental cost (TSLRIC). We invited parties to comment on whether we should require the states to employ a LRIC-based pricing methodology and to explain with specificity the costing methodology they support.[3] We recognized, however, that prices based on LRIC might not permit recovery of forward-looking costs if there were significant forward-looking joint and common costs among network elements.[4] We sought comment on how, if rates are set above incremental cost, to deal with the problems inherent in allocating common costs and any other overheads.[5] We observed that, by defining the unbundled elements at a sufficiently aggregated level, it may be possible to reduce the costs to be allocated as joint and common by identifying a substantial portion of costs as incremental to a particular element. To the extent that joint and common costs cannot be entirely eliminated, we sought comment on various methodologies for assigning them, including the use of a fixed allocator or on the basis of inverse demand elasticity. We also sought comment on whether, regardless of the method of allocating common costs, we should limit rates to levels that do not exceed stand-alone costs.[6] Finally, we invited parties to comment on whether a LRIC-based methodology would establish a price for interconnection and unbundled network

elements that includes a reasonable profit and thus complies with section 252(d)(1).[7]

631. A number of states already employ, or have plans to utilize, some form of LRIC or TSLRIC methodology in their approach to setting prices for unbundled network elements,[8] with several states choosing LRIC or TSLRIC as a price floor.[9] For instance, the Connection Commission adopted a TSLRIC methodology to measure the cost of service on SNET, its principal incumbent LEC.[10] Arizona also requires incumbent LECs to conduct TSLRIC costs studies to establish the

U S West Communications*, Docket No. UT-950200 at 82 (Washington Commission, April 11, 1996)); Wisconsin Stat. Ann. section 196.204 (requiring the price of each network service or function to exceed TSLRIC).

[10] Connecticut Commission comments at 4.

underlying cost of unbundled services and facilities.[11] The Ohio Commission has adopted Long Run Service Incremental Cost ("LRSIC") , which is closely related to TSLRIC.[12] The Missouri and Wyoming Commissions are among a number of state commissions that have not yet adopted a pricing methodology, but are considering LRIC or TSLRIC.[13] Oklahoma law provides for submission of LRIC cost studies and studies identifying a contribution to common costs for interconnection of facilities and access to network elements to the Oklahoma Commission during an arbitration.[14] A number of states have yet to choose a pricing methodology. For instance, the New York Commission sets prices on a case-by-case basis.[15] Unbundled element prices also exist in several states pursuant to negotiated interconnection agreements that

have either already been approved by state commissions or are under consideration.[16]

632. Section 252(d)(1) requires, *inter alia*, that rates for interconnection and unbundled network elements be based on "cost (determined without reference to a rate-of-return or other rate-based proceeding)."[17] We tentatively concluded in the NPRM that this language precludes states from setting rates by use of traditional cost-of service regulation, with its detailed examination of historical carrier investment and expenses.[18] Instead, we indicated our belief that the statue contemplates the use of other forms of cost-based price regulation, such as the setting of prices based on forward-looking economic cost methodologies (such as LRIC) and do not involve the use of an embedded rate base. We sought comment on whether section 252(d)(1) forecloses consideration of historical or embedded costs or merely prohibits state commissions from conducting a traditional rate-of-return proceeding to establish prices for interconnection and unbundled network elements. Embedded costs are the costs that the incumbent LECs carry on their accounting books that reflect historical purchase prices,

[16] According to information in our possession, such agreements have been negotiated in, among other states, Alabama, Florida, Georgia, Kentucky, Illinois, Louisiana, Mississippi, North Carolina, South Carolina, and Tennessee. Letter from W.W. Jordan, Executive Director--Federal Regulatory, BellSouth, to William F. Caton, Acting Secretary, July 11, 1996 at Attachment (containing chart detailing agreements between BellSouth and new entrants in Alabama, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, and Tennessee); "Interconnection Agreement Under Sections 251 and 252 of the telecommunications Act of 1996, by and between, Ameritech Information Industry Services and MFS Intelenet of Illinois, Inc.," dated May 17, 1996 (filed July 25, 1996).

[17] 47 U.S.C. § 252(d)(1)(B).

[18] NPRM at para. 123.

regulatory depreciation rates, system configurations, and operating procedures. We invited parties to comment on whether incumbent LECs should be permitted to recover some portion of their historical or embedded costs over TSLRIC.[19]

633. In the NPRM, we noted that certain incumbent LECs had advocated that interconnection and access to unbundled element prices be based on the "efficient component pricing rule" (ECPR).[20] Under this approach, an incumbent LEC that sells an essential input element, such as interconnection, to a competing network would set the price of that input element equal to "the input's direct per-unit incremental costs plus the opportunity cost to the input supplier of the sale of a unit of input."[21] We tentatively concluded in the NPRM that ECPR or equivalent methodologies are inconsistent with the section 252(d)(1) requirement that rates be based on "cost," and we proposed to preclude the states from using this methodology.[22]

[22] NPRM at para. 148.

685. Under the third approach, prices for interconnection and access to unbundled elements would be developed from a forward-looking economic cost methodology based on the most efficient technology deployed in the incumbent LEC's current wire center locations. This approach mitigates incumbent LECs' concerns that a forward-looking pricing methodology ignores existing network design, while basing prices on efficient, new technology that is compatible with the existing infrastructure. This benchmark of forward-looking cost and existing network design most closely represents the incremental costs that incumbents actually expect to incur in making network elements available to new entrants. Moreover, this approach encourages facilities-based competition to the extent that new entrants, by designing more efficient network configurations, are able to provide the service at a lower cost than the incumbent LEC. We, therefore, conclude that the forward-looking pricing methodology for interconnection and unbundled network elements should be based on costs that assume that wire centers will be placed at the incumbent LEC's current wire center locations, but that the reconstructed local network will employ the most efficient technology for reasonably foreseeable capacity requirements.

[* * *]

696. We conclude that forward-looking common costs shall be allocated among elements and services in a reasonable manner, consistent with the pro-competitive goals of the 1996 Act. One reasonable allocation method would be allocate common costs using a fixed allocator, such as a percentage markup over the directly attributable forward-looking costs. We conclude that a second reasonable allocation method would allocate only a relatively small share of common costs to certain critical network elements, such as the local loop and collocation, that are most difficult for entrants to replicate promptly (*i.e.*, bottleneck facilities). Allocation of common costs on this basis ensures that the prices of network elements

that are least likely to be subject to competition are not artificially inflated by a large allocation of common costs. On the other hand, certain other allocation methods would not be reasonable. For example, we conclude that an allocation methodology that relies exclusively on allocating common costs in inverse proportion to the sensitivity of demand for various network elements and services may not be used.[23] We conclude that such an allocation could unreasonably limit the extent of entry into local exchange markets by allocating more costs to, and thus raising the prices of, the most critical bottleneck inputs, the demand for which tends to be relatively inelastic. Such an allocation of these costs would undermine the pro-competitive objectives of the 1996 Act.

---

[23] *See* Frank P. Ramsey, *A Contribution to the Theory of Taxation*, 37 Econ. J. 47 (1927); *see generally* Kenneth E. Train, *Optimal Regulation: The Economic Theory of Natural Monopoly* 115-40 (1992) (discussing efficiency properties of Ramsey prices); Bridger M. Mitchell & Ingo Vogelsang, *Telecommunications Pricing: Theory and Practice* 43-61 (1991). The sensitivity of demand is measured by the elasticity of demand, which is defined as the percentage change in the quantity of a service demanded for a one per cent change in price.

RULE 29.6 STATEMENT

Pursuant to Rule 29.6 of the Supreme Court Rules, the Rural Telephone Coalition ("RTC") and United States Telephone Association ("USTA") respectfully submit these disclosure statements.

RTC is comprised of the National Rural Telecom Association ("NRTA"), the National Telephone Cooperative Association ("NTCA"), and the Organization for the Promotion and Advancement of Small Telecommunications Companies ("OPASTCO"). Each of the associations in the RTC is a non-profit trade association representing the interest of facilities-based local exchange and exchange access providers. These companies are full members of the associations. Some of the associations also have international members who provide local exchange services in other jurisdictions, and associate members consisting of consultants, manufacturers, and other parties with interests in the local exchange carrier industry. Neither the RTC nor any of the associations have any parent companies, subsidiaries, or affiliates for whom disclosure is required by Rule 29.6.

USTA is a non-profit trade association representing the interest of facilities-based local exchange and exchange access providers. These companies are its full members. USTA also has international members who provide local exchange services in other jurisdictions, and associate members including consultants, manufacturers, banks and investors, and other parties with interests in the local exchange carrier industry. USTA has no parent companies, subsidiaries, or affiliates for whom disclosure is required by Rule 29.6.

CONSOLIDATED BRIEF FOR THE UNITED STATES TELEPHONE ASSOCIATION AND THE RURAL TELEPHONE COALITION IN OPPOSITION

STATEMENT

Respondent United States Telephone Association ("USTA") is a non-profit trade association that represents the interests of more than 1000 facilities-based local exchange and exchange access providers, most of which are small and mid-sized local exchange carriers ("LECs"). Respondent Rural Telephone Coalition ("RTC") is an alliance composed of three national trade associations, the National Rural Telecom Association ("NRTA"), the National Telephone Cooperative Association ("NTCA") and

the Organization for the Promotion and Advancement of Small Telecommunications Companies ("OPASTCO"), which together represent the interests of more than 850 small and rural incumbent LECs.

In the court of appeals, USTA and RTC joined with other parties to challenge the validity of FCC rules governing the price and other central terms of interconnection agreements that must be reviewed and approved by State commissions. USTA and the RTC also separately challenged the validity of two FCC rules of special significance to small and rural carriers: (1) 47 C.F.R. § 51.405, which required State commissions to apply restrictive standards of proof when determining whether small and rural carriers should be relieved of undue burdens imposed by the Act; and (2) 47 C.F.R. § 51.303, which required State commissions to review and approve all interconnection agreements adopted by carriers prior to the effective date of the Telecommunications Act of 1996 ("the 1996 Act"). The Eighth Circuit vacated both of these regulations based upon its conclusion that the text of 47 U.S.C. § 251(f) and § 252(a)—which assigns States the responsibility for making exemption determinations and reviewing interconnection agreements—also vests States with exclusive jurisdiction to establish the rules governing these State proceedings. Pet. App. at 28a, 36a. The Commission and the other Petitioners have now sought review of these rulings as part of their broad-based challenge to the decision of the Eighth Circuit. *See* FCC Pet. at (I) (question 1); AT&T Pet. at (i) (question 1); MCI Pet. at (i) (question 2); ALTS Pet. at (i) (question 2); *see also* FCC Pet. at 9, 11. Petitioners nevertheless fail to provide this Court with any background concerning these regulations or the statutory provisions they implement. We accordingly do so here.[1]

---

[1] This brief in opposition only addresses the Eighth Circuit's decision with respect to these two rules. USTA and RTC join the arguments set forth in the briefs of the Regional Bell Companies and GTE (the "Large LECs") and the Mid-Sized Local Exchange

1. Throughout much of this century, States have adopted specially tailored policies designed to maintain the investment incentives of the small and rural carriers that provide service to remote areas.[2] Providing universal service to rural areas has presented challenging policy issues for many decades because the high cost associated with the delivery of rural service makes it difficult for telephone companies to offer customers affordable rates or to provide investors with attractive rates of return. Small carriers that have made the substantial investment in rural markets are obligated to serve their entire local exchange service areas as "carriers of last resort." As a consequence, these small businesses are particularly vulnerable to "cream skimming" by new entrants that target only high-volume business users in the rural territories. *See, e.g.*, H.R. Rep. No. 81-246, at 8 (1949) ("1949 House Report") (observing that Congress imposed area-wide coverage requirements because telephone companies were "running their lines down the highways into the most profitable areas and relegating farmers in the less profitable service areas perpetually to a nontelephone hinterland"). Left unchecked, the loss of even one or two high-volume customers in a rural market will drive up the costs of serving the rural LEC's remaining residential customers and/or diminish the economic viability of the rural service providers. The efficiency and public policy justifications for introducing vigorous competition accordingly have been far less apparent in rural markets than in densely populated urban areas where vast economies of scale and lower cost services are possible.[3]

Carriers (the "Mid-Sized LECs") with respect to other aspects of the Eighth Circuit's opinion.

[2] *See, e.g., Northwestern Bell Telephone Co.*, 71 Pub. Util. Rep. (PUR) 1, 11 (S.D. PUC 1947) (stating that "it is the general policy of this Commission to encourage the extension of exchange service to every community and household of the state").

[3] *See* John C. Panzar & Steven S. Wildman, "Competition in the Local Exchange: Appropriate Policies to Maintain Universal

2. In enacting the Telecommunications Act of 1996, Congress fundamentally changed the nature of competition in the markets for local telecommunications services by removing many competitive barriers to entry. But Congress did not renounce decades of special policies designed to enable small companies to provide service and update their networks in rural areas, or the primacy of the States' role in fostering the success of these rural ventures. Congress' plan to give State commissions authority to prevent unchecked competition in rural markets is reflected in numerous provisions of the 1996 Act.

Under Section 253(a), States may not prohibit firms from providing "any interstate or intrastate telecommunications service" *except* in rural markets. In Section 253(f), Congress authorizes States to require any firm entering a market served by a rural telephone company to provide universal service throughout the market so as to prevent the entry of competitors seeking to "cream skim" rural markets. Congress then made the entry of a second carrier in rural markets even more difficult through the terms of its rules governing financial support for carriers providing universal service. Congress gave States authority to determine which carriers should be eligible to receive universal service funding in each market, and provided that only one carrier would be eligible for universal service funding in "an area served by a rural telephone company," unless the State commission makes an express finding that it would serve the "public interest" to authorize additional universal service carriers. 47 U.S.C. § 214(e)(2).

Congressional differentiation of competition policies to be administered by the States in rural markets is further reflected in Section 251(f), which establishes two statutory

---

Service in Rural Areas," at 4-8, attached to Testimony of Lawrence C. Ware, Rural Telephone Coalition, House Energy and Commerce Subcommittee on Telecommunications and Finance, H.R. 3636 (Feb. 9, 1994) (hereinafter "Panzar").

mechanisms to relieve small and rural telephone companies of undue burdens. Section 251(f)(1) grants "rural telephone compan[ies]" [4] an exemption from the competitive obligations imposed on incumbent LECs by Section 251(c)—obligations that include mandatory requirements for incumbent carriers to provide competitors interconnection with their facilities and to make available unbundled network elements.[5] 47 U.S.C. § 251(f). States are given express authority to administer this exemption. State commissions—and not the FCC—must determine whether to terminate the Section 251(f)(1) exemption if a carrier makes a "bona fide request" for interconnection and files notice of the request with the State commission. The rural exemption only terminates if the "State commission determines" that "such request is not unduly economically burdensome," is "technically feasible," and is otherwise "consistent" with certain universal service provisions of Section 254. 47 U.S.C. § 251(f)(1)(A).

Congress also gave States authority to grant discretionary relief to any LEC (including a rural telephone company) that has "fewer than 2 percent of the Nation's subscriber lines installed in the aggregate nationwide" (referred to herein as "small companies"). These companies may petition a "State commission" for a suspension or modification of any requirement imposed by Section

---

[4] The definition of a "rural telephone company" is established in 47 U.S.C. § 153(37).

[5] Congress recognized the need to include some type of exemption or waiver provision to create a "level playing field, particularly when a company or a carrier to which this subsection applies faces competition from a telecommunications carrier that is a large global or nationwide entity that has financial or technological resources that are significantly greater than the resources of the company or carrier." S. Rep. No. 104-23, at 22 (1995) ("Senate Report"); *see also* H.R. Rep. No. 104-204, pt. 1, at 74 (1995) ("House Report") (rural exemption necessary to avoid "significant costs associated with seeking a modification or waiver before the Commission"). Such concerns culminated in Section 251(f).

251(b) or Section 251(c). 47 U.S.C. § 251(f)(2). A petition filed under this section may be granted by the State commission if it finds that the suspension or modification is necessary to avoid a "significant adverse economic impact on users of telecommunications services generally," an undue economic burden, or a requirement that is "technically infeasible," to the extent consistent with "the public interest." 47 U.S.C. § 251(f)(2)(A), (B). The FCC is mentioned only once in Section 251(f): when a State commission terminates a rural carrier's exemption under Section 251(f)(1), it is directed to establish a compliance schedule consistent with Commission regulations. 47 U.S.C. § 251(f)(1)(B).

3. The 1996 Act also preserved State responsibility for regulating rural carriers' agreements with larger, non-competing LECs. For many years, rural telephone carriers have depended upon "co-carrier" relationships with larger companies to provide efficient service to rural subscribers. *See* Panzar at 34. Such joint arrangements between non-competing LECs have served to reduce modernization costs and preserve revenues for universal service. For example, Extended Area Service ("EAS") arrangements between rural LECs and their neighboring large LECs enable rural and urban subscribers to call each other without incurring long distance charges. The prices of shared service components for rural LECs under such agreements are generally lower than prices made available to requesting carriers in a competitive marketplace. *See id.* at 41.

Rural carriers entered into hundreds of agreements of this type prior to the effective date of the 1996 Act, and one of the questions at issue in this case is how these agreements are affected by the terms of the Act. As described in the opposition briefs of the Large and Mid-Sized LECs, Sections 251 and 252 of the Act seek to introduce competition through reliance on private party negotiations and State commission review and approval of interconnec-

tion agreements. Section 252(a)(1) provides that an incumbent local exchange carrier "may negotiate and enter into a binding agreement with the requesting telecommunications carrier" upon receipt of a "request for interconnection, services, or network elements pursuant to section 251." 47 U.S.C. § 252(a)(1). Section 252(e) in turn provides that "[a]ny interconnection agreement adopted by negotiation or arbitration" under Sections 251 or 252 "shall be submitted for State approval." 47 U.S.C. § 252(e)(1). The Act does not clearly say whether State commissions must require agreements "negotiate[d] and enter[ed] into" before the effective date of the Act to be submitted to them for review and approval, although it clearly does require submission of an agreement which was "negotiated" before the enactment date, but executed afterwards. 47 U.S.C. § 252(a)(1).

4. There is no dispute that Congress authorized States to adopt implementing regulations to fulfill their obligations to conduct exemption and suspension proceedings under Section 251(f) and interconnection approval proceedings under Section 252. *See* 47 U.S.C. § 261(b) (stating that "[n]othing in this part shall be construed to prohibit any State commission . . . from prescribing regulations . . . in fulfilling the requirements of this part [including Section 251(f) and Section 252(a)], if such regulations are not inconsistent with the provisions of this part"). The FCC confirmed this reading in its order by acknowledging that "we expect that states will interpret the requirements of section 251(f) through rulemaking and adjudicative proceedings." *First Report and Order* at ¶ 1251 (App. 2a). The FCC nevertheless decided to prevent States from adopting their own interpretations of central terms of Section 251(f) and Section 252(a) through rulemaking or adjudications. The Commission instead adopted "national rules" and directed States to render decisions that "conform to our rules." Pet. App. at 173a.

The national rule promulgated under Section 251(f) required State commissions to adhere to a restrictive interpretation of the standards for relief established under Section 251(f). First, Rule 51.405 displaced the three prerequisites for terminating an exemption established under Section 251(f)(1)—technical feasibility, undue economic burden, and consistency with universal service provisions—with a single "embellish[ed]" standard, Pet. App. at 28a, that required termination of any exemption absent proof that the request would impose an "undue economic burden." [6] Second, the FCC determined that an "economic burden" warranting relief could not include any "economic burden that is typically associated with efficient competitive entry." 47 C.F.R. § 51.405(c); Pet. App. at 307a. Third, once a bona fide request is made by a requesting carrier, the FCC's rule assigned the burden of proof to rural telephone companies, based on the Commission's view that "it is appropriate to place the burden of proof on the party seeking relief from otherwise applicable requirements," without analyzing the text of the relevant provisions. *First Report and Order* at ¶ 1263 (App. 2a-3a).

The national rule promulgated under Section 252(a) required State commissions to review and approve hundreds of preexisting agreements between non-competing, neighboring LECs, including EAS agreements. The FCC interpreted the language of Sections 252(a) and (e) to require approval, despite its acknowledgment that such agreements "were negotiated under very different circumstances, and may not provide a reasonable basis for interconnection agreements under the 1996 Act." *First Report and Order* at ¶ 170 (App. 1a-2a).

---

[6] The FCC asserted in the Eighth Circuit that it did not intend to displace the other prerequisites for termination of a rural exemption, but the terms of the rule expressly provided otherwise. *See* 47 C.F.R. § 51.405(c) ("In order to justify continued exemption . . . an incumbent LEC must offer evidence . . . [of] undue economic burden . . . .").

5. The Eighth Circuit vacated the FCC's pricing regulations because they "exceeded" the FCC's jurisdiction. *Iowa Utilities Board v. FCC*, No. 96-3321 (8th Cir. July 18, 1997), Pet. App. at 1a, 8a. This determination was based upon an analysis of the text of the provisions governing the States' authority to regulate pricing in local exchange markets. *Id.* at 8a-27a. The Eighth Circuit also vacated non-price rules where the text of the 1996 Act established congressional intent to vest the States with exclusive jurisdiction.

The Eighth Circuit vacated the FCC's rules governing State rural exemption, suspension and modification proceedings because the "plain meaning of subsection 251(f)(1) (governing exemptions) and 251(f)(2) (governing suspensions and modifications) indicates that the state commissions have the exclusive authority to make these determinations." *Id.* at 28a. The court emphasized that "nothing in either of these provisions, or in the Act generally, provides the FCC with the power to prescribe the governing standards for such determinations." *Id.* In contrast to the "repeated and exclusive" references to State commission determinations in Section 251(f), the court of appeals found absolutely "no indication that state commissions must follow FCC standards" in conducting exemption, suspension or modification inquiries. *Id.* The court found that this conclusion was further confirmed by the fact that Congress had rejected both a Senate bill and a House bill giving the FCC concurrent jurisdiction with State commissions to administer these provisions. *Id.* at 29a. The court held that it would be "unreasonable to infer from subsection 251(d) or the other general rulemaking provisions cited by the FCC that Congress intended to put the Commission—the agency it decided to exclude from the exemption process—in a position to dictate the substantive standards governing the exemption process." *Id.* at 29a-30a. After resolving the issue based on the language of Section 251(f) alone, the court of appeals found that Section 2(b) created an additional ground for its decision.[7] *Id.* at 30a ("[S]ection 2(b)

bars" the FCC's rule "as well."). The court reasoned that "determinations of whether small or rural LECs should receive exemptions, modifications, or suspensions" of interconnection duties qualify as "practices or regulations" which are made "in connection with intrastate communication service" within the meaning of Section 2(b). *Id.* The court declined to address respondents' substantive challenges to the regulation in light of its jurisdictional holding. *Id.*

The Eighth Circuit also vacated the FCC's rule requiring State commissions to review and approve all preexisting interconnection agreements. The Eighth Circuit determined that "[n]othing" in Section 252 "can be read to authorize the FCC to issue regulations regarding which interconnection agreements must be submitted for state approval." Pet. App. at 35a. The court emphasized that Section 252 "establishes the procedures and standards that *state commissions* must follow when approving and arbitrating agreements under the Act." *Id.* (emphasis in original). Acknowledging the FCC's "grasp for some sort of statutorily-based jurisdiction over these interconnection agreements," the court of appeals nevertheless concluded that "section 2(b) forecloses the ability of the Commission to determine which interconnection agreements must be submitted for state commission approval." *Id.* at 36a, 35a. The court concluded that this issue must be resolved by State commissions. *Id.* at 36a & n.26.

The Eighth Circuit also rejected the FCC's attempt to compel States to conform their decisions to its "national rules" (Pet. App. at 173a) for an additional reason. As the Eighth Circuit explained, the FCC's order "purport[ed] to preempt any state policy that conflicts with an FCC regulation promulgated pursuant to section 251." Pet.

---

[7] Section 2(b) of the Act provides that "nothing in this chapter shall be construed to apply or to give the [FCC] jurisdiction with respect to . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communications service." 47 U.S.C. § 152(b); Pet. App. at 15a.

App. at 36a. The court reiterated its conclusion that the "FCC's authority to prescribe and enforce regulations to implement the requirements of section 251 is confined to the six areas in this section where Congress expressly called for the FCC's participation." *Id.* at 37a. The court found, in addition, however, that the statutory provisions governing the scope of FCC preemption of State rules, set forth in 47 U.S.C. § 251(d)(3) and § 261 "further constrain[] the FCC's authority." *Id.* The court emphasized that the plain language of Section 251(d)(3) established that the FCC could not preempt State commission orders establishing interconnection obligations so long as they are "consistent with the requirements of section 251" and do not "substantially prevent the implementation of the requirements of section 251 and the purposes of Part II." *Id.* The court explained that "[t]his provision does not require all state commission orders to be consistent with all of the FCC's regulations promulgated under section 251," because it is "entirely possible for a state interconnection or access regulation . . . to vary from a specific FCC regulation and yet be consistent with the overarching terms of section 251." *Id.* at 37a-38a. The FCC would accordingly have no basis to preempt such State rules merely because it had jurisdiction to speak on the subject.

REASON FOR DENYING THE WRIT

Petitioners ask this Court to conduct an expansive review of numerous issues of statutory interpretation resolved by the Eighth Circuit in accordance with settled principles. The three justifications they advance for conducting plenary review of the Eighth Circuit's decision are as unpersuasive with respect to the FCC's rules governing small carriers and preexisting LEC agreements as they are with respect to the FCC's pricing rules.[8]

---

[8] Respondents USTA and RTC join the arguments set forth in the briefs of the Large LECs and the Mid-Sized LECs.

First, the court's conclusions that the FCC had no jurisdiction to displace the States' authority to implement and apply the rural exemption of Section 251(f), or to force State commissions under Section 252(a) to require the filing of thousands of carrier-to-carrier agreements (with no discretion to evaluate which agreements warrant submission), are firmly supported by the specific language, structure and purpose of those sections. Second, contrary to the FCC's assertion, the court of appeals' reading of Section 2(b) does not "conflict in principle" with other precedents, FCC Pet. at 11, and even if it did, the court's interpretation of 2(b) was not "[c]entral to [its] analysis of the Commission's statutory jurisdiction." *Id.* at 17. The Eighth Circuit plainly stated that its jurisdictional analysis did not depend upon its reading of Section 2(b).

Third, there are no "practical" considerations that warrant review. *Id.* at 22. In less than two years, more than a thousand interconnection agreements involving nearly 300 companies have been signed and approved by State commissions across the nation, and States have been conducting exemption and suspension proceedings without need of FCC guidance. Contrary to the FCC's claims (Pet. at 23), there is no reason to conclude that Congress was attempting to ensure that the FCC's rulemaking would culminate in binding, nationwide rules on the underlying issues of statutory interpretation. Congress unquestionably did not mandate these FCC rules; expressly confirmed the jurisdiction of State commissions to address these questions; and expressly preserved State rules that do not conflict with the terms of the Act from FCC preemption. There accordingly is no "Congress[ional] direct[ive]" to secure an immediate nationwide resolution of all these issues. *Id.* Rather the Act was designed to permit the States to consider these important questions in the context of competition issues now arising in their local markets.

1.a. The FCC contends that Section 251 "prescribes a set of new federal standards to govern the development

of competitive local telephone markets," citing Section 251(f), which Congress allegedly authorized it to interpret and implement. FCC Pet. at 11. In fact, few provisions in the 1996 Act more clearly illustrate Congress' plan to grant the States exclusive authority to implement certain provisions of the 1996 Act governing competition in intrastate markets. The court of appeals correctly concluded that the "plain meaning" of Subsections 251(f)(1) and (2) "indicates that the state commissions have the exclusive authority to make [rural exemption] determinations." Pet. App. at 28a. The text of Section 251 cannot reasonably be read to authorize the FCC to adopt regulations governing the standards applicable to State commission proceedings under Section 251(f). Subsection 251(f)(1)(B) "explicitly provides, '*The State commission* shall conduct an inquiry for the purpose of determining whether to terminate the exemption under subsection paragraph (A).'" *Id.* at 28a (emphasis added). The court emphasized that there are "[r]epeated and exclusive references to such state commission determinations . . . contained throughout subsection 251(f)," while "[i]n contrast, there is no indication that state commissions must follow FCC standards in conducting these inquiries." *Id.*

As the Eighth Circuit further found, Congress "is capable of clearly expressing its desire to grant the FCC authority . . . when in wishes to do so." *Id.* at 14a. Thus, for example, subsection 252(c)(1) requires a State commission to ensure that the resolution of "open issues" in arbitration proceedings conducted by State commissions under the terms of the Act "meet the requirements of section 251 of this title, *including the regulations prescribed by the Commission pursuant to section 251.*" 47 U.S.C. § 252(c)(1) (emphasis added).[9] Congress provided no

---

[9] Under the statute, the FCC is specifically authorized to issue regulations under subsections 251(b)(2) (number portability), 251(c)(4)(B) (limitations on resale), 251(d)(2) (unbundled network elements), 251(e) (numbering administration), 251(g) (con-

such direction to the State commissions conducting exemption, suspension, and modification proceedings. Instead, Congress indicated that States were only required to enter orders establishing "an implementation schedule" for compliance "that is consistent in time and manner with Commission regulations" once they have concluded that the termination of an exemption is warranted. 47 U.S.C. § 251(f)(1)(B); *see* Pet. App. at 29a. The fact that Congress only directed State commissions to adhere to specified Commission regulations "[u]pon termination of [an] exemption" negates any inference that Congress impliedly authorized the FCC to adopt other rules governing a State commission's resolution of requests pertaining to exemptions under Section 251(f). 47 U.S.C. § 251(f)(1)(B).[10]

The FCC's claim that Congress intended rural exemption determinations to be subject to federal regulations is further undermined by the fact that Congress expressly rejected versions of Section 251(f) which gave the FCC concurrent jurisdiction with State commissions to administer the exemption and waiver provisions for small local exchange carriers. The Senate bill provided that the Com-

---

tinued enforcement of exchange access), and 251(h)(2) (treatment of comparable carriers as incumbents). Pet. App. at 12a n.10, 29a n.23.

[10] Indeed, the interpretation of the 1996 Act that the FCC has advocated would in fact render this language of Section 251(f)(1)(B) superfluous. Under the Commission's reading of the Act, all of the State commission's determinations under Section 251(f) must "comply with the Commission's regulations." *First Report and Order* at ¶ 101, Pet. App. at 201a. But if the FCC already possesses broad authority to adopt regulations implementing Section 251(f) as it alleges—regulations which the States would be obligated to apply in resolving requests for relief under that section—it would have been completely unnecessary for Congress to direct the States to adopt an implementation schedule that conformed to Commission regulations. It is apparent, therefore, that Congress simply did not authorize the Commission to adopt any other regulations implementing Section 251(f).

mission *or* a state could provide small companies with relief from the obligations of Section 251. *See* S. 652, 104th Cong. § 251(i) (1996); Senate Report at 22. The House bill gave State commissions authority to administer exemption and waiver provisions for rural telephone companies, but also gave the FCC authority to grant waivers for any local exchange carrier with fewer than 500,000 access lines installed. *See* H.R. 1555, 104th Cong. § 242(e)-(g) (1996). Both of these bills were rejected in conference, and the States were given *sole* authority to conduct exemption, suspension and modification proceedings for all small carriers. *See* 47 U.S.C. § 251(f)(1)-(2). The FCC's effort to claim dual jurisdiction to control the resolution of exemption proceedings in State commissions after Congress deliberately excluded the FCC from the process was correctly rejected by the court of appeals. *See* Pet. App. at 29a; *Russello v. United States*, 464 U.S. 16, 23 (1983) (declining to adopt an interpretation at odds with changes in the language of a bill).

The language and history of Section 251(f) make its intent plain. Congress determined that State agencies are better situated to evaluate the special concerns of rural areas, and to administer provisions designed to shield small companies operating in their jurisdictions from unduly harmful effects of the new obligations. Under these circumstances, it is unreasonable to infer that Congress nevertheless meant to put the FCC—the agency it decided to exclude from the exemption process—in a position to dictate the substantive standards that states should apply in their own agency proceedings (let alone to rewrite the statutory standard).

The fact that FCC rules may promote national uniformity on selected issues is beside the point. *See* FCC Pet. at 22-23; *First Report and Order* at ¶¶ 53-62, Pet. App. at 165a-173a. If Congress believed that national uniformity in the administration of Section 251(f) was a paramount consideration, it would have granted the FCC exclusive jurisdiction to adjudicate these proceedings. It

did not do so. Congress instead chose to vest these decisions in 50 separate sovereigns, and did not even establish a right to direct review in federal district courts of State commission exemption or suspension determinations. *See* 47 U.S.C. § 252(e)(6) (limiting direct federal court review to State decisions approving interconnection agreements). There is simply no basis to infer that Congress empowered the FCC "to promulgate standards governing state commission determinations of exemptions and modifications." Pet. App. at 29a.[11]

b. Subsections 252(a) and (e) of the Act require interconnection agreements to be approved by State commissions. In its pursuit of increased competition at any cost, the FCC determined that States must review and approve *all* interconnection agreements that predated the passage of the Act. The FCC reached this conclusion even though the State of Wisconsin, for example, had interpreted Section 252(a) to exclude agreements executed before the effective date, and explained the unwarranted burdens the FCC's interpretation would impose on State commissions. Petition for Reconsideration by Public Service Commission of Wisconsin, *In re Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, CC Docket No. 96-98 (Sept. 30, 1996). Under this interpretation, hundreds of contracts negotiated under "very different" competitive circumstances. *First Report and Order* at ¶ 170 (App. 1a-2a), must be reviewed by State commissions. The Eighth Circuit correctly vacated the rule based upon its finding that State commissions—not the FCC—were given authority to interpret the scope of their own obligations under these sections.

As set forth in the court of appeals' opinion, the FCC's jurisdiction to adopt regulations implementing the 1996

---

[11] The preemption provisions of the Act discussed *infra* at 22-24, further undercut the FCC's assertion that "nationally uniform interpretations" of interconnection or access obligations under the Act were either envisioned or intended by Congress. FCC Pet. at 23.

Act is limited in scope. Section 252 of the 1996 Act establishes the process and standards that *States* must follow when arbitrating and approving interconnection agreements. The FCC's role under this section is extremely circumscribed—indeed, it is limited only to stepping in to oversee the arbitration process in the event that a State commission refuses to act. *See* 47 U.S.C. § 252 (e)(5). The text and structure of Section 252 cannot reasonably be read to confer upon the FCC the authority to implement regulations specifying the obligations of interconnectors to submit their agreements for approval under Subsections 252(a) and (e). As the court found, these agreements "almost exclusively involve local intrastate telecommunication services," Pet. App. at 35a, where Congress has traditionally relied upon State commissions to regulate competition. The fact that Congress has established limited standards to guide the exercise of the States' discretion does not mean that the FCC is the final arbiter of how the States should implement those standards. The Eighth Circuit correctly determined that Congress assigned that role to the States.

2. The FCC and other Petitioners have attempted to construct an alleged "conflict[] in principle" among the circuits with respect to the court of appeals' conclusion that Section 2(b) of the Communications Act, 47 U.S.C. § 152(b), also constrained the FCC's ability to dictate every detail of local competition determinations. FCC Pet. at 20; *see* AT&T Pet. at 12-21. The agency argues first, that the court of appeals erred in applying 2(b) because Congress " 'straightforwardly' and comprehensively subjected competition in local telephone markets to" federal regulation, FCC Pet. at 17-18 (citing *Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355, 377 (1986)), and second, that even if the Commission's authority to "implement the core provisions of Sections 251" were ambiguous, Section 2(b) would still pose no bar because "the regulatory subjects of Sections 251 and 252

are inextricably both interstate and intrastate in character." FCC Pet. at 19.

The flaws in the Commission's challenge to the Eighth Circuit's analysis of Section 2(b) are discussed in the opposition briefs of the Large LECs. Those arguments apply fully to the small company issues addressed here. As the court of appeals found, "determinations of whether small or rural LECs should receive exemptions, modifications, or suspensions of such duties also qualify as practices or regulations 'for or in connection with intrastate telecommunications service' that are outside of the FCC's jurisdiction by the operation of section 2(b)." Pet. App. at 30a (quoting 47 U.S.C. § 152(b)). Similarly, the court of appeals correctly determined that Section 2(b) "forecloses the ability of the Commission to determine which interconnection agreements" governing intrastate service "must be submitted for state commission approval." *Id.* at 35a. As the briefs of the Large LECs demonstrate, these conclusions do not conflict with the decisions of any other circuit.

Any error in the Eighth Circuit's Section 2(b) analysis would not, in any event, warrant review. The FCC's effort to characterize the court's interpretation of Section 2(b) as "[c]entral" to its "analysis of the Commission's statutory jurisdiction," FCC Pet. at 17, for purposes of creating an issue worthy of certiorari, does not withstand scrutiny. The Eighth Circuit clearly premised its decision on an independent analysis of the text of each statutory provision, and Section 2(b) was only cited as an additional reason for its determination—not the "central" reason. When interpreting the Section 251(f) rural exemption, for example, the court of appeals thoroughly analyzed the language and structure of that section in concluding that the "plain meaning" of Subsection 251(f)(1) and (f)(2) "indicates that the state commissions have the exclusive authority to make" rural exemption determinations, and that "nothing" in the text of Section 251(f),

"or in the Act generally, provides the FCC with the power to prescribe the governing standards for such determinations." Pet. App. at 28a. Only then did the court find that Section 2(b) stands as an independent bar to the exercise of FCC jurisdiction "as well." *Id.* at 30a.

3. Finally, the FCC believes that certiorari is justified because the Eighth Circuit's decision, on a "practical level," is somehow "imped[ing] the competition that Congress sought to bring to local telephone markets" by preventing a swift nationwide resolution of all central issues of statutory interpretation. FCC Pet. at 22. This argument failed when the FCC unsuccessfully requested this Court to vacate the Eighth Circuit's stay of the FCC's pricing rules. *See* FCC Application to Vacate Stay at 27, *FCC v. Iowa Utilities Board*, No. A-299 (Oct. 24, 1996). It should also fail now.

a. Contrary to the FCC's assertions, the Section 251-252 framework of private party negotiations and State commission arbitration crafted by Congress has been working well since the Act's passage to foster the emergence of local exchange competition. To date, *hundreds* of local interconnection agreements have been signed since the Act's passage, with new competitors emerging each day in local telephone markets. National Association of Regulatory Utility Commissioners, *Telecommunications Competition Report* at iii-iv (Sept. 1997). That process would be even more effective if the FCC had not decided, in the most intrusive manner possible, to inject itself into the private party negotiations and State commission arbitration process. Congress intended private parties first, and then the States, to be the impetus for the development of local competition. Congress did *not* invite the FCC to introduce more than 700 pages of binding federal guidance into Congress' "pro-competitive, de-regulatory" program.

b. The FCC has offered no evidence that the Eighth Circuit's decision has disrupted the State process for de-

ciding issues concerning the rural exemption or the submission of interconnection agreements. As a practical and policy matter, Congress' deference to the States with respect to local interconnection matters generally, and with respect to rural exemption and interconnection agreement filing issues in particular, makes perfect sense. The State commissions are the agencies with the particular knowledge and expertise regarding the status of local competition in their States, and the specific carriers that are either incumbent, emerging and or at risk when local competition is introduced.

Two examples illustrate the fact that Congress' scheme is working better without the FCC's mandatory directives to State commissions on these small company issues. The Alabama Public Service Commission recently considered the "financial and technical limitations of [Alabama's] small LECs"; found that the interconnection obligations imposed by Subsections 251(b) and (c) would impose undue economic burdens; and temporarily suspended those obligations pending further review of "the effects of competitive entry" on Alabama's rural carriers. *In re All Telephone Cos. Operating in Alabama,* Docket No. 24472 (LEXIS, Pub. Util. Rep. 4th, slip op.) (Oct. 8, 1996). Significantly, that determination was based upon a reasonable interpretation of the Act *without* reference to the FCC's "embellish[ed]" and restrictive standard of proof for rural exemption, suspension and modification proceedings, Pet. App. at 28a, which otherwise could have significantly impeded Alabama's ability to shape competition policy in accordance with the needs of Alabama's small carriers and their customers.[12] Similarly, some State

---

[12] Congress established that State commissions could not terminate an exemption or deny a suspension or modification, when the imposition of certain obligations under Section 251 would be "unduly economically burdensome." *See* 47 U.S.C. § 251(f)(1)(A) and (2)(A)(ii). This was the standard that Alabama applied. Section 51.405(c) and (d) of the FCC's new rules, however, would have required proof of an "undue economic burden" other than an

commissions have been assessing what types of agreements should be filed under Section 252(a) pursuant to their own reasonable interpretations of the Act. Minnesota, for example, has commenced a proceeding to determine whether EAS agreements, which are of enormous importance to small and rural carriers, in fact represent the type of agreements that should be subject to Section 252(a) filing and approval requirements. *See In re US WEST Communications, Inc.*, Docket No. P-421, 1997 WL 634623 (Minn. P.U.C. June 24, 1997). Under the FCC's mandatory rules, that inquiry would have been foreclosed because the FCC determined that all pre-existing agreements, including EAS agreements, had to be filed

---

"economic burden that is typically associated with efficient competitive entry." 47 C.F.R. § 51.405(c), (d) (emphasis added). Under this new "efficient competitive entry" standard—which appears *nowhere* in the statutory text—State commissions such as Alabama would have been required to disregard losses that would threaten the viability of a rural telephone company if such losses would be attributable to the entry of a more efficient competitor seeking to serve part of a rural market. *Compare* 47 U.S.C. § 613(d)(3), (e) (defining an "undue burden" in another section of the Communications Act to include *any* "significant difficulty or expense"); *Air Line Pilots Ass'n, Int'l v. Civil Aeronautics Bd.*, 494 F.2d 1118, 1124 (D.C. Cir. 1974), *cert. denied*, 420 U.S. 972 (1975) (interpreting similar phrase in statute creating small carrier exemption from economic regulatory provisions of the Federal Aviation Act to reflect intent to keep small carriers "economically viable"). That reasoning completely ignores the fact that Congress understood the need to give States substantial latitude to mitigate the impact of the Act on rural telephone companies and their customers. *See, e.g.*, 47 U.S.C. §§ 253(f), 214(e). The Commission's interpretation of Section 251(f) arbitrarily advanced one congressional policy—promoting competition—at the expense of another congressional policy—preserving the economic viability of rural telephone companies, and the interests of communities they serve, during this period of great change. *See Estate of Thompson v. Commissioner*, 864 F.2d 1128, 1134-36 (4th Cir. 1989) (rejecting agency interpretation that did not give full effect to congressional purpose of protecting family farms and small businesses). For this reason as well, the FCC's rule was properly vacated by the court of appeals.

with State commissions. *See* Pet. App. at 287a-88a (text of 47 C.F.R. § 51.303).

The actions taking place in the States illustrate the problem with the FCC's emphasis on the alleged practical and policy need for "nationally uniform interpretations" regarding local competition issues. FCC Pet. at 23. Congress' point in crafting the Section 251-252 regime in fact was (and is) just the opposite: except for certain discrete matters where federal involvement is required by the Act, local competition determinations generally are not and should not be "nationally uniform." Instead, they must be tailored to the specific carriers, and the specific economic and competitive circumstances, that exist in particular markets.

c. The FCC's case for certiorari places substantial reliance on the claim that the Eighth Circuit's interpretation of the FCC's jurisdiction frustrates congressional intent by preventing "a single court of appeals" from "resolv[ing]" the "most fundamental issues arising under the Act" within "a year or two" of its effective date. FCC Pet. at 23. Yet, there is no reason to believe that Congress shared the Commission's view that this rulemaking proceeding should culminate in uniform national rules even if Congress granted the FCC concurrent jurisdiction to address these issues.

First, there is no dispute that Congress expected States to adopt interpretive rules when conducting rural exemption and interconnection proceedings, and that Congress did not *require* the FCC to adopt rules on the statutory questions at issue here. Congress was accordingly content to allow these issues to be resolved through State proceedings conducted over time.

Second, as the Eighth Circuit held, Congress did not allow the FCC to establish nationally uniform standards which categorically preempt contrary State rules *even if* it had concurrent jurisdiction. The Eighth Circuit rejected

the FCC's view that its rules "preempt any [different] state policy" as "untenable." Pet. App. at 36a. The Commission's assertion that State decisions implementing Sections 251 and 252 must conform to FCC regulations, even where Congress did not say so, is refuted by Section 261 and Section 251(d)(3).

Section 261 authorizes States to adopt implementing regulations to fulfill its obligations under the 1996 Act, and provides that such regulations do not have to conform to Commission regulations. Section 261(b) is explicit: "[*n*]*othing in this part* shall be construed to prohibit any State commission . . . from prescribing regulations . . . in fulfilling the requirements of this part, if such regulations are not inconsistent with the provisions of this part." 47 U.S.C. § 261(b) (emphasis added). Congress only required States to conform their actions to "the Commission's regulations" if they seek to adopt "additional" regulations beyond those enacted to "fulfill [] the requirements of this part." *See id.*; 47 U.S.C. § 261(c). Section 251(d)(3) further confirms the fact that State commissions are not obligated to implement Section 251 in accordance with national regulations adopted by the FCC. Under that section, Congress prohibited the agency from "prescribing . . . regulations" that would "preclude the enforcement" of any state "regulation, order or policy" that is consistent with the policies and requirements of Section 251. 47 U.S.C. § 251(d)(3). If Congress' goal was nationwide uniformity, it presumably would have drafted a far broader preemption provision.

Third, Congress clearly did not create a scheme where federal district courts would "supply nationally uniform interpretations" of all of the provisions construed by the FCC in its rules. FCC Pet. at 23. Congress did not even grant federal district courts jurisdiction to conduct direct review of State commission determinations issued under Section 251(f). *See* 47 U.S.C. § 252(e)(6).

The FCC's vision of a congressional plan for nationwide resolution of all these statutory issues in a single proceeding simply cannot be reconciled with the terms of the Act. Instead, Congress adopted a program that permits States to develop reasonable interpretations of the Act in the course of conducting the proceedings Congress assigned to them. Short-circuiting that process in the name of litigation expediency undermines the State's role in the statutory scheme without any justification in the text of the statute.

CONCLUSION

For the reasons set forth, petitioners respectfully request this Court to deny the petitions for certiorari.

APPENDIX

FROM *IN THE MATTER OF IMPLEMENTATION OF THE LOCAL COMPETITION PROVISIONS IN THE TELECOMMUNICATIONS ACT OF 1996*, FIRST REPORT AND ORDER, CC DOCKET NO. 96-98, FCC 96-325, ¶¶ 170, 1251, 1263 (AUGUST 8, 1996).

* * * *

170. Some parties have suggested that we provide parties an opportunity to renegotiate preexisting contracts. Parties, of course, may mutually agree to renegotiate agreements, but we decline to mandate that parties renegotiate existing contracts. In addition, as discussed below, commercial mobile radio service (CMRS) providers that are party to preexisting agreements with incumbent LECs that provide for non-mutual compensation have the option of renegotiating such agreements with no termination liabilities or contract penalties.[334] We believe that generally requiring renegotiation of preexisting contracts is unnecessary, however, because state commissions will review preexisting agreements, and may reject any negotiated agreement that "discriminates against a telecommunications carrier not a party to the agreement," or that "is not consistent with the public interest, convenience, and necessity."[335] We recognize that preexisting agreements were negotiated under very different circumstances, and may not provide a reasonable basis for interconnection agreements under the 1996 act. For example, non-competing neighboring LECs may have negotiated terms that simply are not viable in a competitive market. It would not foster efficient long-term competition to force parties to make available to all requesting carriers interconnection on terms not sustainable in a competitive environ-

---

[334] *See infra*, Section XI.A.

[335] 47 U.S.C. § 252(e)(2)(A).

ment. In such circumstances, a state commission would have authority to reject a preexisting agreement as inconsistent with the public interest. If a state commission approves a preexisting agreement, that agreement will be available to other parties in accordance with section 252(i). Contrary to NYNEX's assertion, once a state approves an agreement under section 252(e), that agreement is "approved under" section 252.

* * * *

1251. We discuss below issues raised by the commenters, and establish some rules regarding the requirements of section 251(f) that we believe will assist state commissions as they carry out their duties under section 251(f). For the most part, however, we expect that states will interpret the requirements of section 251(f) through rulemaking and adjudicative proceedings. We may in the future initiate a Notice of Proposed Rulemaking on certain additional issues raised by section 251(f) if it appears that further action by the Commission is warranted.

* * * *

1263. Given the pro-competitive focus of the 1996 Act, we find that rural LECs must prove to the state commission that they should continue to be exempt pursuant to section 251(f)(1) from requirements of section 251(c), once a bona-fide request has been made, and that smaller companies must prove to the state commissions, pursuant to section 251(f)(2), that a suspension or modification of requirements of sections 251(b) or (c) should be granted. We conclude that it is appropriate to place the burden of proof on the party seeking relief from otherwise applicable requirements. Moreover, the party seeking exemption, suspension, or modification is in control of the relevant information necessary for the state to make a determination regarding the request. A rural company that falls within section 251(f)(1) is not required to make any showing until it receives a bona fide request for interconnection, services, or network elements.

We decline at this time to establish guidelines regarding what constitutes a bona fide request. We also decline in this Report and Order to adopt national rules or guidelines regarding other aspects of section 251(f). For example, we will not rule in this proceeding on the universal service duties of requesting carriers that seek to compete with rural LECs. We may offer guidance on these matters at a later date, if we believe it is necessary and appropriate.

PETITIONER'S REPLY BRIEF

ARGUMENT

Although respondents cumulatively devote one hundred and fifty pages to opposing certiorari, they do not seriously contest that the petitions present questions of national importance that have not previously been decided by this Court. The case involves a profound jurisdictional dispute between federal and state regulators over the proper scope of their respective authority to implement the local competition provisions of the landmark Telecommunications Act of 1996, and an important substantive dispute about how new entrants such as MCI will be allowed to compete in local markets. Respondents' principal argument against plenary review of these issues is that the Eighth Circuit correctly resolved them. As the petitions for certiorari demonstrated, that is not so. In any event, this Court, and not a single court of appeals, should pronounce the last word on such matters of nationwide importance.

A. Respondents' Arguments Confirm That the Eighth Circuit's Decision to Invalidate Section 51.315(b) of the FCC's Rules Presents a Question of National Importance.

1. Most respondents do not deny that the invalidation of § 51.315(b) of the FCC's "combination" rules has severely set back prospects for local competition. Indeed the briefs in opposition are striking for what they do not say on this score. The State Commission Respondents and the National Association of Regulatory Commissioners ("the State Respondents"), for example, do not oppose certiorari on this issue. That is doubtless because these States recognize the importance of preventing the discriminatory conduct § 51.315(b) outlawed. Respondent GTE opposes certiorari on this question, but does not dispute that the Eighth Circuit's ruling is having enormous practical marketplace effects.

Only the Regional Bell Operating Company ("RBOC") respondents suggest that this issue is of "second level" importance (RBOC Brief in Opposition at 2 ("RBOC Br.")), but they have not sought to rebut the proof petitioners adduced about the decision's devastating effects. For example, the RBOCs do not deny that they are engaging in the discrimination permitted by the Eighth Circuit, or that their conduct has strangled local competition in its infancy. After all, the claim that the Eighth Circuit's invalidation of § 51.315(b) "effectively has killed off local competition" in much of the market was made not by petitioners but by independent telecommunications experts and investment analysts.[1] In other contexts (when it furthers their purposes), the RBOCs have frankly acknowledged the effect of the appeals court's ruling.[2] And the RBOCs say nothing about perhaps the most damning fact

---

[1] *See* MCI's petition for certiorari at 13 n.16 ("MCI Pet.").

[2] *See* Reply Brief in Support of Application by BellSouth for Provision of In-Region, InterLATA Services in South Carolina, FCC CC Docket No. 97-208, at 20 (filed Nov. 14, 1997) ("AT&T gambled its local business on a misreading of the 1996 Act, and lost.").

of all: nearly two years after the Act's passage, incumbent monopolists still control 99% of the local market.

Indeed, as their very defense of the Eighth Circuit makes clear, whether incumbents can break apart existing combinations of network elements before providing them is an issue of central importance. GTE and the RBOCs argue at length that had the Eighth Circuit not invalidated § 51.315(b), new entrants would have been able to engage in purported "regulatory arbitrage . . . lead[ing] to massive pressure on basic service rates and enormous losses for incumbents." RBOC Br. at 22. They contend the Eighth Circuit's ruling was necessary to steer new entrants away from extensive use of unbundled network elements to enter local markets, forcing them instead to rely principally on resale, thereby protecting implicit universal service subsidies which they claim are built into the resale rates, but not into the rates for unbundled network elements. In view of the importance respondents attach to whether incumbents may break apart existing combinations of network elements before leasing them to new entrants, it is not plausible to argue that this is a "second order" issue unworthy of this Court's attention.

2. Nor have the incumbent local exchange carrier ("ILEC") respondents presented a persuasive argument that the Eighth Circuit decided the issue correctly. They make virtually no effort to defend the decision under *Chevron USA, Inc. v. National Resources Defense Council, Inc.*, 467 U.S. 837 (1984). That is no surprise; the decision is indefensible on those terms. Instead, respondents frankly argue policy, contending that the invalidation of § 51.315(b) was necessary to preserve implicit universal service subsidies. This argument is meritless: it holds local competition hostage to the completion of universal service reform, while Congress clearly intended local competition to come first.

First, the argument's premise is demonstrably false. Congress did *not* impose artificial costs on service through combinations of unbundled elements to impede this kind of competition until the completion of universal service

reform. Neither did the Eighth Circuit's equally invalid policy judgment rest on this ground. Instead, Congress expressly made all three forms of competitive entry (resale, facilities-based, and combinations of network elements) immediately available, and expressed no preference as between them. And it was Congress, not the FCC, that intended local competition through all three routes of entry to start "as quickly as possible," [3] while at the same time declining to make universal service reform a precondition for opening local markets to competition via any of these three entry strategies. Indeed, the incumbents' plea for protection of implicit universal service subsidies flies in the face of § 254 of the Act, which requires that "any [universal service] support mechanisms . . . should be explicit, rather than implicit as many support mechanisms are today." [4] In other words, the incumbents are arguing that the 1996 Act should be interpreted to protect the very implicit subsidies which Congress sought to extirpate. If the incumbent monopolists believe that universal service reform instead should precede widespread local competition, their complaint is with the Congress, and not with the FCC.

Second, the solution proposed by the monopolists bears no relation to the purported problem respondents have identified. The costs of pointless taking apart and recombining permitted by the Eighth Circuit's ruling are entirely unrelated to the costs of the alleged subsidies which the monopolists claim they wish to preserve.[5] Neither would

---

[3] H.R. Rep. No. 104-204, 104th Cong., 1st Sess. at 89 (July 24, 1995).

[4] H.R. Conf. Rep. No. 104-458, 104th Cong., 2d Sess. at 131 (Jan. 31, 1996).

[5] As a result of the Eighth Circuit's ruling, incumbent monopolists will be able to impose these discriminatory costs whenever new entrants order any two or more elements in combination—not merely when new entrants seek to rely exclusively on unbundled elements to provide service. Thus, the incumbent can impose these discriminatory costs even if a new entrant has installed its own switch, and seeks only to lease two elements—the local loop to a

the discriminatory costs permitted by the Eighth Circuit ruling be phased out when universal service reform is completed.

Third, as a practical matter, there is no risk that the "cherry picking" respondents hypothesize would have any effect on the subsidies they assert justify their monopoly pricing before federal universal service reform is implemented on its scheduled date of January 1, 1999. Given the monopolists' overwhelming advantages of incumbency, competitors will not attract (or be able to serve) sufficient numbers of local customers in the twelve-month period before universal service reform should be completed. That is no doubt why Congress was not persuaded by these arguments, and mandated local competition in advance of universal service reform. Nor does the experience during the year that the combination regulation was in place before it was struck down by the Eighth Circuit support respondents' fear of "cherry picking:" new entrants have yet to make significant inroads on the monopolists' business and profits.

Fourth, and most importantly, it is clear that the Eighth Circuit was making fundamental decisions about national telecommunications policy, not following the plain meaning of § 251, when it invalidated § 51.315(b) of the FCC's rules. The Eighth Circuit accepted the incumbents' argument that it was important to add unnecessary costs to the provision of service through unbundled network elements in order to distinguish that service entry method from resale, even if that hobbled prospects for immediate local competition. But it is the very point of *Chevron* that such policy matters are left to the agency charged with implementing the law. That alone is sufficient reason for this Court to grant certiorari.

---

subscriber's home and the interface box that attaches the loop to the inside wiring.

B. The Scope of the FCC's Authority to Administer the 1996 Act is a Matter of National Importance That Needs to be Settled Definitively by This Court.

1. Respondents have not advanced a persuasive defense of the Eighth Circuit's decision to strip the FCC of authority to implement the pricing requirements of § 251. To begin with, respondents' defense rests on an implausible characterization of the 1996 Act. As respondents would have it, the Eighth Circuit simply effectuated Congress' desire to avoid federal intrusion "on the States' traditional jurisdiction exclusively to oversee intrastate telephone service" by granting the States "considerable latitude to make individual policy choices" about pricing methodologies. RBOC Br. at 5, 20; *see also* GTE Brief in Opposition at 22 ("GTE Br."). Leaving aside the substantial constitutional difficulties that would be inherent in any such effort to deputize the States to set national policy (*see* MCI Pet. at 26), § 251 itself is a massive intrusion on "the States' traditional jurisdiction," supplanting state law with comprehensive and detailed federal requirements designed to foster competitive markets —including express federal requirements governing price. *E.g.*, 47 U.S.C. §§ 251(c)(2), (c)(3), (c)(4), 252 (d). Moreover, Congress indisputably gave the FCC authority to prescribe binding national rules governing many important requirements of § 251, including all the substantive unbundling requirements of § 251(c)(3), and many of the resale requirements of § 251(c)(4). FCC rules in those areas intrude on the States' traditional intrastate authority just as much as did the pricing rules invalidated by the Eighth Circuit. A plausible defense of the Eighth Circuit's ruling therefore cannot rest on broadbrush invocations of federalism; it must explain why Congress would have chosen to deny the FCC authority to implement one important subset of the federal requirements of § 251 while granting the FCC authority to implement other important requirements of the very same provision. Respondents have not even attempted such a defense.

To the contrary, in cases under § 252(e)(6) of the Act reviewing state commission arbitration decisions, the ILEC respondents have uniformly sought to *deny* state commissions the very latitude they now assert § 251 confers. As respondent SBC Communications Inc. explained in demanding *de novo* review of state commission interpretations of § 251, allowing state commissions interpretive latitude "would not advance uniform application of federal law from one State to the next," and could risk "50 different interpretations in 50 different states." [6] Respondent US West has likewise pressed for *de novo* review because of "the need for uniform construction of federal law," and because no state commission has "the nationwide perspective required to implement *federal* telecommunications policies." [7] Respondent GTE has likewise argued that state commission judgments are entitled to no deference, for the same reasons.[8]

The principal issue on which the ILEC respondents have pressed their plea for nationwide uniformity is the *pricing requirement of § 251*—the very matter they here contend the Eighth Circuit properly left to the States. Indeed, the ILEC respondents have uniformly challenged state commission decisions to apply forward-looking cost methodologies, on the ground that § 251 unambiguously requires state commissions to use embedded cost methodologies that prevailed during the monopoly era Congress sought to end.[9]

---

[6] *Southwestern Bell Telephone Company v. AT&T Communications of the Southwest*, No. A-97-CA-132-SS, Motion for Summary Judgment of Southwestern Bell Telephone Company at 17 (W.D. Tex. filed Apr. 30, 1997) (*"SWB Motion"*).

[7] *US West Communications Inc. v. Thoms*, No. 4-97-CV-70082, US West's Opening Brief at 8-9 (N.D. Iowa filed May 12, 1997).

[8] *GTE Southwest, Inc. v. Wood*, No. M-97-078, Brief in Support of Motion for Summary Judgment at 16 & n.5 (S.D. Tex. filed Oct. 31, 1997) (*"GTE Motion"*).

[9] Respondent GTE, for example, contends that the Texas Commission's choice of a forward-looking TELRIC methodology "is a flat violation of the Act" because it does not guarantee GTE

The defense of state prerogatives advanced by the ILEC respondents in this Court as a reason to deny certiorari is thus unalloyed cynicism. They waive the banner of "decentralized decisionmaking" here, GTE Br. at 22, only because it suits their purpose of upholding the Eighth Circuit's decision to invalidate the procompetitive forward-looking cost methodology imposed by the FCC. In truth, however, the ILEC respondents agree with petitioners that § 251 should be read to impose a uniform federal pricing methodology. They disagree only over which branch of the federal government should impose it—the FCC in the exercise of its authority under § 251(d)(1) "to establish regulations to implement the requirements of [§ 251]," or the federal courts in the exercise of their authority under § 252(e)(6) to ensure that state arbitration decisions "meet the requirements of Section 251"—and over what that uniform pricing methodology should be.

The very fact that the ILEC respondents have advanced such arguments across the country in § 252(e)(6) litigation is a powerful reason why the petitions for certiorari should be granted. If, as petitioners contend here and as the ILECs have contended in federal district courts from Florida to California, the 1996 Act does not guarantee the States any significant discretion to make fundamental choices about pricing methodologies, then the essential premise of the Eighth Circuit's decision denying the FCC authority over pricing methodologies is invalid.

Furthermore, the existence of this nationwide ILEC campaign to impose a uniform federal embedded cost methodology refutes respondents' assertion that all methodological questions about price have been "settled" in the States. As a result of the Eighth Circuit's ruling, the pricing issue is anything but settled. Restoring the FCC's pricing rules would, however, go a long way toward set-

---

recovery of its embedded costs. *GTE Motion* at 38-39. Respondent SBC Communications Inc. is likewise arguing in Texas that the state commission's "TELRIC methodology similar to the FCC's . . . ignores the plain language of § 252(d)(1)." *SWB Motion* at 22-23.

tling the issue. Federal courts would have a single standard to apply in resolving these dozens of pending cases. And, because (as respondents stress) most States have adopted methodologies modeled on the FCC's vacated regulations, reimposing the FCC's pricing rules would not have the disruptive effect claimed by respondents. To the contrary, reimposing the FCC's pricing rules would vindicate most States' choice of pricing methodologies, and end the turmoil generated by the ILECs' nationwide campaign to invalidate forward-looking pricing. Moreover, as to the significant minority of states that have *not* in substance adopted forward-looking pricing methodologies, review is warranted to assure compliance with the substantive requirements of the Act.

2. Although the State respondents' defense of the Eighth Circuit is not so cynical, neither have they offered anything approaching the compelling defense of the ruling below that would be necessary to justify a denial of certiorari in a case of such nationwide importance. Petitioners have not ignored the Eighth Circuit's "plain meaning" ruling. To the contrary, the petitions for certiorari have all argued that the Eighth Circuit fundamentally misread § 251(d)(1)— which authorizes the FCC "to establish regulations to implement the requirements of [§ 251]"—in concluding that this provision granted no substantive rulemaking authority.

In this regard, respondents have not offered any convincing reason in the statutory text for reading § 251(d)(1) as solely a time limit. According to the State respondents, if Congress had wanted to grant rulemaking authority, it would have instead drafted "plainer" language stating "that the FCC rules extended to all regulations necessary to implement section 251." State Respondents' Brief In Opposition at 10. Such a nuanced view of the requirements of "plain meaning" can hardly justify denying the FCC authority to implement the pricing requirements of § 251. And respondents fail even to acknowledge the most obvious difficulty with their position. If

§ 251(d)(1) does not confer rulemaking authority on the FCC to implement any requirements of § 251, what is the source of the FCC's authority to issue the regulations respondents concede the FCC has authority to issue? None of the specific provisions to which respondents point provides anything like the express grant of rulemaking authority respondents claim is needed. At most these provisions presuppose the existence of rulemaking authority, and condition the FCC's exercise of that authority. That is doubtless why no respondent quotes any of these provisions to support the proposition that they unambiguously grant rulemaking authority.

Second, respondents insist that because Congress gave state commissions the authority to set "rates," by negative implication it could not have intended to have the FCC establish a national methodology to be used in setting those rates. RBOC Br. at 13. But respondents acknowledge that the Act in fact is silent on this point, *id.*, and they studiously avoid the legal point made in the petitions: when an issue of statutory construction turns on the implications to be drawn from legislative silence, *Chevron* requires that the agency's interpretation be given deference. This the Eighth Circuit plainly did not do.

Thus, the Eighth Circuit's ruling is so seriously open to question that it cannot stand as the last word on the scope of the FCC's authority to implement this "unusually important legislative enactment." *Reno v. American Civil Liberties Union*, 117 S. Ct. 2329, 2337 (1997).

CONCLUSION

The petition should be granted.

QUESTIONS PRESENTED

1. Whether the Eighth Circuit erred in holding that the Federal Communications Commission ("FCC") lacked jurisdiction under the Communications Act of 1934, 47 U.S.C. § 151 *et seq.* (as amended), to promulgate the "interconnection" pricing rules of its *First Report and Order* implementing the landmark Telecommunications Act of 1996.

2. Whether the court of appeals properly found that the FCC's "rebundling" rules for "unbundled network elements" under section 251(c)(3) of the Act, 47 U.S.C § 251(c)(3), are consistent with the plain meaning of the statute.

3. Whether in prescribing rule 51.315(b), 47 C.F.R. § 51.315(b), the FCC appropriately exercised its administrative authority by construing the nondiscrimination requirements of the Act to prohibit incumbent local telephone companies from disassembling already combined network elements before leasing them to competing local carriers.

LIST OF PARTIES AND AFFILIATES

The parties to the proceedings in the Eighth Circuit are listed in Pet. App. at 1a-4a, 73a-79a, 92a.

Pursuant to Supreme Court Rule 29.6, Respondent in Support of Petitioner states as follows:

The Competition Policy Institute ("CPI") is an independent, non-profit organization that advocates state and federal policies to promote competition in telecommunications and energy services in ways that benefit consumers. CPI is advised by a committee of consumer representatives from around the country and receives its funding primarily from new entrants in the market for local telephone service. CPI has no parent companies, subsidiaries, or affiliates.

BRIEF FOR RESPONDENT COMPETITION POLICY INSTITUTE IN SUPPORT OF PETITIONER

The Competition Policy Institute ("CPI") submits this brief in support of petitioners FCC, AT&T, MCI and ALTS for review of the judgment of the United States Court of Appeals for the Eighth Circuit in these cases.

OPINIONS BELOW

The principal opinion of the Court of Appeals for the Eighth Circuit in *Iowa Utilities Board v. FCC* (Pet. App. 1a-

67a),[1] as amended by the court's order on rehearing (Pet. App. 69a-72a), is reported at 120 F.3d 753. The Federal Communications Commission ("FCC") order reviewed by the Eighth Circuit—First Report and Order, *Implementation of the Local Competition Provisions in the Telecommunications Act of 1996* (excerpts of which are reproduced at Pet. App. 131a-337a)—is reported at 11 FCC Rcd. 15,499 (1996).

JURISDICTION

The judgment of the court of appeals in *Iowa Utilities Board* was entered on July 18, 1997. A subsequent order in that case, granting rehearing in part and denying rehearing part, was issued on October 14, 1997. Pet. App. 69a-72a. This Court has jurisdiction under 28 U.S.C. § 1254(1).

STATUTORY PROVISIONS INVOLVED

The most relevant portions of the Communications Act of 1934, as amended by the Telecommunications Act of 1996, appear at Pet. App. 93a-130a.

STATEMENT OF THE CASE

On February 8, 1996, the Telecommunications Act of 1996 ("the Act" or "the 1996 Act"), Pub. L. No. 104-104, 110 Stat. 56 (pertinent provisions codified at 47 U.S.C. §§ 251-76), was signed into law. This landmark legislation, the first comprehensive revision of the Communications Act since its enactment in 1934, was designed by Congress to "open[] *all* telecommunications markets to competition."

---

[1] References to "Pet. App." are to the Appendix filed by petitioner AT&T in No. 97-826.

H.R. Conf. Rep. No. 104-458, 104th Cong., 2d Sess. 1, 113 (Jan. 31, 1996) ("Conf. Rep.") (emphasis added). The Federal Communications Commission ("FCC") was directed to implement the critical local telephone competition provisions of the 1996 Act. 47 U.S.C. § 251(d)(1). The petitions before this Court seek review of the Eighth Circuit decisions vacating and upholding certain FCC regulations implementing the 1996 Act. *See Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, 11 FCC Rcd. 15,499 (1996) ("*First Report and Order*") (excerpts printed at Pet. App. 131a-337a); *Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, 11 FCC Rcd. 19,332 (1996) ("*Second Report and Order*") (excerpts printed at Pet. App. 338a-353a).

1. Prior to passage of the 1996 Act, little if any competition had developed in local telecommunications markets. As a result of the antitrust settlement in *United States v. AT&T*, 552 F. Supp. 131 (D.D.C. 1982), *aff'd mem. sub nom. Maryland v. United States*, 460 U.S. 1001 (1983), competition developed rapidly in the market for long-distance services. The *AT&T* settlement was founded on the theory that local telephone service was a "natural monopoly." Nearly fifteen years later, local telephone companies (referred to as "local exchange carriers") continue to retain monopolistic control over the provision of local telecommunications services. Consequently, telephone customers virtually never have a choice of providers for local phone service, preventing consumers from obtaining the many benefits attending competitive markets. These local monopolies are largely regulated by state public utility commissions and the FCC. Earlier this decade, some states sought to bring the benefits of competition to their local telecommunications markets, but these efforts were hindered

by the opposition of incumbent local exchange carriers and the lack of a national policy framework. *See Implementation of the Local Competition Provisions of the Telecommunications Act of 1996,* Notice of Proposed Rulemaking, CC Docket No. 96-98, FCC 96-182, 11 FCC Rcd. 14,171, ¶ 5 (April 19, 1996).

2. With the 1996 Act, Congress established a "national policy framework" designed to bring the benefits of competition to local telephone consumers throughout the country. Conf. Rep. at 1, 13. Congress amended Title II of the Communications Act of 1934, 47 U.S.C. § 151 *et seq*., to establish baseline federal policies to allow local competition to develop nationwide. In order to ensure consistency and uniformity in implementation of this national policy framework, the FCC was charged with ensuring that the Act's requirements were met. At the same time, in order to reflect the particularities of service at the local level, state commissions were also given a substantial role under the Act. This balanced regulatory approach ensures the development of a uniform national policy that rationally accounts for differing conditions at the local level.

There are three different means of competitive entry into local telecommunications services permitted under the 1996 Act. 47 U.S.C. § 251. Each mode of entry will attract a different kind of competitor, thus maximizing the likelihood of producing competitive local markets "as quickly as possible." H.R. Rep. No. 104-204, 104th Cong., 1st Sess. 89 (July 24, 1995) ("H. Rep."). First, competing local carriers can "interconnect" their own networks with the facilities of the existing, incumbent local carriers. Interconnection is especially important to facilities-based competitors, who are unlikely in the short run to have constructed local telephone networks connecting every single customer. Second, because local telecommunications

competition will not develop if new entrants are required to build their own facilities before initiating service, the Act entitles competitors to enter the local market by leasing pieces of the existing local exchange networks, referred to as "unbundled network elements" (switches, local telephone "loops," directory assistance, etc.), from incumbent carriers. Third, consistent with the FCC's traditional rules governing telecommunications services, other carriers are authorized to "resell" services of the incumbent local exchange carrier, thus allowing new competitors to offer a complete array of services immediately upon entry into the local telephone marketplace.

The principal provisions of the Act promoting local telephone competition are sections 251 and 252. Section 251 establishes specific obligations of incumbent local exchange carriers with respect to each mode of local telephone entry: interconnection, unbundled network elements and resale. Interconnection and "access to network elements on an unbundled basis" must both be offered to all competing telecommunications carriers on rates, terms and conditions that are "just, reasonable, and nondiscriminatory." 47 U.S.C. §§ 251(c)(2)(D), (c)(3). Incumbents are "required to offer for resale at wholesale rates any telecommunications service" sold to end user customers. *Id.* § 251(c)(4)(A). To enforce these obligations, the FCC is required to "establish regulations" implementing "the requirements of this section." *Id.* § 251(d)(1). And to facilitate the rapid movement of local markets towards competitive entry, Congress directed the FCC to "complete all actions necessary" to promulgate these implementing regulations "within 6 months." *Id.*

Section 252 sets forth the procedures that competitors and individual incumbent carriers must follow in order to meet the core requirements of section 251. 47 U.S.C. § 252.

Carriers must first negotiate an "interconnection agreement," and where negotiations fail to result in an expeditious agreement, state commissions are directed to arbitrate interconnection disputes. State commission resolution of issues presented for arbitration by the carriers must meet the requirements of section 251 and the FCC's implementing regulations. 47 U.S.C. § 252(c)(1). State commissions are charged with responsibility to "determine," consistent with the requirements of section 251, rates for interconnection, unbundled elements and resale. 47 U.S.C. §§ 252(d)(1), (d)(3). Section 252(d) provides that these rates are to be based on the "cost" of the service. In the event that a state commission does not fulfill its statutory role, the FCC is directed to assume these responsibilities. 47 U.S.C. § 252(e)(5). Once interconnection agreements are approved, they are subject to review by the federal courts, but not state courts, to determine if the requirements of sections 251 and 252 have been met. 47 U.S.C. §§ 252(e)(4), (e)(6).

Finally, in section 271 of the Act, Congress provided the former Bell Companies, called Regional Bell Operating Companies, with an incentive for opening their local markets. Once a regional company demonstrates that it has successfully complied with the requirements of section 271, the FCC is directed to permit the incumbent to provide long-distance services if it concludes (with the advice of the Department of Justice) that such long-distance entry is in the "public interest." 47 U.S.C. § 271. The FCC is directed to review such petitions to determine if they satisfy a specified fourteen-point checklist that references, *inter alia*, the requirements of sections 251 and 252. 47 U.S.C. § 271(c)(2)(B). In addition, the FCC must fill in where state commissions fail to carry out their statutory role and must ensure that the requirements of sections 251 and 252 are met

prior to approval of a Regional Bell Operating Company's petition to provide long-distance services.

Thus, Congress distributed jurisdictional responsibility for ensuring the development of local competition between both state and federal regulatory agencies. The FCC must implement section 251's requirements, the states must review, arbitrate and approve interconnection agreements, and the federal courts are charged with judicial review of those state-approved agreements.

3. On August 8, 1996, the FCC met the six-month statutory deadline to implement the requirements of section 251 and issued its *First Report and Order*. This order provided substantial detail and guidelines for implementation of the Act's requirements. Among the regulations enacted by the FCC was the establishment of pricing guidelines for setting rates for interconnection, unbundled network elements and resale. The FCC's rules defined the basic costing and pricing methodology to be used for determining whether rates for interconnection and unbundling were "just, reasonable, and nondiscriminatory" as required by sections 251(c)(2) and 251(c)(3). Likewise, the Commission established a methodology for determining resale rates under section 251(c)(4).

The FCC also defined the "network elements" that incumbent carriers are required to unbundle pursuant to section 251(c)(3). In establishing unbundling rules, the FCC implemented regulations to ensure that incumbent carriers allow competitors to combine, or "rebundle," network elements. Specifically, the FCC held that incumbent carriers must allow competitors to combine leased elements to provide finished telecommunications services. These regulations also prohibit discriminatory behavior by the incumbent in providing access to its network as required by section

251(c)(3). The FCC ruled that in order to prevent discrimination and anticompetitive conduct by incumbent carriers, incumbents may not break apart already combined network elements before leasing them to competing local carriers. 47 C.F.R. § 51.315(b). This ensures that incumbents cannot retard competitive local entry by imposing on their competitors the cost and delay of integrating network elements that are already combined in the incumbent's own telecommunications network.

4. Petitions for judicial review of the FCC's *First Report and Order* were filed by incumbent carriers in several federal courts and consolidated and assigned by lottery to the United States Court of Appeals for the Eighth Circuit. *See* 28 U.S.C. § 2112(a)(3). These petitions challenged a number of rules, including the FCC's pricing rules and the agency's requirements with respect to rebundling and disassembly of unbundled network elements.

On July 18, 1997, the Eighth Circuit issued its decision. Without reaching the merits of the FCC's pricing rules, the court of appeals found that these rules exceeded the agency's jurisdiction on the ground that section 252 gives state commissions exclusive authority to set prices for interconnection, unbundled elements and resale. Pet. App. 11a-12a. On rehearing, the Eighth Circuit invalidated the FCC's rule 51.315(b), which it had initially left intact, holding that the Act entitles an incumbent carrier to disconnect previously combined elements. *Id.*

5. Following the Eighth Circuit's decisions, petitions for certiorari were filed by numerous parties seeking review of the judgment. Cross Petitions were filed by several opposing carriers requesting review of certain other aspects of the Eighth Circuit's ruling. This Court accepted certiorari

and consolidated all the petitions and cross petitions seeking review of the court of appeals' judgment.

SUMMARY OF THE ARGUMENT

In enacting the Telecommunications Act of 1996, Congress affirmatively sought to alter the *status quo* by establishing a "national policy framework" to accelerate the development of local telephone competition. The new regulatory scheme fashioned by Congress expressly recognizes the unique character of interconnection, unbundling and resale, and thus eschews reliance on the interstate/intrastate jurisdictional allocation traditionally used for regulation of telecommunications services.

Because the local telephone network encompasses both intrastate and interstate components that are not within the exclusive jurisdiction *either* of the FCC or state public utility commissions, the 1996 Act contemplates shared federal/state responsibility for implementing measures to open local telephone markets to competition. Thus, section 251 directs the FCC to "establish regulations" implementing the requirements for interconnection, including pricing. Section 252, on the other hand, directs state commissions to arbitrate interconnection agreements and to "determine" the prices for interconnection, unbundled network elements and resale based on the "cost" of the service. This shared responsibility over pricing is fully consistent with Congress's desire for a nationwide policy to promote competition at the local level "as quickly as possible."

The best way the local telecommunications competition envisioned by Congress can occur on a national basis is with a single definition of "cost" that is implemented uniformly for individual states and local exchange carriers nationwide. The states continue to have a substantial role in

furthering and maintaining the national policy of local competition, circumscribed by the Act's requirements and the FCC's implementing regulations.

The Eighth Circuit's decision to grant complete pricing authority to the states is based on several errors: (1) it ignores the explicit language and structure of the Act giving the FCC authority over rates; (2) it incorrectly assumes that interconnection, unbundled network elements and resale are solely "intrastate" services; (3) it improperly substitutes the Eighth Circuit's interpretation of the 1996 Act for that of the FCC, thereby ignoring this Court's rulings on deference to administrative agencies; and (4) it incorrectly applies section 2(b) of the Communications Act, 47 U.S.C. § 152(b)(1), in a manner that conflicts with the authority affirmatively granted the FCC under section 251. Because section 251 authorizes the FCC to "establish regulations" for interconnection, unbundled network elements and resale—including definitions of "just and reasonable" rates under sections 251(c)(2)-(3) and wholesale rates under section 251(c)(4)—neither section 252 nor section 2(b) is a jurisdictional barrier to promulgation by the FCC of rules defining interconnection "cost" for purposes of state "determination" of interconnection rates in arbitrations.

The Eighth Circuit properly concluded that the definitions of unbundled network elements, and the FCC's rule allowing competitors to "rebundle" network elements, fall within the Commission's statutory jurisdiction in light of the clear statutory jurisdiction for the agency to promulgate unbundling rules. However, the court of appeals erred in overturning on rehearing the provisions of the *First Report and Order* prohibiting incumbents from disassembling already combined unbundled network elements. The FCC's rule is a reasonable interpretation of the statutory language that is entitled to deference by the appellate court.

ARGUMENT

I. THE COURT OF APPEALS' DECISION IS INCONSISTENT WITH THE 1996 ACT'S MODEL OF SHARED JURISDICTIONAL AUTHORITY BETWEEN THE FCC AND STATES FOR INTERCONNECTION PRICING

The 1996 Act creates a model of regulatory jurisdiction that is specially fashioned to meet the congressional goal of a rapid transition to competitive local telecommunications under a national policy framework. Section 251 requires the FCC to "establish regulations" to "implement[ ]" the provisions governing interconnection, unbundling and resale, including the requirement that rates be "just, reasonable, and nondiscriminatory." 47 U.S.C. §§ 251(c)(2), (c)(3), (d)(1). Section 252 provides that state commissions are to "determin[e]" interconnection prices, based on the "cost" of the respective service, in resolving interconnection arbitrations. 47 U.S.C. §§ 252(d)(1), (d)(3). Congress clearly intended that both the FCC and the states would have authority over pricing issues. By allowing section 252 to supersede section 251, the Eighth Circuit rendered meaningless the affirmative "rates" provisions of the latter. The court of appeals' judgment therefore accords exclusive authority over pricing to the states in a manner that cannot be squared either with the language and structure of the Act or with the congressional objective of establishing a national policy framework to promote local telephone competition.

A. Congress Established a Unique Regulatory Structure and a National Policy Framework to Open Local Telephone Markets to Competition

In overturning key facets of the FCC's *First Report and Order*, the Eighth Circuit did not reach the substantive

merits of the FCC's pricing rules, but rather based its decision on the erroneous conclusion that the FCC lacked jurisdiction to promulgate any pricing rules. Specifically, the court held that the traditional interstate/intrastate jurisdictional allocation originally enacted in 1934, *see Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355 (1986), also applies to sections 251 and 252 of the 1996 Act. Pet. App. 22a-23a. Consequently, the Eighth Circuit failed to recognize that the language, structure and purpose of the 1996 Act create new shared federal/state regulatory responsibilities for opening local telephone markets to competition.

This dual regulatory approach is readily apparent when the statutory provisions of the Act are read as a whole. Yet, rather than discern the congressional scheme, the Eighth Circuit simply parsed certain statutory sections in isolation. The resulting decision is not only contrary to settled principles of statutory interpretation and judicial deference, but undermines the overall scheme and function of the Act.

There is no question that Congress intended to establish a new "pro-competitive, de-regulatory *national* policy framework" for the communications industry. Conf. Rep. at 1, 113 (emphasis added). Nor is there any disagreement that the central goal of the Act was to create "competition as quickly as possible." H. Rep. at 89. Thus, the Act's "major components * * * were designed to promote competition in the local telephone service market." *Reno v. ACLU*, 117 S. Ct. 2329, 2337-38 (1997). In an effort to jump start competition, Congress directed federal and state regulators to work together to implement the provisions governing access by competitors to the local telephone network. In other words, the "national policy framework" of the Act contemplates shared federal and state responsibility

for introducing competition through interconnection, unbundling and resale.

As discussed more fully in Section I.B, Congress's intent to create a shared system of federal and state responsibility for opening local markets to competition is evident when the local competition provisions of the Act are viewed as a whole.

> When interpreting a statute, the court will not look merely to a particular clause in which general words may be used, but will take in connection with it the whole statute . . . and the objects and policy of the law, as indicated by its various provisions, and give to it such a construction as will carry into execution the will of the legislature. *Kokoszka v. Bedford*, 417 U.S. 642, 650 (1974).

The Eighth Circuit violated this well-settled principle of statutory construction by viewing the language of section 252(d) (states "determine" interconnection rates) in isolation from the balance of the 1996 Act.

As directed by the Act, the FCC "establishes regulations" necessary to implement local competition under section 251. 47 U.S.C. § 251(d)(1). Section 251 includes provisions requiring that rates be "just, reasonable, and nondiscriminatory" 47 U.S.C. §§ 251(c)(2), (c)(3). The FCC then hands off responsibility to the states, pursuant to section 252, to examine and "determin[e]" the specific rates, terms and conditions actually incorporated in individual interconnection agreements. 47 U.S.C. § 252(d). State commissions thus implement both rate and non-rate provisions of Act, in accordance with section 251 and the FCC's regulations, in the context of carrier-specific interconnection

arbitrations. Requiring compliance with FCC rules is essential to maintain a national policy framework. This dual regulatory approach allows the FCC to establish uniform national rules that ensure compliance with section 251's requirements, while permitting states to set specific prices that take into account the particular "costs" of each local area and incumbent local carrier and to approve the actual interconnection agreements.

Consequently, the Eighth Circuit's insistence on maintaining traditional intrastate/interstate jurisdictional roles thwarts the congressional goal of opening local markets to competition in a nationally consistent fashion. Granting exclusive interconnection pricing authority to the states on grounds that unbundling and interconnection are "fundamentally intrastate," Pet. App. 22a-23a, as the Eighth Circuit reasoned, in fact strips the FCC of any ability to ensure consistent, uniform application of section 251's requirements in the hundreds of interconnection agreement arbitrations supervised by state commissions. Under the Eighth Circuit's decision, the "national policy framework" and uniformity sought by Congress can only be achieved through Supreme Court review of federal section 252(e)(6) actions challenging state arbitration proceedings.[2] This highly unusual approach to statutory interpretation—in essence delegating to state regulatory commissions the ability to interpret a federal statute—cannot be assumed in the absence of some affirmative manifestation by Congress. The law is clear that state commissions are due no deference when interpreting a

---

[2] *See* 47 U.S.C. § 252(e)(6)("In any case in which a State commission makes a determination under this section, any party aggrieved by such determination may bring an action in an appropriate federal district court to determine whether the agreement or statement meets the requirements of section 251 and this section.").

federal statute. *E.g., Orthopaedic Hosp. v. Belshe,* 103 F.3d 1491, 1495-96 (9th Cir. 1996).

B. The Local Competition Provisions of the Act Contemplate Shared Federal/State Authority

1. Sections 251 and 252 Create a "New Model" of Jurisdictional Authority for Interconnection

Sections 251 and 252, read together, clearly establish that Congress sought to eschew the traditional intra-state/interstate jurisdictional regulatory scheme in favor of a new, shared jurisdictional model that would more rapidly permit the development of local competition on a consistent national basis. Indeed, the first line of the legislative history of section 251 makes explicit reference to a "new model" of interconnection. Conf. Rep. at 121. Consequently, and deliberately, neither section 251 nor section 252 ever refers to unbundling, interconnection or resale as either "intrastate" or "interstate," the traditional line of jurisdictional demarcation under the original 1934 Act. *See Smith v. Illinois,* 282 U.S. 133 (1930); 47 U.S.C. § 152(b)(1).

Congress chose this "new model" because the unique character of interconnection, unbundled network elements and resale defies reliance on traditional interstate/intrastate jurisdictional allocation. The same copper telephone "loops," whether made available via interconnection, unbundling or resale, will be used by competing carriers to provide both intrastate and interstate telecommunications services. Nothing in the Act limits their use; nothing requires carriers to purchase some unbundled network elements for interstate services and another set of unbundled elements for intrastate services. Instead of dividing telephone facilities and regulation along intrastate and

interstate lines, as under the 1934 Act (which limited the FCC to regulating "interstate" communications), sections 251 and 252 establish joint jurisdiction over unbundling, interconnection and resale because those services and facilities will be used on an intrastate and interstate basis.

The omission of any reference to "intrastate" or "interstate" interconnection services is significant. Under sections 251 and 252, both state and federal regulators undertake responsibilities that they could not have performed under the traditional 1934 Act regime. Thus, for example, the FCC establishes rules to implement unbundling, interconnection and resale for incumbent local exchange carriers, regardless of whether these services or facilities are used for intrastate or interstate purposes. 47 U.S.C. § 251(d). Likewise, states must approve interconnection agreements that apply to provision of services for *both* intrastate and interstate communications, 47 U.S.C. § 252(e), and must "determine" prices for both intrastate and interstate use of interconnection, unbundled network elements, and resale.

The Eighth Circuit held that state commissions enjoy exclusive jurisdiction over prices for unbundled network elements, interconnection and resale. In the court of appeals' view, the FCC lacks jurisdiction to set pricing because it assumed that interconnection is "fundamentally intrastate." Pet. App. 22a. Yet the court failed to examine the *consequences* of its assumption, namely that pricing under the Act, if left solely to state commissions, gives state commissions jurisdiction over *interstate* communications services. There is no authority anywhere in the Act or its legislative history for the proposition that states can regulate interstate services. Indeed, the Communications Act elsewhere grants the FCC exclusive jurisdiction to regulate interstate telecommunications services. And where interstate and intrastate services are inextricably mixed, as here, the courts

have long permitted FCC *preemption* of state regulatory authority. *See North Carolina Util. Comm'n v. FCC*, 552 F.2d 1036, 1045 (4th Cir. 1977)("*NCUC II*"); *accord Illinois Bell Tel. Co. v FCC*, 883 F.2d 104, 116 (D.C. Cir. 1989); *Computer & Communications Indus. Ass'n v. FCC*, 693 F.2d 198, 215-16 (D.C. Cir. 1982); *National Ass'n of Reg. Util. Comm'rs v. FCC*, 737 F.2d 1095, 1114-15 (D.C. Cir. 1984), *cert. denied*, 469 U.S. 1227 (1985). *See, e.g., North Carolina Util. Comm'n v. FCC*, 537 F.2d 787, 791-94 (4th Cir. 1976); *National Ass'n of Reg. Util. Comm'rs v. FCC*, 880 F.2d 422, 431 (D.C. Cir. 1989).

Congress's omission of any "intrastate" or "interstate" language in sections 251 and 252 was deliberate. Other provisions of the Act demonstrate that where Congress wanted to maintain the interstate and intrastate jurisdictional scheme, it did so. For instance, in the Act's provisions concerning pay-per-call services, *see* 47 U.S.C. § 228, and payphone compensation, *see* 47 U.S.C. § 276, Congress explicitly stated that the provisions would apply to all "interstate and intrastate" calls. Likewise in section 254, Congress explicitly maintained the intrastate/interstate distinction for universal service, and fashioned new regulatory rules for determinations concerning those jurisdictional parameters. *See* 47 U.S.C. § 254(f).

These differences demonstrate unequivocally that Congress could and did maintain the distinction between interstate and intrastate services where it intended such distinctions to be preserved. Congress's failure to use such traditional language in the 1996 Act's central provisions on interconnection confirms Congress's expressed intent to fashion a "new model" of shared regulatory jurisdiction. *See* Conf. Rep. at 121. The court of appeals' failure to consider the language and structure of sections 251 and 252, in context, is thus the fatal flaw in its holding that section

252(d) accords exclusive interconnection pricing to state commissions.

2. The Eighth Circuit Improperly Read Section 252's Pricing Language in Isolation from the Rest of the Statute

The court of appeals erred in failing to construe section 252's pricing language in harmony with the rest of the statute. *See Kokoszka*, 417 U.S. at 650. Looking solely at section 252, the Eighth Circuit reasoned that

> subsection 252(d) refers exclusively to the determinations by state commissions of the just and reasonable rates, and it provides statutory standards for the state commissions to follow when setting the rates, *thus negating any need for additional FCC standards or guidelines.* Pet. App. 14a (emphasis added).

Accordingly, the court held that the FCC's pricing rules supplant state commissions' ability to "establish" or "determine" rates as directed in section 252(d). Pet. App. 21a n.19. This logic is incorrect.

The Eighth Circuit's conclusion "that the Act *plainly* grants the state commissions, not the FCC, the authority to determine the rates involved in the implementation of the local competition provisions of the Act," Pet. App. 14a (emphasis added), is wrong. The court of appeals' opinion fails to address the critical issue of whether the FCC's rules prevent the state commissions from "determining" or "establishing" rates under section 252(d). The fact that "the Act directly and straightforwardly assigns to the states the authority to set prices regarding the local competition provisions of the Act in subsection 252(c)(2) and 252(d),"

Pet. App. 17a, in no way precludes the FCC from establishing a uniform federal pricing *methodology*.

The methodology set out in the FCC's *First Report and Order* effectively implements the requirements of section 251 that access to interconnection and unbundled network elements be provided "on *rates*, terms and conditions that are just reasonable, and nondiscriminatory, in accordance with the terms and conditions of the agreement *and the requirements of this section and section 252*," 47 U.S.C. §§ 251(c)(2)(D), (c)(3) (emphasis added). By defining "based on cost," the FCC's rules that ensure that states make rate determinations based on a single, uniform costing methodology. *See, e.g., First Report and Order* ¶¶ 618, 625. This methodology does *not* "determine" or "establish" the actual rates, *id.* ¶ 618, but rather leaves the rate-making function to states, which are best positioned to make such fact- and record-dependent determinations.

Interpreting the 1996 Act to support this sort of bifurcated pricing jurisdiction is consistent with the common usage of the language employed by Congress. Under section 251, the FCC is required to "implement" the provisions of the Act. In contrast, under section 252, state commissions must "establish" or "determine" rates for interconnection and unbundled network elements. *First Report and Order* ¶ 618. The Eighth Circuit's reading of the statute equates "determine" with "implement," implying that Congress wanted states to define the pricing standards, as well as set actual interconnection prices, under section 252. Yet this approach turns the common meaning of the statutory language on its head.[3]

---

[3] This Court has repeatedly looked to dictionary definitions where statutory ambiguities require it to discern Congress's intent. *See,*

Dictionaries define these terms very differently. *Implement* is defined as "[t]o carry into effect; fulfill; accomplish . . . [t]o provide what is needed for; supplement." FUNK & WAGNALLS STANDARD DICTIONARY 635 (1978). *Determine* is defined as "to fix conclusively or authoritatively" or "to settle or decide by choice of alternatives or possibilities" or "to fix the form, position or character of beforehand" or "to bring about as a result" or "to find out or come to a decision about by investigation, reasoning, or calculation." WEBSTER'S NINTH NEW COLLEGIATE DICTIONARY 346 (1984); *accord*, FUNK & WAGNALLS STANDARD DICTIONARY 349 (1978)("to settle or decide, as an argument, question or debate. . . . to ascertain or fix, as after thought or observation. . . . to cause to reach a decision. . . . to regulate; fix or decide causally."). *Establish* is defined as "to settle or fix firmly; make stable or permanent." *Id.* at 434. Thus, the terms "determine" and "establish" both connote the setting or fixing of particular rates, or selecting actual values.[4] By authorizing the FCC to "implement" the Act's pricing provisions, Congress must therefore have intended that the agency "supplement" the bare-bones language of the

---

e.g., *United States v. LaBonte*, 117 S. Ct. 1673 (1997)(Thomas, J.) (defining "maximum" sentencing guidelines); *Allied-Bruce Terminix Companies v. Dobson*, 513 U.S. 265 (1995)(Breyer, J.)(defining what "involves" and "affects" commerce); *Hubbard v. U.S.*, 514 U.S. 695 (1995)(Stevens, J.)(defining what "shows" congressional intent); *Asgrow Seed Co. v. Winterboer*, 513 U.S. 179 (1995)(Scalia, J.)(definition of "marketing").

[4] Because it permits states to decide what the statutory "cost" standard for interconnection prices means in the context of arbitration proceedings, the Eighth Circuit's interpretation essentially equates "determine" with "define." However, *define* is a much broader term, meaning "to determine or identify the essential qualities or meaning of" or "to discover or set forth the meaning of" or "to make distinct, clear or detailed in outline." WEBSTER'S NINTH NEW COLLEGIATE DICTIONARY 334 (1984); *accord* FUNK & WAGNALLS STANDARD DICTIONARY 336 (1978 ("to state the meaning of (a word or phase)").

Act's interconnection pricing standards by "providing what is needed" for states to "determine" prices, namely defining the "cost" standard of section 252(d).

This bifurcated approach to pricing also reflects Congress's desire to promote some degree of national uniformity. The statutory "standards" referred to by the Eighth Circuit are not self-executing; without regulations interpreting and defining the statutory language, the pricing standards alone are imprecise. The term "based on cost" in section 252(d)—the pricing standard for interconnection and unbundled network elements—is subject to widely disparate, and inconsistent, interpretations. In telecommunications regulation, "cost" has historically assumed many meanings, including basic methodological differences such as whether incumbent local exchange carriers should recover historical, embedded costs or forward-looking costs, and under what methodology such costs should be measured.[5] Therefore, contrary to the court of appeals' reasoning, the language of section 252(d) does not "negate" the need for FCC rules, but instead shows that without guidelines on such fundamental methodological concerns, there can be no hope of a nationally uniform framework for local telephone competition.

3. The Structure of the 1996 Act Confirms Congress's New Model of Shared Federal/State Jurisdiction

The structure of sections 251 and 252 reveals a strong and significant interrelationship. Throughout section 251,

---

[5] James C. Bonbright et al., PRINCIPLES OF PUBLIC UTILITY RATES 109 (1988)("'Cost' like 'value' is a word of many meanings, with the result that people who disagree, not just on minor details but on major principles of ratemaking policy, all may subscribe to some version of the principle of service at cost.")

there are cross-references to section 252, *see, e.g.*, 47 U.S.C. §§ 251(c)(1), (c)(2)(D), (c)(3), and section 252 likewise cross-references the requirements in section 251. *See, e.g.*, 47 U.S.C. §§ 252(a)(1), (c)(1), (d)(1)-(3), (e)(2)(B), (f). For instance, unbundled network elements must be priced at "just, reasonable, and nondiscriminatory rates" that are "in accordance with . . . the requirements of section 252." 47 U.S.C. § 251(c)(3). It is clear from these cross-references that Congress intended both federal and state commissions to have a role under the local competition provisions of the Act.

Consequently, even though the mandate for states to "determine" interconnection prices in section 252(d) does not require such prices to be set "in accordance with" section 251, Pet. App. 13a-14a, it does provide that states are to "determin[e]" prices "for purposes of" section 251's "just, reasonable, and nondiscriminatory" rates requirement. 47 U.S.C. § 252(d).[6] Furthermore, section 252(c)(1) requires that states "ensure" that their interconnection arbitration decisions "meet the requirements of section 251, including the regulations prescribed by the Commission." 47 U.S.C. §

---

[6] The Eighth Circuit found it significant that section 252(d) does not contain any reference to the FCC's section 251 rules. Pet App. 13a. Yet section 252(d) itself is constrained by section 252(c), which *does* contain explicit references to both section 251 and the FCC's rules. A state does not always determine the prices; if the parties to a negotiation agree on prices, the state reviews the agreement under section 252(e)(2)(A). 47 U.S.C. § 252(e)(2)(A). States only step forward to "determine" prices if the parties cannot agree and ask the state to arbitrate. Section 252(c) states that "in resolving by arbitration . . . *any* open issues . . . a State commission shall (1) ensure that such resolution and conditions meet the requirement of section 251, including the regulations prescribed by the Commission." 47 U.S.C. § 252(c)(emphasis added). "[A]ny open issues" includes pricing issues. *See* section 252(c)(2). Thus, the cross-reference in section 252(c) to the FCC's rules also applies to state determinations of "cost" under section 252(d), and state cost decisions must, accordingly, be consistent with the FCC's section 251 rules.

252(c)(1). In light of these express interrelationships between sections 251 and 252, the Court cannot infer that Congress intended to create a pricing-specific exception to the requirement that state implementation of decisions must comply with the requirements of section 251 and the FCC's rules. While Congress could have been more expansive in delineating the federal and state regulatory roles, the evident interrelationship between the two sections establishes Congress's intent that *both* federal and state agencies participate in pricing decisions, regardless of "interstate" or "intrastate" use of interconnection, unbundling, and resale.

Interpreting the statutory language of sections 251 and 252 to establish shared jurisdiction over opening local telephone markets to competition is consistent with the Congressional purpose of establishing a national communications policy framework for local competition. *See infra,* Section I.B. Competitors need to know what the rules are before rolling out service; states have experience holding hearings and conducting cost studies for telecommunications services. Thus, by permitting the FCC to set generic pricing requirements for "just and reasonable rates," while authorizing states to "determine" prices in specific arbitration proceedings, Congress efficiently allocated work to the agency best equipped to implement the 1996 Act most expeditiously.

II. THE EIGHTH CIRCUIT WAS REQUIRED TO DEFER TO THE FCC'S INTERPRETATION OF PRICING JURISDICTION UNDER THE 1996 ACT

A. The Eighth Circuit Erred in Concluding That the 1996 Act "Plainly" Leaves All Pricing Jurisdiction to the States

The 1996 Act does not expressly state precisely how jurisdiction over its pricing provisions for interconnection and unbundled elements will be allocated. The Eighth Circuit acknowledged that it must defer to agency interpretations "if they are consistent with the plain meaning of a statute or are reasonable constructions of ambiguous statutes," Pet. App. 8a (citing *Chevron USA Inc. v. Natural Resources Defense Council*, 467 U.S. 837, 842-45 (1984)), but incorrectly concluded that the grant of section 251 rulemaking authority "plainly" did not extend to pricing methodologies for interconnection. Pet App. 14a. The Eighth Circuit likewise improperly found that section 251's rulemaking provisions are solely time constraints, not substantive grants of regulatory authority. Pet. App. 10a. Based on this erroneous substitution of its own statutory interpretation for that of the agency, the Eighth Circuit concluded that "the FCC exceeded its jurisdiction in promulgating the price rules regarding local telephone service." Pet. App. 9a-10a.

1. The Act's Language is Ambiguous with Regard to Jurisdiction Over Pricing

While the 1996 Act clearly sets forth that both the FCC and state commissions have a role over pricing, the Act does not plainly provide how this joint responsibility shall be implemented. Section 251 indicates an FCC role, requiring the FCC to "complete all actions necessary to establish

regulations to implement the requirements" of section 251, including the "just and reasonable rates" requirements in sections 251(c)(2) and (c)(3). 47 U.S.C. § 251(d)(1). Section 252 indicates a state role, directing states to "establish any rates for interconnection, services, or network elements." 47 U.S.C. § 252(c). But neither section provides that either the FCC or the states have *exclusive* jurisdiction for setting interconnection prices. Thus, in the absence of express language, the Court must examine the language, structure and purpose of Act to discern congressional intent, *Kokoszka*, 417 U.S. at 650, and should defer to the agency's interpretations if they are a "reasonable construction" of the statute. *Chevron*, 467 U.S. at 842-45.

2. The FCC Reasonably Interpreted the Ambiguous Statute

It is a "dominant, well-settled principle of federal law" for courts to grant "[j]udicial deference to reasonable interpretations by an agency of a statute that it administers." *National RR Passenger Corp. v. Boston & Maine Corp.*, 503 U.S. 407, 417 (1992); *see Chevron*, 467 U.S. at 842-43. The FCC's promulgation of interconnection pricing rules is a fair reading of ambiguous statutory language. Pursuant to section 251(d)(1), the FCC was directed by Congress to "establish regulations to implement the requirements" of section 251. 47 U.S.C. § 251(d)(1). Congress did not limit the FCC's implementation authority only to particular enumerated subsections, as it could and would have if it intended the result adopted by the Eighth Circuit.

Accordingly, the grant of FCC rulemaking authority requires the FCC to promulgate regulations implementing *all* of section 251's requirements. These regulations necessarily include rules for setting "just and reasonable" rates for interconnection, unbundled network elements and resale that,

in light of the additional "cost" standard of section 252(2), meet the requirements of *both* sections 251 and 252. Indeed, section 251(c)(2)(D) states that interconnection prices must be "just, reasonable, and nondiscriminatory in accordance with . . . *the requirements of this section and section 252.*" 47 U.S.C. § 251(c)(2)(D)(emphasis added); 47 U.S.C. § 251(c)(3)(same). It would therefore have been foolhardy, and perhaps unlawful, for the FCC to define a methodology for "just and reasonable" interconnection rates without acting in harmony with the "based on cost" standard of section 252.

Section 251(d)(1), like a "necessary and proper" clause, is an affirmative grant of authority to develop rules for all of section 251, including "rates, terms, and conditions." *See* 47 U.S.C. §§ 251(c)(2), (c)(3). Contrary to the court of appeals' reasoning, the fact that the Act does not specifically state that the Commission is authorized to promulgate pricing rules, *see* Pet. App. 11a, is irrelevant; section 251 gives express authority to the FCC to promulgate *all rules* necessary to "implement" its terms consistent with section 252. This is precisely what the FCC did in setting pricing guidelines in the *First Report and Order.*

The FCC's interpretation is reasonable because Congress could not have intended that the agency be allowed to define "just and reasonable" interconnection rates in a way that conflicts with the section 252 standard that states must apply in arbitrations. Indeed, the FCC's guidelines ensure that the Act is implemented such that congressional intention, policy and objectives are fulfilled. *See Kokoszka,* 417 U.S. at 650. Had the FCC failed to refer to section 252 that could, and likely would, have led to inconsistent results. *California v. FCC*, 567 F.2d 84, 86 (D.C. Cir. 1977)(federal policy must supersede individual state policies where inconsistent state policies are likely to result.) The FCC's pricing guidelines are the only way to ensure this congressional

intent is realized. Thus, the Eighth Circuit's conclusion that "nowhere in section 251 is the FCC authorized specifically to issue rules governing the rates for interconnection, unbundled access, and resale, and the transport and termination of telecommunications traffic," Pet. App. 12a, fails to comport not only with Congress's directives to the agency in section 251, but also with the clear and uncontested congressional intent to create a uniform national policy framework for opening local markets to competition.

3. The Eighth Circuit Erred in Concluding that Section 251 Creates Only a Timing Constraint

The Eighth Circuit's jurisdictional analysis rests on a faulty reading of a key portion of section 251. The court of appeals concluded "that subsection 251(d)(1) operates primarily as a time constraint, directing the Commission to complete expeditiously its rulemaking regarding only the areas in section 251 where Congress expressly called for the FCC's involvement." Pet. App. 12a.

This conclusion is wrong for two reasons. First, section 251(d)(1) requires the FCC "within 6 months after the enactment of the [1996 Act]," to "complete all actions necessary to establish regulations to implement the requirements" of section 251, including the pricing requirements of section 251(c). 47 U.S.C. § 252(d)(1). Nothing in this language limits the provision to the procedural issue of timing alone. By its terms, section 251(d)(1) is both a six-month deadline *and* a substantive grant of authority to implement the provisions of section 251.

Second, even if section 251(d)(1) can be read as "primarily" a procedural clause, it is sufficiently ambiguous

that the Eighth Circuit should have deferred to the agency's conclusion that section 251(d)(1) is an affirmative grant of rulemaking authority.[7] *Chevron*, 467 U.S. at 843-45. The court of appeals did not (and could not) conclude that the rulemaking provision is only a timing constraint, because without the directive in section 251(d)(1), there would have been no agency obligation to promulgate regulations for the Act's non-price provisions (many of which the Eighth Circuit upheld). Furthermore, the six-month limitation can just as easily be seen as an implementation of the congressional goal to introduce local telephone competition "as quickly as possible," by requiring the FCC to rapidly fashion a "national policy framework" fleshing out the statutory language, as an implicit constraint on federal jurisdiction. Finally, in section 251, Congress *did* "expressly call[] for the Commission's involvement" in interconnection pricing. The Eighth Circuit's flawed "plain meaning" analysis begs the real question of the scope and extent of that involvement.

B. Congress Did Not Alter the Agency's General Authority To Implement Its Enabling Statute

The FCC always has enjoyed general rulemaking authority to issue rules implementing the Communications Act of 1934. Under section 201(b) of the Communications Act, the FCC has authority to "prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this Act." 47 U.S.C. § 201(b); *see*

---

[7] *Chevron* deference extends to agency interpretations of jurisdictional provisions. *See EEOC v. Commercial Office Products Co.*, 486 U.S. 107, 115-16 (1988) (upholding EEOC interpretation of the jurisdictional provisions in § 706 of the Civil Rights Act of 1964 under *Chevron* standard of review).

also 47 U.S.C. §§ 154(I), 303(r); *National Broadcasting Co. v. United States,* 319 U.S. 190, 219 (1943). This authority extends to *all* of "the provisions of" the Act. 47 U.S.C. § 201(b). Thus, the Eighth Circuit's decision marks the first time that a court has held that, despite section 201(b), the FCC lacks authority to implement key substantive provisions of the federal telecommunications law.

Rather than create a wholly separate statute when it created the local competition provisions of the 1996 Act, Congress chose to amend Title II of the Communications Act. Congress could have, but did not, limit the Commission's authority under section 201(b) to implement the provisions of the Act. Thus, the provisions of the 1996 Act, as part of Title II, fall squarely within the Commission's section 201(b) rulemaking authority, giving the FCC independent authority to implement the provisions of sections 251 and 252 the Act.

Furthermore, the Eighth Circuit's interpretation would lead to administrative inefficiency. Under the court of appeals' view, the FCC cannot adopt rules to enforce a provision of the Communications Act unless the provision specifically authorizes the agency to engage in rulemaking. A section of the Communications Act with no reference to FCC rules would be enforceable only by the courts. This result, which essentially bypasses the FCC, ignores the basic function of administrative agencies under our constitutional system of separation of powers. The untoward consequence of the Eighth Circuit's reasoning is thus to throw into question hundreds of agency enabling statutes where Congress has granted general, but not section-specific, rulemaking powers, and to encourage Congress to "micro-manage" legislation that is best left to administrative agencies to interpret and apply in light of rapidly changing

real-world considerations the legislature cannot be expected to know or predict.

C. The Court of Appeals Incorrectly Applied the "Fence" of Section 2(b) to Overturn Congress's Intent

1. The Eighth Circuit Erred in Concluding That the Services at Issue Were "Intrastate" Under Section 2(b)

Section 2(b) of the Communications Act provides that "nothing in this [Act] shall be construed to apply or give the Commission jurisdiction with respect to * * * charges, classifications, practices, services, facilities or regulations for or in connection with intrastate communication service." 47 U.S.C. § 152(b). The Eighth Circuit concluded that this provision "is hog tight, horse high and bull strong," and bars the FCC from "intruding on the states' intrastate turf." Pet. App. 23a. This conclusion is erroneous.

Section 2(b)'s limitation of FCC action applies only to "intrastate" services. *Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 335, 373 (1986). Ignoring the considerable federal caselaw on this point, the Eighth Circuit assumed, without record or legislative history support, that interconnection and unbundled elements are intrastate services and facilities subject to section 2(b). Pet. App. 15a. This assertion is untrue, since "[t]he same loop that connects a telephone subscriber to the local exchange necessarily connects that subscriber into the interstate network as well." *NARUC v. FCC*, 737 F.2d at 1113.[8] The court of appeals'

---

[8] *Accord Public Serv. Comm'n of Maryland v. FCC*, 909 F.2d 1510, 1515 (D.C. Cir. 1990); *Public Utils. Comm'n of Texas v. FCC*, 886 F.2d 1325, 1333 (D.C. Cir. 1989); *Illinois Bell Tel. Co. v. FCC*, 883 F.2d

judgment must fail because its entire analysis is based on the faulty premise that interconnection is a traditional "local" telephone service subject to state public utility commission jurisdiction under *Smith v. Illinois*, 282 U.S. 133, 148 (1930).

The Eighth Circuit simply *assumes*, with pure *ipse dixit* reasoning, that because of the word "local" (as in "local exchange carriers"), the FCC's pricing rules must apply only to intrastate services.

> [T]he prices that incumbent local exchange carriers may charge their new competitors for interconnection, unbundled access, and resale—the service and facilities that will enable competitors to provide competing *local* telecommunications services—as well as the rates for the transport and termination of telecommunication traffic qualify as "charges . . . for or in connection with intrastate communications service." Pet. App. 15a (emphasis in original).

Yet this assumption is inappropriate for determining jurisdiction. As other courts have repeatedly held, "'the key issue[] . . . is the nature of the communications which pass through the facilities, not the physical location of the lines.'" *California v. FCC*, 567 F.2d 84, 86 (D.C. Cir. 1977), *cert. denied*, 434 U.S. 1010 (1978) (citation omitted). There are no limits on a carrier's use of interconnection, unbundled network elements and resale. In any event, there is no record substantiation for the Eighth Circuit's conclusion, and the court should not have acted as a fact-finder on this point. To the contrary, interconnection, network elements, and resale

---

104, 115 (D.C. Cir. 1989).

will be used—and in fact are already being used—for both intrastate and interstate telecommunications services.

2. The Eighth Circuit Failed to Recognize the Significant Role Preserved for the States by the 1996 Act

Contrary to the Eighth Circuit's view, the shared federal/state jurisdiction scheme in the 1996 Act preserves a significant and important role for state regulatory commissions. Allowing the FCC to define costing standards for purposes of section 252(d) does not make state commissions into ministerial actors. Rather, it reflects a recognition that rate-setting determinations are complex and highly evidence-dependent. Thus, the Act places these decisions in the purview of state commissions, which have far more experience in ratemaking proceedings than the FCC. In order to make specific rate "determinations," state commissions must sift through a vast amount of cost data in order to ensure that the rates set are cost-based.

There is nothing in the FCC's rules that requires a state commission to attach a pre-ordained number to interconnection rates. Establishing a costing methodology, in this case a forward-looking pricing model, does not dictate specific interconnection, network element or resale prices for state commission adoption. For instance, the FCC's rules allow states to determine cost of capital, depreciation and other factors to "plug into" the forward-looking pricing model, because the financial state of carriers and the costs of providing service will sometimes vary from state to state.

In setting "proxy" rates, of course, the FCC actually prescribed particular rates for unbundled network elements and interconnection to be used as "default" prices if a state commission were unable to undertake the full cost analysis

necessary to determine rates within the prescribed statutory timeframe for arbitrations. *First Report and Order* ¶ 619. In this respect, the FCC overstepped its authority because it actually "established" or "determined" prices by setting actual proxy rates for use in lieu of state-determined rates. This issue is moot, however, because the proxy rates applied only where states could not adopt costing methodologies to set prices within the Act's time constraint on state-supervised interconnection arbitrations. Thus, the FCC's use of proxies is not a ground for affirming the court of appeals.

III. THE COURT OF APPEALS CORRECTLY UPHELD THE FCC'S INTERPRETATION OF THE ACT'S "REBUNDLING" PROVISIONS, BUT ON REHEARING IMPROPERLY STRUCK DOWN THE FCC'S RULE PROHIBITING DISASSEMBLY

A. The Eighth Circuit Correctly Concluded That the FCC's Rebundling Rule Complies with the Plain Meaning of the Act

It is undisputed that section 251 grants the FCC authority to promulgate federal unbundling rules. *See* 47 U.S.C. § 251(d)(1). Rather, the issue raised by incumbent carriers[9] before this Court is whether the FCC's implementation of section 251 contravenes the Act's requirement that incumbent local exchange carriers "shall provide such

---

[9] Conditional Cross-Petition of Regional Bell Companies, *Ameritech Corp. v. FCC*, No. 97-1075 (question 1); Conditional Cross-Petition, *GTE v. Midwest, Inc. v. FCC*, No. 97-1087 (question 1); Conditional Cross-Petition of USWest, *US West, Inc. v. FCC*, No. 97-1099 (question 1); Conditional Cross-Petition of the Mid-Sized Local Exchange Carriers, *The Southern New England Telephone Co. v. FCC*, No. 97-1141 (question 1).

unbundled network elements *in a manner that allows* requesting carriers to combine such elements in order to provide telecommunications service." 47 U.S.C. § 251(c)(3) (emphasis added). The FCC's rule 51.315(b) allows a competing carrier to combine leased network elements to provide a full retail, or "finished," telecommunications service. *First Report and Order* ¶ 356. As the Eighth Circuit concluded, this "rebundling" rule comports with Congress's expressed intent and should be upheld. Pet. App. 54a.

1. The FCC's Rebundling Decisions Must Be Upheld In Light of the Plain Language of Section 251(c)(3)

Where a statute is clear by its language, courts will defer to an administrative agency's implementing interpretation that is consistent with the statute. *Chevron*, 467 U.S. at 842-43. Because section 251(c)(3) expressly contemplates that competing carriers may "combine" unbundled network elements leased from incumbent local carriers in order to "provide . . . telecommunications service," 47 U.S.C. § 251(c)(3), on this point the court of appeals correctly deferred to the FCC. Pet. App. 55a-56a. The agency's interpretation is compelled by the 1996 Act, while the arguments of the Cross Petitioners seek to add language that does not exist in the 1996 Act.

Nothing in the language or structure of the Act precludes the FCC's rule. Cross Petitioners each assert that competing carriers should not be permitted to offer "finished services" through leased unbundled elements without providing any facilities of their own. *See generally* US West Petition at 5-6; Ameritech Petition at 14-22. They argue that section 251(c)(3)'s requirement to provide "nondiscriminatory access to unbundled network elements at any

technically feasible point" is inconsistent with the FCC's rule, reasoning this language would become a "fiction" if no facilities are provided by the competitor. Ameritech Cross-Petition at 18; *accord* US West Petition at 5.

The crucial flaw in this argument is that section 251 merely ensures that the requested access be provided wherever a requesting carrier seeks such access so long as it is "technically feasible." 47 U.S.C. § 251(c)(3). Had Congress intended to limit competitors to unbundled elements only in conjunction with their own facilities, as Cross Petitioners insist, then Congress could, and would, have included such a restriction expressly. Congress did not, and therefore this restriction cannot be read into the text.[10]

Likewise, permitting competitors to provide finished services through combinations of leased network elements in no way obviates the distinctive entry modes established in the Act. *See supra* pp. 4-5. Cross Petitioners contend that the FCC's rule undermines the "incentive" for facilities-based entry. *See* Ameritech petition at 15; US West Petition at 4-5. Yet, despite incumbent carriers' protests, very real and substantial distinctions still exist between the use of network elements to provide telecommunications services and entry through resale, and each mode of entry retains its own advantages and disadvantages. For instance, carriers reselling incumbents' services are left offering only the services that are already provided to local customers. On the other hand, by purchasing unbundled network elements,

---

[10] *Consumer Product Safety Comm'n v. GTE Sylvania, Inc.*, 447 U.S. 102, 108 (1980) (holding that when Congress explicitly states its will "that language must ordinarily be regarded as conclusive"); *see also United States v. American Trucking Ass'ns*, 310 U.S. 534, 543 (1940) ("There is, of course, no more persuasive evidence of the purpose of a statute than the words by which the legislature undertook to give expression to its wishes.").

competitors are free to enhance or embellish the service offering, provide different service packages and distinguish their offerings from those of the incumbents to provide customers with a variety of service alternatives. As the Eighth Circuit also found, "unbundled access has several disadvantages that preserve resale as a meaningful alternative." Pet. App. 56a.

Cross Petitioners' reliance on isolated phrases in the legislative history to suggest a congressional "preference" for one form of entry over another similarly fails. *See, e.g.*, Ameritech Cross-Petition at 18-19. First, reliance on legislative history when the statutory language is clear is unnecessary and improper.[11] The statutory language is clear. Second, contrary to the incumbent carrier assertions, neither the Act nor the legislative history exhibits a congressional bias toward facilities-based competition. *See* Ameritech Cross-Petition at 18-19. Rather, Congress created several avenues for entry into the local market. As the Eighth Circuit recognized, it is not correct to presume that "the Act's exclusive goal is facilities-based competition." Pet. App. 59a. Therefore, even if the FCC's rebundling rule would suppress development of facilities-based competition, Cross Petitioners' remedy must come through a congressional amendment, not from this Court.

---

[11] *See Blum v. Stenson*, 456 U.S. 886, 896 (1984) ("We look first to the statutory language and then to the legislative history if the statutory language is unclear."); *Unexcelled Chemical Corp. v. United States*, 345 U.S. 59, 63 (1953)(concluding that investigation of legislative history is improper where "the words Congress used . . . are too precise for extended argument").

2. The Cross-Petitioners Inappropriately Ask This Court to Substitute Its Judgment for That of the Expert Agency

The Cross Petitioners' principal argument for prohibiting rebundling has no basis in the statutory language. Cross Petitioners complain that rebundling elements allows competitors to "capture" their most "profitable customers without providing service more efficiently or investing one cent in competitive network facilities." Ameritech Cross-Petition at 15; *see* GTE Cross-Petition at 6. Even if true, this argument should be addressed to Congress, not the Court.

When competitors enter the market through access to network elements, the 1996 Act requires that incumbents charge prices that are "based on cost." 47 U.S.C. § 252(d)(1). Resale services are to be priced at a discount off the incumbent's retail prices that reflects the costs that will be "avoided" by the incumbent carrier. 47 U.S.C. § 252(d)(3). In the competitive market envisioned by Congress, prices for telecommunications services will be driven toward costs. Consequently, as competition develops and prices move toward cost, the retail offerings of incumbents would also move toward cost.[12] Correspondingly, as retail rates decline, wholesale rates for resale of incumbent services would likewise decline toward cost. Clearly, over time with the development of competition, these rates would converge with those paid for use of unbundled network elements. Thus, to the extent a price

---

[12] Incumbents contend that movement of prices toward costs in the retail environment would undermine the policy goal of universal service. *E.g.*, Ameritech Petition at 23. However, Congress provided that the FCC address this issue separately in section 254. 47 U.S.C. § 254. Thus, any demonstrable failure of local rates to recover costs would be appropriately recovered through universal service reform.

differential persists between the use of unbundled elements and resale, that differential represents residual monopoly profits that do not reflect the true costs of service or prices that would occur in a competitive local telephone marketplace.

Without any hook to the language of the 1996 Act, the incumbent local carriers are asking this Court to substitute another policy rationale for the will of Congress. *See Tennessee Valley Auth. v. Hill,* 437 U.S. 153, 194 (1978) ("Our individual appraisal of the wisdom or unwisdom of a particular course consciously selected by the Congress is to be put aside in the process of interpreting a statute."). The intent of Congress to allow rebundling of unbundled elements is unmistakable; to overturn the FCC's rule would be to allow the judiciary to rewrite section 251 in derogation of Congress's expressed goals.[13]

B. The Eighth Circuit Erred in Overturning on Rehearing the FCC's "Disassembly" Rule 51.315(b)

Section 251 requires that incumbents provide "nondiscriminatory access" to unbundled network elements "in a manner that allows requesting carriers to combine such elements in order to provide" telecommunications service. 47 U.S.C. § 251(c)(3). In promulgating rule 51.315(b), the FCC concluded that the "nondiscrimination" requirement bars incumbent carriers from pulling apart previously joined network elements for the purpose of imposing anticompetitive costs on new entrants that request access to those elements. *First Report and Order* ¶ 293; 47 C.F.R. §

---

[13] *See Mobil Oil Corp. v. Higginbotham,* 436 U.S. 618, 626 (1978)("[W]e have no authority to substitute our views for those expressed by Congress in a duly enacted statute.").

51.315(b). The agency held that the ability of requesting carriers to "rebundle" elements did not preclude this requirement, since it is one "manner" in which competitors could "combine" elements. On rehearing, however, the Eighth Circuit found that the statutory language precluded the FCC's interpretation and vacated the rule. Pet. App. 52a-53a. This holding is not supported by the language of the Act and must be reversed.

First, as the FCC correctly determined, to permit incumbent carriers to break apart elements that competitors purchase would be discriminatory and anticompetitive, in contravention of the statutory requirement that incumbent local carriers must provide unbundled elements in a *nondiscriminatory manner*. The Eighth Circuit's opinion never addresses this critical statutory requirement. As the FCC found, local carriers do not pull apart network elements to provide them to their own retail operations. *See First Report and Order* ¶ 296. Rather, typically they simply provide service using the existing, combined elements. *Id.* Further, there is no technical reason to disassemble elements that will just be recombined. *Id.* Thus, the FCC's rule 51.315(b) prevents incumbents from imposing the unnecessary cost and delay on their competitors that is not imposed on its own provision of service, and is necessary to meet the statutory requirement of nondiscrimination.

Second, while section 251 clearly grants expansive access to unbundled network elements, 47 U.S.C. § 251(c)(3), the statute does *not* directly address the specific "manner" in which those elements must be provided. When implementing this requirement, as directed by section 251(d), the FCC therefore determined that section 251 requires incumbent local carriers to recombine network elements. That determination must receive deference as a reasonable interpretation of an ambiguous statute, and the

reviewing court is precluded from substituting its own policy goals for those of the FCC. *Chevron*, 467 U.S. at 843-44. The Eighth Circuit violated this well-settled precept of judicial review when it overturned the FCC's recombination rule based on its differing statutory interpretation.

The Eighth Circuit purported to rely on the plain language of section 251, stating that the Act requires competitors, not incumbents, to "combine" elements. *See* Pet. App. 53a. The statutory language does not, however, preclude competitors from "combining" elements *through the incumbent*.[14] Because the FCC's rule did not directly *conflict* with section 251, the Eighth Circuit was bound to uphold it. *Chevron*, 467 U.S. at 843-44.

Moreover, as discussed *supra*, Section II.B, the FCC has generic rulemaking authority under the Communications Act to require carriers to combine network elements, so long as such a requirement is not inconsistent with the statutory language.[15] As discussed above, this language is essential to implement the nondiscrimination requirements of the Act and does not in fact "collapse" the "careful distinctions Congress has drawn" between market entry through unbundled network elements and resale. *See supra*, pp. 4-5.

---

[14] The Eighth Circuit's observation that the incumbent carriers do not wish to combine elements is irrelevant to this analysis. Pet. App. 52a-53a. By that reasoning, most of the requirements of the Act, which are aimed at breaking the incumbents' local monopoly, would be overturned. Under settled principles of judicial review, however, the court is precluded from substituting its judgment for that of the expert agency, unless the agency's rules conflict with the statutory language. *Chevron*, 467 U.S. at 842-43. No such conflict exists, and incumbent intransigence does not raise such a conflict.

[15] *See Second Computer Inquiry*, 77 F.C.C.2d 384, 442-444 (1980), *aff'd sub nom., Computer and Communications Industry Ass'n v. FCC*, 693 F.2d 198 (D.C. Cir. 1982)(establishing unbundling requirements under its general statutory authority).

Thus, the Eighth Circuit erred in vacating the FCC's rule 51.315(b), and must be reversed.

CONCLUSION

The judgment of the court of appeals should be reversed in part as to the FCC's pricing rules and rule 51.315(b), and affirmed in part as to the FCC's "rebundling" rule.

BRIEF OF RESPONDENT GST TELECOM, INC. IN SUPPORT OF PETITIONERS

Respondent GST Telecom, Inc., respectfully submits this Brief in Support of Petitioners.

OPINIONS BELOW

The opinions below are identified in the Briefs filed by Petitioners. They are reproduced in the Petitioners' Appendix.[1]

JURISDICTION

The basis for this Court's jurisdiction is set forth in the Briefs filed by Petitioners.

STATUTORY PROVISIONS INVOLVED

The statutory provisions involved are identified in the Briefs filed by Petitioners. They are reproduced in the Petitioners' Appendix.

STATEMENT OF THE CASE

Respondent GST Telecom, Inc. (GST), vigorously supports the various petitioners, especially the Federal Communications Commission (FCC), who have requested that this Court undo the Eighth Circuit Court of Appeals' policy foray into the joyously dynamic and utterly technical world of competitive telecommunications. In essence, the Court of Appeals stepped into the vortex of telecommunications reform set into motion by the Telecommunications Act of 1996 (Act), Pub. L. No. 104-104, 110 Stat. 56, and, seizing upon disparate statutory elements that might have appeared comfortably traditional, apparently engaged in an act of interpretation without regard to

---

[1] Petitioners' Appendix (hereinafter "Pet. App.") refers to the appendix to the petition for a writ of certiorari in *AT&T Corp., et al. v. Iowa Utilities Board, et al.*, Docket No. 97-826, which seeks review of the same judgment as Petitions for Writ of Certiorari filed by Petitioners Association for Local Telecommunications Services, *et al.*; MCI Telecommunications, Inc.; and Federal Communications Commission and United States of America, and which has been adopted by said petitioners.

the 1996 Act's design as a whole. Unfortunately, the Court of Appeals failed to recognize that this heavily brokered body of reform legislation more closely compares to a grand mosaic where the whole masterfully exceeds the sum of its parts.[2] *Iowa Utilities Board v. FCC*, 120 F.3d 753 (8th Cir. 1997).[3]

Consistent with Congress's general desire to "encourage the rapid deployment of new telecommunications technologies" and "secure lower prices and higher quality services for American telecommunications consumers," 110 Stat. 56, 56 (1996), the overall legislation constitutes a comprehensive plan for displacing local telephone monopolies with competition and choice. Without a doubt, the legislation also constitutes a no-nonsense approach to catapulting a new class of telecommunications providers—competitive local exchange carriers (CLECs)—into the local exchange marketplace. Thus, Congress dramatically altered the national telecommunications landscape when it redefined the status quo through four key provisions that ended more than six decades of the old guard's co-dependence on captive rate-payers in the non-competitive local exchange environment.

The Act's key provisions (1) conferred explicit authority on the FCC to complete all actions necessary to establish regulations that would govern interconnection agreements between incumbent local exchange carriers (ILECs) and CLECs; (2) established a procedural

---

[2] Indeed, in an *amici* filing submitted to the Court of Appeals to counterbalance a prior *amici* filing by four members of the House, six members of the House and Senate confirmed that "the Act was the product of many successful compromises among a variety of competing views and interests, and reflects the customary give and take of the legislative process." Brief of Amici Curiae Bliley, *et al.* at 3, *Iowa Utilities Board v. FCC*, 120 F.3d 753 (8th Cir. 1997) (No. 96-3321). Excerpts of the Brief have been lodged with the Court.

[3] The text of the Court of Appeals' decision has been submitted to the Court in Pet. App. at 1a-67a.

framework requiring state public utility commissions (PUCs) to arbitrate failed interconnection negotiations between ILECs and potential competitors; (3) conferred jurisdiction on the FCC to preempt enforcement of any legal requirement that would interfere with the ability of any telecommunications service provider to provide any interstate or intrastate telecommunications service; and (4) established a basis for permitting the Bell operating companies (BOCs)—who presently qualify as the nation's preeminent ILECs—to petition the FCC for authority to provide long distance telephone services. *See generally* 47 U.S.C. §§ 251, 251(d)(1), 252, 253, and 271.

As the FCC and the other various petitioners have demonstrated, the Court of Appeals—at the behest of a consortium of ILECs and state PUCs—invalidated a number of central rules the FCC adopted pursuant to its congressional mandate to establish implementation regulations governing interconnection. Looking backwards to pre-Act rulings governed by the question of whether telephone service amounted to interstate or intrastate service, the Court of Appeals was somehow persuaded that the FCC's pricing methodology governing interconnection qualified as purely intrastate regulation beyond the FCC's jurisdiction limits.[4] (Pet. App. at 8a-24a.) In another surprising instance, the Court of Appeals substituted its policy judgment for the FCC in vacating the so-called "pick and choose" rule, which entitled CLECs to select the more favorable terms an ILEC may have extended to other parties in prior interconnection agreements. (Pet. App. at 24a-27a.) Finally, on rehearing, the Court of Appeals vacated an FCC rule that prohibited ILECs from

[4] Prior to the Act, the notion of FCC interstate jurisdiction related to long distance toll traffic that crossed state lines, while intrastate jurisdiction applied to in-state long distance toll traffic and local exchange service. On its face, the Act has blurred this "traditional" jurisdictional dividing line into extinction, as it expressly places the FCC at the helm of establishing interconnection rules to implement local exchange competition.

separating preexisting combined network elements. (Pet. App. at 70a-71a.) As a result of this most recent ruling, competitors providing service through purchased combinations of an ILEC's unbundled network elements can no longer obtain these elements on a less costly combined basis.

To avoid belaboring this Court with overly redundant briefings, respondent GST adopts and incorporates by reference the citations, arguments, and statutory and case analyses submitted by the FCC and the various other petitioners. GST's briefing aims to support and supplement the petitioners' compelling filings with a ground-level CLEC perspective as to what the Act means and why the Court of Appeals (1) erred in determining the FCC exceeded its jurisdictional limits in establishing a pricing methodology governing interconnection; and (2) abused its discretion in vacating the FCC's pick and choose rule, which falls within the ambit of both congressional intent and the plain language of § 252(i).[5] 47 U.S.C. 252(i).

SUMMARY OF ARGUMENT

The Court of Appeals erred in holding that the FCC exceeded its jurisdiction in establishing pricing principles relating to interconnection, as the plain language of sections 251(c)(2) and 251(c)(3), when read *in pari materia*

[5] Conducting business as a CLEC throughout the Western United States and Hawaii, GST has relied upon the dictates of the Act to deploy local exchange switches and fiber optic networks in states ranging from Idaho, to New Mexico, to California, to Hawaii, and in cities from Boise and Spokane, to Tucson and Honolulu, to name but a few. More significantly, GST epitomizes what the future of telecommunications is all about as it integrates a full panoply of services into a "one-stop shop," where consumers obtain their local, long distance, and data services from the same carrier over the same network facilities. CLECs like GST, however, still require dominant carriers to provide reasonably priced, nondiscriminatory interconnection and unbundled network elements, so GST's customers can place telephone calls to customers who subscribe to competing carriers.

with section 251(d)(1), compels the FCC to adopt such pricing standards. *See* 47 U.S.C. §§ 251(c)(2), 251 (c)(3), and 251(d)(1). In essence, the plain language of section 251(d)(1) unambiguously empowers the FCC to complete "all actions necessary to establish regulations to implement" section 251, which features express requirements relating to pricing at sections 251(c)(2) and 251 (c)(3). Section 251—and the panoply of FCC interconnection regulations it anticipates—easily qualify as the heart of the Act. Thus, in adopting a pricing methodology to prevent the former monopolists from imposing unreasonable costs for interconnection, the FCC complied with the dictates of the Act and fulfilled congressional intent.

To reach its erroneous conclusion, the Court of Appeals, looking backward to pre-Act "tradition" that limited FCC jurisdiction to interstate toll traffic, failed to apprehend that the Act, in its totality, constitutes a comprehensive paradigm shift that renders the former interstate-intrastate dichotomy meaningless. Indeed, as a body of reform legislation calculated to integrate regulated local exchange monopolists into unregulated local markets, the Act codifies the interconnection process as a matter of national law and policy. In misapprehending the breadth and purpose of this ground-breaking statutory design, the Court of Appeals erred as a matter of law in limiting the FCC's jurisdiction on the issue of pricing principles.

Finally, the Court of Appeals abused its discretion when it vacated the FCC's "pick and choose" rule, which, as a matter of the FCC's informed policy judgment, permitted new entrants to obtain "any interconnection, service, or network element provided under an [existing] agreement" without having to accept all other terms of such an agreement. *In re Implementation of the Local Competition Provisions in the Telecommunications Act of 1996,* 11 FCC Rcd. 15,499 (1996) (First Report and Order), Pet. App. at 261a-268a. Such a rule would have impeded the ILECs' tendency to discriminate against new entrants in the pricing of facilities—especially where the new en-

trants stand at the mercy of the ILECs' bottleneck control and superior bargaining power. The Court of Appeals should have given deference to the FCC's greater contextual experience in adopting such a rule, which was also consistent with the congressional intent expressed at section 252(i).

ARGUMENT

I. THE COURT OF APPEALS ERRED AS A MATTER OF LAW IN DETERMINING THAT THE FCC EXCEEDED ITS JURISDICTIONAL LIMITS IN ESTABLISHING A PRICING METHODOLOGY TO CALCULATE THE COSTS INCUMBENT CARRIERS INCUR IN OPENING THEIR FACILITIES TO COMPETITORS.

A. The Court of Appeals Erred in Favoring Pre-Act Section 2(b)(1) Over a Comprehensive Array of Interconnection Provisions That Plainly Empower the FCC To Establish Pricing Principles Relating to Interconnection Under the Act.

First and foremost, the Court of Appeals' opinion frustrates section 251's fundamental purpose of advancing the Act's goals. Section 251—as a matter of federal law—establishes a mandatory duty requiring the ILECs to (1) provide competing carriers with nondiscriminatory network interconnection; (2) provide unbundled network elements at just, reasonable, and nondiscriminatory prices; and (3) resell services to other carriers at wholesale rates on a nondiscriminatory basis. *See generally* 47 U.S.C. §§ 251(c)(2), 251(c)(3), and 251(c)(4). Even more significantly, section 251(d)(1) directs the FCC to "complete all actions necessary to establish regulations to implement the requirements" of section 251 within six months of enactment.

The plain language of section 251(d)(1), in particular, gives rise to three critical policy inferences germane to this case. First, this provision imposes a no-nonsense, six-

month time line that confirms Congress's commitment to bring about network interconnection among competing carriers on a fast-track basis. For all intents and purposes, Congress ordered the FCC to embark upon an all-out, light-speed mission to promulgate a sweeping body of revolutionary regulations grounded in technical requirements and antitrust considerations.[6] Secondly, in commissioning the FCC, a federal agency, to promulgate the interconnection rules, Congress ordained that interconnection in the local exchange constitutes a matter of compelling national interest.

Finally, and most pertinent of all, the plain language of section 251(d)(1) unambiguously establishes the FCC as *the* regulatory body broadly empowered to complete "all actions necessary" to establish the regulations envisioned under section 251, including, presumably, the express requirements set forth at sections 251(c)(2) and 251(c)(3). Among other things, these subsections require that the ILECs provide interconnection and unbundled network elements "on rates, terms, and conditions that are just, reasonable and nondiscriminatory"—especially as they relate to the requirements set forth in sections 251 *and* 252. Thus, the Court of Appeals should not have held that the FCC exceeded its jurisdiction in establishing pricing principles relating to interconnection, as the plain language of sections 251(c)(2) and 251(c)(3), when read in conjunction with section 251(d)(1), compels the FCC to adopt such pricing standards.

For any new CLEC having to contend with unyielding ILECs and uncertain state PUCs, section 251(d)(1) presents distinctively straightforward policy implications that help to explain why Congress looked to the FCC to establish the Act's interconnection rules. Aside from its obvi-

---

[6] The six-month deadline also signaled the ILECs not to slow roll or otherwise retard the work of the FCC, which, in a monumental display of government alacrity and efficiency, rose to the occasion in enlightened and decisive fashion. *See* First Report and Order, Pet. App. 131a-337a.

ous goal of achieving national coherence and uniformity—thereby avoiding regulatory fragmentation—in the interconnection process, the overall legislation diplomatically takes into account the likely reality that, in the wake of the Act, too many state PUCs would face capability issues that would retard the process. As it turned out, following enactment, many state PUCs found themselves underbudgeted, understaffed, uncertain and even unwilling to contend with the paradigm shift wrought by the Act.[7] Others made their way to the Court of Appeals to defend both their "turf" and a largely meaningless pre-Act intrastate "tradition" that no longer prevails in the post-Act era of federally imposed local competition—to say nothing of integrated telephony service providers.

Significantly, by its plain terms, the Act authorizes the FCC to preempt any state access or interconnection order that is inconsistent with section 251 or substantially prevents section 251's implementation. In this regard, the Act establishes a minimum federal standard relating to interconnection-related issues, which dovetails with the FCC's jurisdiction and its authority under the Act to preempt any state or local law or rule that imposes a requirement that may prohibit or have the effect of prohibiting the ability of any entity to provide interstate *or* intrastate telecommunications service. 47 U.S.C. §§ 251(d)(3),

---

[7] After more than two years since enactment, some state PUCs have only fairly recently opened cost dockets relating to pricing and interconnection issues. Though such regulatory delays hardly qualify as extraordinary in a context accustomed to monopoly precepts, they are frustrating to investors and murderous to the business case of competitive companies. The Act as a whole, however, contains critical short-term deadlines, demonstrating that Congress meant business in tearing down the time barriers to entry that might impede competitive intrastate telecommunications service. Thus, instead of leaving the job to 50 state PUCs of varying degrees of commitment and ability to wrangle with it, Congress assigned the fast-track interconnection rule-making to the single federal agency with the expertise and wherewithal to ensure timely compliance.

253(a) and 253(d). Again, taken as a whole, the plain language of the Act underscores the FCC's agency expertise and broad powers to construe and implement the Act's interconnection requirements—whether they relate to interconnection pricing policies or to conditions surrounding unbundled access—and to construe and preempt legal and economic barriers to entry.

Despite the Act's comprehensive plan to bring about competition, compel interconnection, and expand the FCC's inherent antitrust role in integrating former regulated monopolists into unregulated local markets, the Court of Appeals resorted to traditional principles of public utility regulation to limit the FCC's jurisdictional authority under the Act. That is, the Court of Appeals looked to section 2(b)(1), a holdover provision from the Communications Act of 1934. Adopted 64 years ago when local exchange telecommunications was considered a natural monopoly, section 2(b)(1) generally precludes the FCC from asserting jurisdiction with respect to "charges" or "regulations" for or in connection with intrastate communication service. Even though the 1996 Act expressly and unambiguously empowers the FCC to compel interconnection and the offering of unbundled network elements "on rates, terms, and conditions that are just, reasonable, and nondiscriminatory," the Court of Appeals determined that the FCC could not exercise this authority unless Congress expressly overrode or modified section 2(b)(1) as it related to limiting the FCC's intrastate authority. *See generally* 47 U.S.C. §§ 2(b)(1), 251(c)(2)(D), 251(c)(3), and 251(d)(1); and *Iowa Utilities Board v. FCC*, Pet. App. at 16a-17a. The Court of Appeals then unreasonably concluded that "the Act does not demonstrate an unambiguous grant of intrastate authority to the FCC." Pet. App. at 17a.

Even if the interconnection requirements that are the subject of the FCC Orders were purely intrastate in character—which Petitioners have persuasively shown they are not—the Court of Appeals' reliance on section 2(b)(1)

would still be misplaced. Given that section 251 expressly empowers the FCC to "complete all actions necessary to establish regulations to implement the requirements" of section 251, and the very same section 251 expressly mandates that ILECs provide interconnection and access to unbundled network elements "on rates, terms, and conditions that are just, reasonable and nondiscriminatory," the Court of Appeals erred in ignoring plain language that empowers the FCC to promulgate pricing principles governing the interconnection process.

B. The Court of Appeals Failed To Apprehend That the Act Dramatically Redefined the States' Role in Implementing Interconnection.

While the Act at section 251 places the FCC in the central role of fashioning federal regulations and enforcing congressional intent as it relates to interconnection in both the interstate *and* intrastate contexts, Congress also saw fit to transform dramatically the role of the state PUCs. Under the old monopoly paradigm, the state PUCs served as public interest watchdogs ensuring that the ILECs spent their money prudently and enjoyed a reasonable and fair rate of return. Thus, in subjecting the monopolists to cost justification and analyzing their requests for rate increases, the state PUCs sought to keep the ILECs solvent while at the same time protecting consumers from unreasonable pricing. Over the years, under the auspices of federal regulations that established elaborate accounting procedures and cost allocation methods, the whole system evolved into a complex game of cat and mouse where the ILECs inundated state regulators with reams of accounting data and an onslaught of "expert" testimony that promoted intricate and outcome-determinative methodologies for computing the desired result. One way or another, either the consumer or the taxpayer paid for this costly exercise, while the reviewing courts astutely left the whole mess to the regulators to set pricing policies and cross-examine the numbers.

Under the Act, however, the state PUCs now preside over the procedural framework that subjects the ILECs to an arbitration process if the parties fail to reach an interconnection agreement within less than six months of initiating interconnection negotiations. 47 U.S.C. § 252(b). Still serving as public interest watchdogs, the state PUCs must now ensure that the ILECs, who enjoy lopsided bargaining power and control the local loops, do not engage in anticompetitive behavior and abuse their bottleneck control over the local exchange market.[8] As the FCC rightly contended in its petition for certiorari, the Act has linked the FCC and state PUCs in "concurrent and complementary pricing roles in fostering competition in local telephone markets," FCC Pet. at 15. In this relationship, the state PUCs must consider specific facts and issues presented for arbitration, and ensure that, in resolving any open issues and imposing conditions upon the parties to the agreement, "such resolution and conditions meet the requirements of section 251, *including the regulations prescribed by the [FCC] pursuant to section 251.*" 47 U.S.C. § 252(c)(1) (emphasis added). Thus, as the other petitioners aptly argued to the Court of Appeals, the FCC and the state PUCs share significant collaborative partnership responsibilities in achieving the Act's goals—with the FCC establishing the overall principles that the state PUCs must apply to ensure that ILEC rates are "just, reasonable, and nondiscriminatory."

Accordingly, the Court of Appeals had no basis to limit the FCC's jurisdictional authority to fashion rules relating to the interconnection process, and should have rejected the jurisdictional issue as an unfounded collateral attack on substantive and well-grounded telecommunications policy that was squarely within both the mandate of the Act and the ambit of the agency's expertise. By convincing the Court of Appeals that the FCC's "pricing" policies jurisdictionally belonged on the "traditional" side of the

[8] "Local loop" refers to the wires that extend from the carrier's switch to the customer's telephone.

intrastate equation, the ILECs and state PUCs effectively blocked the FCC from implementing interconnection and unbundling rates based on a forward-looking cost standard that represented the most just, reasonable and nondiscriminatory basis for developing competitive markets consistent with the purposes of the Act in general, and section 251 in particular.

Even more disconcertingly, if the Eighth Circuit's decision is allowed to stand, the ILECs will have opened the door to the historical abuses associated with playing the numbers and advocating stacked methodologies that will support the recovery of their "embedded costs"—in each and every state PUC. Many state PUCs have already adopted the FCC's forward-looking cost approach, and others will be expected to follow, but the issue will not go away, bringing about more delays and endless litigation. Thus, while the Court of Appeals may have viewed the case presented as a turf battle, its erroneous decision derailed a substantive interconnection policy, thereby impeding the Act's momentum and the nation's prospects for effective long-term competition.

C. The Court of Appeals' Erroneous Decision Undermines the Balance of Interests That Congress Established To Ensure a Rapid Transition to Competition.

To be sure, as part of the compromise process that surrounded the give and take of the Act's legislative genesis, the BOCs, who dominate the nation's local exchange service areas, hardly walked away from the table with hat in hand expressing melancholy regrets of Paradise Lost. To the contrary, in exchange for their cooperation in opening long-established networks and local loops to potential competitors, the Act allows the BOCs to enter the lucrative long distance business upon demonstrating compliance with the Act's competitive checklist at section 271(c)(2)(A). Given the BOCs' long-standing dominance in the local exchange market, generations of loyal local service customers will be expected to sign on as

BOC long distance customers as well, giving the BOCs an extraordinary incentive to slow roll any CLEC desiring both interconnection and a running start in developing market share. This provision warrants mention and the Court's consideration for two compelling reasons: first, given that the Act sets the stage for the integration of local and long distance services through the nation's dominant carrier facilities, it dispels any lingering doubt on the question of whether the Court of Appeals erred in hanging its hat on pre-Act notions of intrastate turf; second, it reinforces, once again, the time-sensitive exigencies structured into the Act and demonstrates why Congress was uncompromising in giving the FCC broad powers to get the job done.

II. THE COURT OF APPEALS ABUSED ITS DISCRETION IN VACATING THE FCC'S "PICK AND CHOOSE" RULE, AND ALSO FRUSTRATED CONGRESSIONAL INTENT EMBODIED IN THE PLAIN LANGUAGE OF SECTION 252(i).

Finally, in throwing out the FCC's "pick and choose" rule, the Court of Appeals, responding to what it perceived as the probable carrier behavior in negotiating interconnection agreements, simply substituted its own uninformed policy judgment for Congress's due deliberation. Section 252(i) provided the FCC with the statutory basis to establish a requirement permitting CLECs to select the more favorable terms an ILEC has extended to other parties in prior interconnection agreements, but—remarkably—the Court of Appeals concerned itself with whether such an approach would "discourage the give-and-take process that is essential to successful negotiations." Pet. App. at 26a.

Section 252(i), however, plainly requires the ILECs to "make available any interconnection, service, or network element provided under an agreement approved under this section to which it is a party to any other requesting telecommunications carrier upon the same terms and con-

ditions as those provided in the agreement." 47 U.S.C. § 252(i). Petitioners have cogently explained why the Court of Appeals' interpretation constitutes a patent violation of the doctrines established by this Court in *Chevron U.S.A., Inc. v. NRDC*, 467 U.S. 837 (1984). From a CLEC perspective, given the ILECs' superior bargaining power, bottleneck control, and consistent tendency to discriminate against new entrants, the FCC reasonably construed section 252(i) to give new entrants the right to obtain "any interconnection, service, or network element provided under an [existing] agreement" without having to accept all other terms of such an agreement. Pet. App. at 261a-268a. Moreover, in a legislative discussion of an earlier version of section 252(i), Congress confirmed that such a requirement was, among other things, necessary to "prevent discrimination among carriers." *See* S. Rep. No. 104-23 at 21-22 (1995). Thus, to the extent that the Court of Appeals' view rests on the assumption that ILECs negotiate fairly, it reflects contextual inexperience at odds with congressional intent, the FCC's agency expertise, and this CLEC's day-to-day reality in contending with the ILECs' friendly but ponderous foot-dragging in providing interconnection—which, given their motive to delay competition, they have raised to the level of performance art.

More problematically, in vacating the "pick and choose" rule, the Court of Appeals not only abused its discretion, but undermined the FCC's inherent antitrust role in integrating former regulated monopolists into unregulated local markets.

CONCLUSION

For the reasons stated, Respondent GST Telecom, Inc., requests that this Court reverse the Eighth Circuit Court of Appeals on the issues presented by Petitioners MCI Telecommunications Corporation; the Association for Local Telecommunications Services, *et al.*; and the Federal Communications Commission and United States of America.

Respectfully submitted,

QUESTIONS PRESENTED

The Telecommunications Act of 1996 was enacted to "shift monopoly [local telephone] markets to competition as quickly as possible." To that end, it adopts new federal requirements that allow new entrants to use essential facilities and services that are controlled by the incumbent local monopolists. This case concerns the authority of the Federal Communications Commission ("FCC") over these new requirements of the Communications Act, and the substantive validity of two regulations that the FCC has determined are crucial to opening local markets to competition. The questions presented are:

1. Whether, despite the explicit grants of authority to the FCC, the Eighth Circuit correctly held that the FCC has no "jurisdiction" either to enforce or to adopt regulations to implement myriad new federal requirements of the Communications Act, that the pricing and some non-pricing requirements of the Act are within the exclusive jurisdiction of state utility commissions to implement, and that the FCC's authority over the remaining non-pricing requirements is limited to adopting narrow interpretative rules?

2. Whether, despite the FCC's undisputed findings that the rule is essential to local competition and supported by the ordinary meaning of the terms of the Act, the Eighth Circuit lawfully invalidated the FCC regulation that allows new entrants to obtain and use existing combinations of network elements and that precludes incumbent monopolists from breaking those elements apart in order to impose additional costs and service outages on their competitors?

3. Whether, despite its acknowledgment that the rule is supported by the Act's terms, the Eighth Circuit lawfully invalidated the FCC's most-favored-nation rule on the basis of its "belief" that the FCC was wrong in holding that the rule would better foster negotiations and more effectively promote the Act's goals?

LIST OF PARTIES AND AFFILIATES

The parties to the proceedings in the Eighth Circuit are listed in the captions of the decisions below, see Petitioners' Appendix A, 1a-4a; Appendix D, 73a-79a, and in Appendix E of the Petitioners' Appendix.

Pursuant to Supreme Court Rule 29.6, petitioners state as follows:

ACC Corporation has no parent company. It has a subsidiary, ACC TelEnterprises, Ltd., which has issued stock to the public.

AT&T Corp. has no parent company. It has an equity interest in the following publicly traded companies:

LIN Television Corporation;
American Mobile Satellite Corporation;
PriCellular, Inc.;
Novell, Inc.;
Lanser Wireless Inc. (Canada); and
SmartTone Telecommunications Holdings Ltd. (Hong Kong).

AT&T owns an interest in the following non-publicly traded company, which has public debt outstanding:

AT&T Credit Holdings, Inc.

America's Carriers Telecommunications Association ("ACTA") is a national association with over 200 members, the core membership of which is comprised of small to mid-sized telecommunications carriers providing competitive long distance services on a regional and national basis. ACTA has not issued shares or debt securities to the public. ACTA does not have

any parent companies, subsidiaries or affiliates that have issued shares or debt securities to the public.

Competitive Telecommunications Association ("CompTel") is an industry association representing the nation's competitive telecommunications carriers, with over 200 members. CompTel has not issued securities to the public, and it does not have any publicly-owned parents, subsidiaries, or affiliates.

Excel Telecommunications, Inc. ("Excel") is a wholly owned subsidiary of Excel Telephone, Inc. which, in turn, is wholly owned by Excel Communications, Inc., a publicly traded company. Excel has no non-wholly owned subsidiaries.

General Communications, Inc. ("GCI") is a publicly traded corporation. GCI, Inc., a wholly owned subsidiary of GCI, is an issuer of publicly traded debt securities. MCI owns 19.3% of the equity of GCI and Kearns-Tribune, Corporation owns 0.9% of the equity of GCI.

Sprint Corporation has no parent companies. Its only nonwholly owned subsidiary is Central Telephone Company (which in turn has wholly owned subsidiaries).

Telecommunications Resellers Association ("TRA") is an incorporated trade association representing over 650 resale carriers and their underlying product and service providers. TRA has no parent companies or subsidiaries.

WorldCom, Inc. ("WorldCom"), a Georgia corporation, is organized for the purpose of engaging in telecommunications and related businesses. WorldCom common stock is traded on The Nasdaq National Market ("NASDAQ") under the symbol "WCOM," and its depositary shares also are traded on NASDAQ under the symbol "WCOMP." On January 29, 1998, WorldCom completed the acquisition by merger of Brooks

Fiber Properties, Inc. (former NASDAQ: BFPT). On January 31, 1998, WorldCom completed the acquisition by merger of CompuServe Corp. (former NASDAQ: CSRV), and its acquisition of ANS Communications, formerly a wholly-owned subsidiary of America Online Inc. (NYSE: AOL). On November 10, 1997, WorldCom announced a definitive agreement to merge with MCI Communications Corp., a publicly held corporation (NASDAQ: MCIC). The two companies expect the merger to close sometime in mid-1998. As of April 3, 1998, WorldCom has no parent companies, subsidiaries, or affiliates that issue shares or debt securities to the public.

OPINIONS BELOW

The initial opinion of the Eighth Circuit reviewing the FCC's *First Report* is reported at 120 F.3d 753 (Pet. App. 1a) and the opinion granting in part and denying in part the petitions for rehearing (Pet. App. 69a) is reported at 120 F.3d 820. The opinion of the Eighth Circuit reviewing the FCC's *Second Report* (Pet. App. 73a) is reported at 124 F.3d 934. The FCC's *First Report* and its *Second Report* in its local competition rulemaking are reported at 11 F.C.C.R. 15499 (1996) and 11 F.C.C.R. 19392 (1996) and reproduced at Pet. App. 131a-353a and the Joint Appendix (J.A. 13-223).

JURISDICTION

The Eighth Circuit's order granting in part and denying in part petitions for rehearing of its decision on the FCC's *First Report* was entered on October 14, 1997. The Eighth Circuit's decision on the FCC's *Second Report* was entered on August 22, 1997. AT&T Corp. filed its petition for a writ of certiorari on November 17, 1997. This Court granted the petitions and cross-petitions filed by AT&T and others on January 26, 1998. This Court's jurisdiction is invoked under 28 U.S.C. § 1254(1).

STATUTORY PROVISIONS INVOLVED

The relevant statutory provisions are 47 U.S.C. §§ 151, 152, 154(i), 160, 201, 208, 251-261, 303(r) (Pet. App. 93a-130a), and § 271 (reproduced in the appendix to this brief).

STATEMENT OF THE CASE

This case arises under the provisions of Title II of the Communications Act (47 U.S.C. §§ 251-276) that were enacted in the landmark Telecommunications Act of 1996. Pub. L. No. 104-104, 110 Stat. 56 (1996). These new federal requirements are intended to promote competition in "all telecommunications

markets"[1] primarily by "shift[ing] monopoly [local telephone] markets to competition as quickly as possible."[2] 47 U.S.C. §§ 251-62. In this regard, the 1996 Act made one radical and fundamental change in state and federal authority over telecommunications: it invalidates the state law prohibitions on competing local intrastate services that alone had previously prevented the Federal Communications Commission ("FCC") and federal antitrust authorities from opening local markets to competition. *Id.* § 253. Correlatively, the Act establishes new mechanisms to allow the States to advance the policy of "universal service" that had provided the only legitimate reason for their earlier legal entry barriers. *Id.* § 254.

However, the questions in this case arise under other sections of the Act: the provisions of §§ 251 and 252 in which Congress took additional steps to assure that new local service providers could rapidly acquire the capabilities that they need to offer services in competition with the monopoly of an incumbent local exchange carrier ("LEC"). These provisions allow new entrants to obtain essential facilities that a LEC controls under rates, terms, and conditions that are nondiscriminatory and cost-based, and to use the facilities to provide the competing services that § 253 authorizes. To implement §§ 251 and 252, the FCC adopted rules that would do no more than enable new entrants to use a LEC's essential facilities at the same economic cost, and other terms and conditions, that the LEC itself enjoys.

In the decisions before the Court, the Eighth Circuit vacated a number of these rules. First, it held that the FCC lacks jurisdiction over the Act's pricing requirements that are the single most important determinant of whether local competition

---

[1] Joint Explanatory Statement of the Comm. of Conference, H.R. Conf. Rep. No. 104-458 at 113 (1996), reprinted in 1996 U.S.C.C.A.N. 124, 124.

[2] H.R. Rep. No. 104-204, at 89 (1995), 1996 U.S.C.C.A.N. 10, 55.

can develop as well as over certain non-pricing requirements.

Second, in those areas where the Eighth Circuit upheld the FCC's jurisdiction, it vacated FCC rules that give effect to the Act's explicit requirements and that are essential to the creation of the competition that Congress intended. Foremost, the Eighth Circuit vacated the FCC rule that implemented the requirement of "nondiscriminatory access to network elements on an unbundled basis" by allowing new entrants to obtain network elements in the same combined forms that the LECs provide them to themselves. This decision has led LECs to insist on a right to rip out existing physical connections among elements, thereby preventing the only form of local exchange competition that is today feasible on a widespread basis. The Eighth Circuit also vacated a rule that merely requires LECs to provide all new entrants with elements on the same terms.

As explained in detail below, these holdings are contrary to the Act's terms, structure, and purposes. However, the Eighth Circuit's jurisdictional and nonjurisdictional holdings also rest on a pervasive misunderstanding of the regulatory background against which the 1996 Act was passed and of how this Act did and did not change the law. In particular, the Eighth Circuit has interpreted the 1996 Act amendments to the Communications Act to (1) deny the FCC the jurisdiction over local exchange facilities that it already had under the Act's other provisions and (2) permit the discrimination against providers of interstate or intrastate services that was prohibited under the prior FCC regulations and federal antitrust decrees that § 251(g) requires the FCC to enforce until it adopts "supersed[ing]" regulations.

1. Local Telephone Service And The FCC And State Regulation Of It Prior To The 1996 Act.

Local telephone service is provided through a network that contains seven types of facilities or "network elements" that are

connected to one another physically and (through software in central control facilities) logically. But at the most basic level, a local telephone network consists of telephone wires -- called "local loops" -- that are strung along telephone poles or buried beneath city streets in cables and that connect each home or business in the area to an "end office switch." That switch will, directly or through other switches, route a call over transport facilities and other wires to the party being called.

All the jurisdictional issues in this case can be addressed by focusing on one network element: the "local loop." Like all other facilities in local networks, a local loop can be used to place and receive either calls that begin and end in the same State ("intrastate services") or calls that begin and end in different States ("interstate services"). Under the original Communications Act of 1934, regulatory authority over local loops and other facilities was generally divided between States and the FCC depending on how the loop was being used. States generally exclusively regulated the facility when used to provide intrastate services and the FCC had exclusive regulatory jurisdiction when the loop was used to provide interstate services, which were defined to include any service or facility that cannot be severed into interstate and intrastate components for purposes of the FCC's regulation.

This jurisdictional division resulted from § 2 of the Communications Act and the limited scope of the provisions that then comprised Title II of this Act. While § 2(a) gives the FCC jurisdiction over interstate services, § 2(b) provides that "no provision of the Act shall be construed to apply or to give the [FCC] jurisdiction" over rates and other conditions of intrastate services, and Title II of the Act then applied only to the rates, terms, and conditions of the interstate services of communications common carriers. 47 U.S.C. §§ 201-208.

In *Louisiana Public Service Commission* v. *FCC*, 476 U.S.

355 (1986), the Court thus held that the FCC lacked the authority to prescribe depreciation charges that would bind States in setting rates for intrastate services. The Court held that no provision of the Act unambiguously gave the FCC authority to prescribe depreciation charges that apply to rates for intrastate services. *Id.* at 379. The Court further concluded that the FCC's authority over interstate services could not justify its order, for another provision of the Act (§ 221) separated LEC investment in local loops and other facilities between interstate and intrastate services and allowed States and the FCC to apply their own depreciation rates to the portion of the LEC investment allocated to its jurisdiction. *Id.* at 375.

By contrast, it was equally well-settled under § 2 and the original terms of Title II (and their statutory predecessors) that the FCC had jurisdiction over local loops and other local exchange facilities in two circumstances. The first is when LEC networks are used to provide the "exchange access" service of originating or terminating interstate long distance calls, which are interstate services over which the FCC exclusively regulates the rates, terms, and conditions. See, *e.g.*, *Smith* v. *Illinois Bell Tel. Co.*, 282 U.S. 133 (1930); *NARUC* v. *FCC*, 746 F.2d 1492 (D.C. Cir. 1984). More than 20% of the LECs' $100 billion in annual revenues are from interstate exchange access services, and 25% of the LECs' investment in local loops is today allocated to interstate services. 47 C.F.R. § 36.154(c).

Second, the FCC had exclusive jurisdiction over a local loop and associated switching and transport facilities when a customer obtained it as part of a "private line," "private network," or other service in which a customer essentially "leases" an entire loop for a flat monthly charge and in which the customer will use the loop and the associated facilities or services to place both interstate calls and intrastate calls. Because the "service" obtained by the customer inherently encompasses both interstate and intrastate uses and cannot be

separated into components, the entire service is classified as an "interstate" service over which the FCC regulated rates, terms, and conditions.[3] This same principle was also applied to uphold the FCC's jurisdiction to require LECs to unbundle competitively priced telephone sets and other "customer premises equipment" ("CPE") from their local loops and to provide standard interfaces on their loops that equally accommodate other vendors' CPE. See *infra*.

At the same time, because of § 2(b) of the Communications Act and the limitations on the original scope of Title II, the FCC then had no authority to preempt state law entry barriers and to authorize the customer of the dedicated loops, CPE, or other facilities to use them to offer intrastate services in competition with LECs. Thus, the FCC's CPE and private network regulations operated only to establish rates, terms, and conditions under which a customer could obtain the loop and other associated facilities for its own use -- except in any States that authorized competing intrastate local services.

But until shortly before the 1996 Act was passed, virtually no State had authorized this competition for intrastate services. As courts had found, network externalities and the enormous economies of scale that characterize some or all of the components of local telephone networks meant that it was a natural monopoly and that no firm could make the "prohibitive capital investment" required to duplicate them. *See United States* v. *Western Elec. Co.*, 673 F. Supp. 525, 538 (D.D.C. 1987). However, the States prohibited competing intrastate local services even for the customers and services for which it was commercially possible. The reason is that they concluded that selective competition would undermine the system of

---

[3] *See, e.g.*, 47 C.F.R. § 36.154(a)(subcategory 1.2); *MTS and WATS Market Structure*, 4 F.C.C.R. 5660 (1989); *California* v. *FCC*, 567 F.2d 84 (D.C. Cir. 1977) (per curiam).

"universal service" in which certain LEC services were provided at rates that were far in excess of their costs in order to support allegedly below-cost rates for rural or other customers.

2. The FCC's Pre-1996 Efforts To Foster Competition.

LECs also historically used their monopolies over local exchange facilities to prevent competition in the provision of (1) the telephone sets, business telephone systems, and other customer premises equipment that can be plugged into local loops, (2) the long distance services that can, through highly complex interactions with LEC transmission and switching equipment, be competitively provided by multiple firms, and (3) any competing local services that were authorized. The LECs foreclosed this competition first by refusing to allow interconnection of competing firms' services or products and then, when interconnection was ordered, denying the new firms access at the same economic costs and other terms and conditions that the LECs' products and services enjoyed.

For example, the FCC initially sought to introduce competition into the provision of customer premises equipment by invalidating LEC prohibitions against a customer's interconnection and use of other firms' equipment. The LECs responded by imposing requirements that made it more expensive and complicated for customers to use a LEC's local network if they obtained CPE from a LEC competitor. These discriminatory interconnection requirements were found (over 13 years later) to have been a "sham" imposed solely to raise rivals' costs. *See Litton Sys., Inc.* v. *AT&T*, 700 F.2d 785, 794-802 (2d Cir. 1983). In 1975, the FCC prescribed interface standards for local loops that were intended to apply without discrimination to all customer premises equipment. *See id.* at 795-98. In 1980, the FCC ordered LECs to unbundle their customer premises equipment from their monopoly local services by stating separate prices for each and giving customers

the option of using another vendor's CPE. It further ordered LECs to provide their CPE at competitively set prices and free of state rate regulation which was thereby preempted.[4]

Although customer premises equipment was then said to be used for intrastate services 97% of the time, courts of appeals upheld each of these regulations against claims that they invaded the States' exclusive jurisdiction under § 2(b). The courts concluded that the equipment at issue and the local loops were used to provide interstate as well as intrastate services, and that there was no practical basis for the FCC to regulate only the interstate uses.[5] These holdings were cited with approval in *Louisiana* (*see* 476 U.S. at 375-76 n.4), and courts of appeals uniformly followed them after *Louisiana* was decided in 1986.[6] At the same time, as with the case of the FCC's regulations of dedicated loops and private network services, the FCC's CPE regulation did not -- and could not then -- preempt State law prohibitions against competing local exchange services, so these FCC regulations, too, only assured that a customer could interconnect non-LEC switching and other equipment for use with that customer's own telephone services.

Beginning in the 1970s, the FCC also sought to foster competition in the provision of interstate long distance services

---

[4] *Second Computer Inquiry*, 77 F.C.C.2d 384, 388, 443-44 (1980), *aff'd CCIA* v. *FCC*, 693 F.2d 198 (D.C. Cir. 1982).

[6] *See, e.g., PUC of Texas* v. *FCC*, 886 F.2d 1325, 1333-34 (D.C. Cir. 1989)(Silberman, J.); *California* v. *FCC*, 39 F.3d 919, 931-2 (9th Cir. 1994); *NARUC* v. *FCC*, 880 F.2d 422, 431 (D.C. Cir. 1989) (because it would be impracticable to have "'two separate phone systems with one being used wholly intrastate, unbundled cost-based pricing for a piece of equipment at the federal level necessarily precludes any other result by the states.'").

by imposing interconnection, unbundling, and resale duties on LECs and their long distance affiliates.[7] In the early 1990s, the FCC further sought to foster competition with the LECs' interstate exchange access services. It ordered LECs to unbundle their exchange access services by giving customers the choice of using some LEC network components and not others and stating separate prices for the different components. The FCC also ordered LECs to permit competing exchange access carriers to interconnect at specific points and to "co-locate" their facilities (either physically or "virtually") with those of the LEC at FCC-approved rates.[8] Under settled principles, new entrants would have had a right to use these same interconnection and co-location arrangements to provide intrastate exchange and exchange access services if they had been authorized under state law -- as they generally were not.

3. The Antitrust Decrees And Their Preemption Of State Regulation.

In 1974, the United States had filed a suit under the Sherman Act against the then-integrated Bell System. The suit charged that the Bell Operating Companies or "BOCs" (which collectively served 80% of the nation) had used their local monopolies to favor their then-affiliate AT&T and to impede competition in long distance and other markets.

The Justice Department presented detailed evidence that the

---

[7] *See, e.g., Specialized Common Carriers*, 29 F.C.C.2d 870 (1971); *Local Distribution Facilities*, 46 F.C.C.2d 413 (1974); *Resale and Shared Use*, 60 F.C.C.2d 261 (1976); *Private Line Interconnection*, 60 F.C.C.2d 939 (1976); *MTS and WATS Market Structure*, 81 F.C.C.2d 177 (1980); *Exchange Network Facilities for Interstate Access*, 90 F.C.C.2d 202 (1982).

[8] *See, e.g., Expanded Interconnection*, 7 F.C.C.R. 7369 (1992), *rev'd in part, Bell Atlantic* v. *FCC*, 24 F.3d 1441 (D.C. Cir. 1994)(holding the FCC then had no statutory authority to order physical co-location).

BOCs had discriminated against Bell System competitors in pricing and providing the essential facilities that the BOCs controlled. For example, the Department claimed that the BOCs had engaged in "price squeezes" against long distance competitors by imposing charges for monopoly exchange access services that were in excess of the economic cost that they and the Bell System's long distance affiliate incurred in using the same local facilities. *See United States* v. *AT&T*, 524 F. Supp. 1336, 1355, 1357, 1364-1370 (D.D.C. 1981). The Department also introduced evidence that the local exchanges are so complex and dynamic, and so dependent on the subjective judgment of the employees that manage them, that neither existing forms of utility regulation nor after-the-fact antitrust remedies could prevent these abuses.

In 1982, the Bell System consented to a Decree (the "MFJ") that granted the structural relief that the United States had sought. It required that the BOCs transfer their long distance facilities and other competitive assets to AT&T and that the reconstituted BOCs then be (1) divested from AT&T, (2) precluded from providing either interstate or intrastate long distance services (or manufacturing equipment) so long as they had local monopolies and (3) required to provide exchange access to providers of interstate and intrastate services on an unbundled basis under nondiscriminatory terms and conditions at cost-based rates (the "equal access" requirement). *United States* v. *AT&T*, 552 F. Supp. 131, 226-34 (D.D.C. 1982), *aff'd sub. nom. Maryland* v. *United States*, 460 U.S. 1001 (1983). An antitrust decree that contained the same equal access requirements, but less stringent separation requirements, was also entered against the nation's next largest LEC, GTE. *United States* v. *GTE Corp.*, 603 F. Supp. 730, 737-46 (D.D.C. 1984).

Over 30 States had intervened and opposed entry of the MFJ on jurisdictional grounds. They asserted that because the MFJ's requirements applied not only to interstate services but also to

intrastate services and the facilities used to provide them, the MFJ encroached upon the States' exclusive jurisdiction over intrastate services under § 2(b) of the Communications Act and violated the state action exception to the antitrust laws of *Parker* v. *Brown*, 317 U.S. 341 (1943), and its progeny. These States thus claimed both that the MFJ's requirements could not be implemented without their prior approval and that they would also have the authority to undo its requirements by ordering the divested BOCs to behave inconsistently with the MFJ's requirements with respect to intrastate services. The district court rejected these claims because the MFJ's provisions would promote competition in interstate services that were outside state regulation as well as any intrastate services that used the same BOC facilities. *See United States* v. *AT&T*, 552 F. Supp. at 153-160. This Court summarily affirmed these holdings. *Maryland* v. *United States*, 460 U.S. 1001 (1983).

Under the antitrust decrees and *Parker* v. *Brown*, States continued to control whether other carriers would be permitted to compete in the provision of intrastate exchange, intrastate exchange access, or intrastate long distance services. 552 F. Supp. at 159 n.117. However, when such services were authorized, the decrees' equal access requirements governed the LECs' provision of exchange access to the new entrants and preempted any inconsistent state regulations unless the antitrust decrees' provisions were waived. The decrees' equal access requirements were further held to prohibit a LEC from pricing and provisioning essential facilities in a manner that favored itself over competitors who provide local switching services, public telephone services, or any other authorized intrastate or interstate telecommunications services. *United States* v. *Western Elec. Co.*, 846 F.2d 1422, 1427-29 (D.C. Cir. 1988); *id.* 583 F. Supp. 1257 (D.D.C. 1984).

Further, federal courts had to rule on the BOCs' many requests for authority to provide long distance services under

the MFJ's standards, and were required to determine the sufficiency of state and federal regulations to eliminate the BOCs' monopoly power or to prevent its use to impede competition in long distance services. *United States* v. *Western Elec. Co.*, 673 F. Supp. 525, 544-546, 567-579 (D.D.C. 1987), *aff'd on this ground*, 900 F.2d 283, 289-92, 300-01 (D.C. Cir. 1990) (per curiam). Courts gave substantial deference to the Department of Justice on these questions, but no deference to the FCC or state regulators. See *id.*, 900 F.2d at 297-98.

4. The 1996 Act And Its Local Competition Provisions.

In the 1996 Act, Congress enacted a comprehensive scheme designed to (1) develop competition in local exchange and exchange access services and (2) relieve the BOCs from long distance restrictions only after local competition developed.

The provision of the Act that radically changes state and federal authority over telecommunications is § 253. It expressly invalidates any state law, regulation, or order that "prohibits" or has the "effect" of prohibiting any person from providing any telecommunications services. Section 253 thus assures that any firms that have obtained facilities and services that can be used to provide exchange services will have the right to do so. Correlatively, § 254 addresses the states' only legitimate reasons for having previously prohibited competition in intrastate local services. It adopts a new system in which surcharges will be imposed on all providers of telecommunications services to fund the costs of providing universal service to rural or other customers. Similarly, Congress also protected the States' historic interest in regulating rates of intrastate exchange and toll services to assure that they are not excessive.[9]

---

[9] No section of the Act deprives States of this authority, and by deciding (in the Conference Committee) to delete the language from the House and Senate (continued...)

The provisions that are directly at issue in this appeal are §§ 251 and 252, which require incumbent LECs to provide new entrants with additional facilities and capabilities needed to provide all or some of the services that LECs offer. In particular, they impose duties on all incumbent LECs (save those rural LECs who receive exemptions under § 251(f)) that are designed to allow new entrants to enter part of the local market in a limited way and to enter the entire market in one of two different ways.

The provision that allows limited immediate entry into part of the local telephone business is § 251(c)(4), which permits resale of LEC services. In particular, it allows new entrants to obtain the LECs' existing retail services at wholesale rates (computed by subtracting from the LECs' retail rates the costs that they avoid when services are provided only at wholesale), and then only to "resell" the LECs' own retail services in competition with them. Because § 251(c)(4) does not enable a new entrant to offer the "exchange access" services that represent over 20% of LECs' revenues, it only permits entry into part of the market.

Section 251 establishes two other modes of entry that allow new entrants to enter the entire local telephone market and to compete with the full range of services that LECs offer. Section 251(c)(2) allows a firm that has connected some individual customers to its own alternative local exchange facilities to interconnect with a LEC's network and exchange traffic with it. But because the time and expense of constructing redundant facilities is so great -- and its economics so uncertain -- it could not lead to broad based competition for years or decades.

---

[9] (...continued)
bills that made §§ 251-262 an exception to § 2(b), Congress assured that the FCC could not preempt state authority to regulate the rates for local exchange services, intrastate exchange access services, and intrastate long distance services on the "ancillary" and "protective" jurisdiction theories endorsed in *The Shreveport Rate Case*, 234 U.S. 342 (1914).

Most pertinently for present purposes, § 251(c)(3) requires LECs to provide access at rates, terms, and conditions that are just, reasonable, nondiscriminatory, and cost-based to any or all of the seven separate "network elements" that constitute the LECs' monopoly exchanges.[10] By authorizing new entrants to obtain access to network elements at cost, Congress intended to eliminate the insurmountable cost advantages that LECs would otherwise have by allowing new entrants to share in whatever economies of scale inhere in particular LEC facilities.

While these duties are subject to the general enforcement provisions of the Communications Act, the 1996 Act also adopts provisions designed to assure their rapid implementation. In particular, § 251(d)(1) required the FCC to adopt regulations to implement the requirements of § 251 by August 8, 1996. Section 252 further establishes a procedure and strict time deadlines through which competing carriers may obtain the interconnection arrangements that are required by § 251. Most pertinently, if negotiation fails to resolve all issues, § 252 entitles a new entrant to arbitrate "open issues" before the pertinent state commission if it is willing to do so or before the FCC if the state commission is not, and requires a decision in the arbitration within nine months of the beginning of the negotiations. §§ 252(b)(1), (b)(4)(C), (e)(4) & (e)(5).

In arbitrating open issues, state utility commissions and the

---

[10] The network consists of (1) a network interface device located at each customer's premises, (2) the local loop that connects the customer premises to a switch, (3) switches, (4) interoffice trunks ("transport facilities") that connect switches to one another, (5) operator and directory assistance systems that are connected to switches, (6) signaling systems that are connected to each switch, determine the most efficient path for each call to take and provide the necessary routing information to the switches, and (7) operations support systems that, among other things, direct those physical and logical connections among the foregoing elements that are required to establish and maintain telephone service for any customer.

FCC are required to ensure that their decisions "meet the requirements of § 251, including the regulations prescribed by the [FCC] pursuant to section 251." § 252(c)(1). When state commissions make determinations under this section, the Act provides that an aggrieved party may bring an action in an appropriate federal district court to determine whether the arbitrated agreement "meets the requirements of section 251 and this section [252]." § 252(e) (6).

Finally, the Act transfers jurisdiction to the FCC over provisions of the MFJ and GTE antitrust decrees. First, § 251(g) provides that the requirements of these decrees that the BOCs and GTE provide equal access to interstate and intrastate competitors on an unbundled basis and at cost-based rates are to be enforced as FCC regulations until the FCC adopts "supersed[ing]" regulations under § 251. Second, the 1996 Act also transferred to the FCC jurisdiction over the core of the MFJ's long distance and manufacturing restrictions on BOCs. Section 271 provides that the FCC cannot grant a BOC long distance authority in any State unless and until the FCC -- after giving "substantial weight" only to the Justice Department's evaluation (*see* § 271(d)(2)) -- "finds," among other things, that the BOC is offering access to unbundled network elements "in accordance with the [pricing and other] requirements of sections 251(c)(3) and 252(d)(1)" of the Act (§ 271(c)(2)(B)(ii)) and that the authorization is "consistent with the public interest." § 271(d)(3)(C).

5. The FCC's Local Competition Rules And The Decisions Under Review.

The FCC adopted rules to implement the local competition requirements of §§ 251 and 252 of the Act in two separate rulemaking orders that were issued on August 8, 1996. The LECs and a number of state utility commissions filed petitions for review of these orders, which were consolidated in the

Eighth Circuit. It initially stayed the FCC's "pricing" and so-called "pick and choose" regulations. Following briefing and argument, the Eighth Circuit vacated both sets of regulations and also a number of the FCC's other rules.

The Court held that the FCC lacked "jurisdiction" to adopt regulations to implement the pricing requirements of § 251(c) and § 252(d) that are critical to the statutory scheme, and it vacated FCC rules that, among other things, had prohibited States from establishing rates under methodologies that would foreclose competition through price squeezes. J.A. 147-171 (¶¶ 704-739). The Eighth Circuit also held that the FCC lacked jurisdiction over some of the Act's non-pricing requirements (*e.g.*, § 251(b)(3)'s duty of dialing parity). Because the Eighth Circuit believed that the FCC's authority over § 251 was limited to adopting rules that interpret the six subsections of § 251 that mention the FCC, the Eighth Circuit further vacated several of the FCC's nonpricing rules that did not interpret these terms. Pet. App. 46a, 50a-52a & 52a-53a.

The Eighth Circuit also invalidated two FCC rules that were adopted as interpretations of the Act's terms and found essential to the Act's implementation. Most critically, after initially upholding it and over the opposition of the state commissions, the Eighth Circuit, on rehearing, vacated the rule (47 C.F.R. § 51.315(b)) that provides that "an incumbent LEC shall not separate requested network elements" that LECs access in combined form. Pet. App. 71a. The Eighth Circuit also invalidated the FCC rule (§ 51.809(a)) that implements § 252(i) by allowing new entrants to obtain any facility or service under the same terms contained in any approved agreement -- without necessarily subscribing to the entire agreement.

Finally, four days before the petitions for certiorari were granted, the Eighth Circuit also issued a writ of mandamus that orders the FCC to defer to state pricing determinations when

ruling on a BOC's application for long distance authority under § 271 of the Act. Under this order, the FCC will be obligated to grant an application even when the FCC would independently conclude that BOCs are pricing essential facilities at artificially high levels that violate the requirements of §§ 251(c) and 252(d) and that also mean a BOC would defeat the "public interest" by engaging in a price squeeze against long-distance competitors. Although § 271 requires the FCC to deny applications in that circumstance and § 402(b)(6), (9) gives the D.C. Circuit exclusive jurisdiction over § 271 decisions, the Eighth Circuit ordered the FCC to defer to States to assure that its § 271 decisions do not have an "effect" on state pricing determinations under § 252. *Iowa Utils. Bd.* v. *FCC*, 135 F.3d 535, 543 (8th Cir. 1998), *petitions for certiorari pending*.

INTRODUCTION AND SUMMARY OF ARGUMENT

As amended by the 1996 Act, the Communications Act represents a comprehensive national scheme that both (1) protects the historic state interests that formerly led the States to prohibit or limit competition in intrastate local telephone services and (2) preempts all state law entry barriers and provides for the rapid implementation of new federal requirements to assure that new entrants may provide whatever forms of competing local telephone services are feasible.

The historic state interests are protected by two features of the Act that are not directly at issue in this case. Section 254 establishes a new mechanism that fully protects the States' historic policies of fostering "universal service" by creating a new system of explicit funding of any subsidized below-cost rates for rural and other customers. In particular, it requires the funding of universal service through "competitively neutral" surcharges on the revenues of all providers of telecommunications services, and § 254(f) permits individual States to increase those surcharges if they wish to fund greater

subsidies for specified customers. Section 254 thus eliminates the need for the prohibitions on competition which had been justified to assure that above-cost rates could be maintained for some services in order to fund the subsidies for other services.

At the same time, the Act protects the historic state interests of assuring that customers of intrastate services are not charged excessive rates. See p. 12, n.9, *supra*. Thus, while the local competition provisions of the Act allow new entrants to use their existing or newly-acquired service capabilities to offer intrastate exchange as well as interstate exchange access services, each state utility commission will maintain the ability to regulate all carriers' rates for all intrastate exchange, intrastate exchange access, and other intrastate services.

The revolutionary provision enacted by the 1996 Act is § 253, which preempts any state laws that prohibit or have the effect of prohibiting any firm from offering any intrastate or interstate telecommunications services. By itself, § 253 allows firms to use the capabilities that they acquired under earlier FCC regulations or antitrust consent decrees to offer intrastate exchange and exchange access services in any State, regardless of whether it is authorized by state law. Section 251(g) further gives the FCC jurisdiction over the equal access requirements of the MFJ and GTE antitrust decrees until such time as the FCC adopts "supersed[ing]" "regulations." Far more significantly, §§ 251 and 252 give new entrants additional access, interconnection, and resale rights and establish strict time tables and procedures designed rapidly to implement the new arrangements and to minimize entry costs for new entrants.

To apply the new federal requirements to local conditions, the Act allows for proceedings in 50 different States followed by federal district court actions. It is thus essential to the Act's goal of rapid implementation of the new federal requirements that there be federal regulations that define these requirements

in advance of the conclusion of the state proceedings and federal district court review. That is why § 251(d) requires the adoption of federal regulations to implement § 251's requirements within six months of the 1996 Act's enactment. Indeed, because state commission determinations are reviewable in federal courts which can give no deference to a state commission's interpretations of federal law, States will be reversed if they fail to follow the interpretation of the Act that best effectuates its terms and purposes. Thus, States have no legitimate interest in initially establishing prices and other terms of interconnection agreements on the basis of their own varying interpretations of federal requirements.

The decisions of the Eighth Circuit to vacate the FCC's critical rules wreak havoc on this carefully constructed scheme. The pricing and other rules that were vacated on jurisdictional grounds are within the FCC's explicit authority, and the rules that were vacated on the merits were compelled by the statute's terms, structure and purposes -- and were, in all events, reasonable. See *Chevron U.S.A., Inc.* v. *Natural Resources Defense Council, Inc.*, 467 U.S. 837, 842-45 (1984).

First, the Eighth Circuit's decision to vacate all the FCC's pricing and a number of its non-pricing rules on jurisdictional grounds is erroneous. Sections 201, 303, and other provisions of the Act unambiguously give the FCC authority to adopt rules to "carry out" all "the provisions" of the Act, not merely those involving "interstate services" and the six subsections of § 251 that allude to the FCC. Thus, § 251(d) required the adoption of rules implementing § 251 by August, 1996. Further, even if the FCC's general rulemaking authority were limited to interstate services, the jurisdiction over interstate services encompasses the arrangements at issue here in which new entrants obtain local loops and other facilities on an unseparated basis in order to provide interstate as well as intrastate services. Finally, because the FCC's authority under the Act is not limited to

construing the terms of six subsections of § 251, the Eighth Circuit's erroneous jurisdictional ruling also led it to apply an erroneous legal standard in reviewing the rules that it found the FCC had jurisdiction to adopt.

Second, the Eighth Circuit erred in vacating the FCC rule that provides that, except upon request, "an incumbent LEC shall not separate requested network elements that the incumbent LEC currently combines." This rule is compelled by the terms of § 251(c)(3), for it requires LECs to provide "nondiscriminatory access to network elements [in the plural] on an unbundled basis at any technically feasible point [in the singular]." § 251(c)(3). By its terms, the only way this duty can be discharged is if a new entrant can obtain access to combinations of elements at a single point, and it further would be manifest discrimination -- and impermissibly to raise a rival's costs -- for the LEC to access elements in their combined form, but require new entrants to incur the delay and costs of combining elements that LECs separate solely to frustrate competitors. As dictionaries, prior regulatory decisions, and LECs' own prior arguments establish, the Eighth Circuit is simply wrong that providing elements on an "unbundled" basis requires a LEC artificially to disconnect them from one another, and the FCC's interpretation was, in all events, a reasonable one under *Chevron*.

Third, the Eighth Circuit similarly had no basis to vacate the so-called "pick and choose" rule. It implements § 252(i)'s requirement that any firm may obtain individual elements on the same terms set forth in another interconnection agreement -- without necessarily subscribing to the entire contract.

I. THE FCC HAS AUTHORITY TO ADOPT RULES IMPLEMENTING §§ 251 AND 252.

The Eighth Circuit invalidated the FCC's regulations

implementing the pricing and many of the non-pricing requirements of §§ 251 and 252 on the ground that the FCC lacks "jurisdiction" over all the provisions of those sections and that the FCC's rulemaking authority is here limited to construing the terms of the six subsections of § 251 that refer to the FCC. On this basis, the Eighth Circuit vacated the FCC regulations defining (1) the LECs' and the arbitrators' obligations in pricing interconnections, network elements, wholesale rates for resale, and co-location arrangements under §§ 251(c) and 252(d) of the Act; (2) the LECs' duty to provide "dialing parity" under § 251(b)(3); (3) the LECs' duty to file contracts with other LECs under § 252(a)(1); (4) the conditions in which rural LECs can be exempted from § 251's duties under § 251(f); and (5) the FCC's authority under § 208 to decide complaints that either challenge the terms on which a LEC provides interconnection or that seek to enforce the LEC's duty to comply with its interconnection agreements.[11] Subsequent to the decisions under review here, the Eighth Circuit also held that, despite the terms of § 271(d), the FCC must defer to state pricing determinations in ruling on BOC applications for long distance authority. *Supra*, pp. 16-17.

These jurisdictional holdings rest on three grounds. First, the Eighth Circuit concluded that the "plain language" of the Act establishes that the FCC has authority to implement and enforce only those provisions of the Act that govern "interstate services" or that specifically mention the FCC. Second, it concluded that §§ 251 and 252 govern intrastate and not interstate services, and that § 2(b) of the Act would require the Eighth Circuit's jurisdictional holding even if the Act's terms were ambiguous. Third, although §§ 10, 208, 271, and other

---

[11] Because it believed that the FCC's authority over the rest of § 251 is limited to construing the terms of six subsections, the Eighth Circuit also vacated several rules (§§ 51.305(a), 311(c), 315(c)-(f) & 317) which were not adopted as interpretations of the Act's terms. *See* I.D, *infra*.

provisions of the Act both presume that the FCC has authority over all §§ 251's and 252's requirements and expressly grant the FCC the authority to interpret and apply these requirements in making other determinations, the Eighth Circuit held that these other provisions could and must be construed to deny this authority to the FCC in order to protect the States' jurisdiction.

Each of these three grounds is contrary to the unambiguous terms of the Act and its structure. Because §§ 251 and 252 unambiguously "apply" to the intrastate as well as the interstate aspects of the new arrangements and because the Act unambiguously "give[s]" the FCC "jurisdiction" over these provisions, the Eighth Circuit was also wrong in concluding that § 2(b)'s rule of construction supported its holdings.

A. Congress Vested the FCC With Regulatory Authority Over All Provisions of the Communications Act.

First, Congress unambiguously granted the FCC jurisdiction to adopt rules to implement all the requirements of §§ 251 and 252. It did so by expressly and deliberately codifying these and related provisions in Title II of the Communications Act (47 U.S.C. §§ 251-76). Congress thereby directed that these provisions would be enforced and administered in accordance with the Act's remedial and procedural provisions for which the FCC is responsible and accountable to Congress.[12]

Indeed, two separate provisions of the Communications Act expressly and unambiguously grant the FCC jurisdiction to

---

[12] Congress' decision to include the terms of §§ 251 and 252 within the FCC's organic statute was deliberate. Whereas Congress directed that new §§ 251-261 be inserted in the U.S. Code as amendments to the Communications Act, *see* § 101(a), Pub. L. 104-104, 110 Stat. at 61, Congress specified that other provisions of the 1996 Act would be codified in other titles of the U.S. code. § 601(b)(3), 110 Stat. at 143, § 701(b)(1), 110 Stat. at 147-48.

"prescribe such rules and regulations as may be necessary . . . to carry out the provisions of this Act." 47 U.S.C. §§ 201(b); *accord*, § 303(r). In addition, other provisions of the Act authorize the FCC not only to "enforce and execute" all "the provisions of this Act" (*id.* § 151; *accord*, § 208), but also to "perform any and all acts, make such rules and regulations, and issue such orders, not inconsistent with this Act, as may be necessary in the execution of its functions." *Id.* § 154(i). This Court has thus held that the FCC has authority to adopt any rule that is not inconsistent with the Act's provisions and that reasonably implements them.[13]

Further, the local competition provisions themselves establish that Congress understood that the FCC has the authority to issue regulations implementing all the provisions of §§ 251-76. Section 251(d) requires that "[w]ithin six months after [the date of enactment of the Telecommunications Act of 1996], the [FCC] shall complete all actions necessary to establish regulations to implement the requirements of this section."

The only way the Eighth Circuit could reach its different conclusion was by ignoring, or distorting, the plain language of each of the foregoing provisions. For example, the Eighth Circuit held that § 201(b) grants rulemaking authority over only "interstate . . . services" because the substantive standard contained in the first sentence of § 201(b) applies only to interstate services. Pet. App. 12a. But § 201(b)'s last sentence grants the FCC rulemaking authority over all "the provisions of this Act," not merely over the substantive "provisions of this Section." Indeed, the Eighth Circuit's attempt to limit this grant to the prohibition contained in the first sentence of § 201(b) is particularly spurious, for the remaining four sentences of this

---

[13] *National Broad. Co.* v. *FCC*, 319 U.S. 190, 216-220 (1943); *United States* v. *Southwestern Cable Co.*, 392 U.S. 157, 172-78 (1968); *FCC* v. *National Citizens Comm. For Broad.*, 436 U.S. 775, 793-94 (1978).

subsection all contain rules and prescriptions that, by their express terms, apply to the entire "Act." Further, there is even less substance to the Eighth Circuit's attempt to avoid § 303(r)'s independent and equally explicit grant of rulemaking authority.[14]

Similarly, the Eighth Circuit also had no grounds for dismissing § 251(d)'s requirement that the FCC adopt regulations implementing "the requirements of this section [251]" by August of 1996. Indeed, all the Eighth Circuit was able to say is that § 251(d)(1) "operates primarily as a time constraint" (Pet. App. 12a), which is an acknowledgment that it is at least "secondarily" a command that the FCC adopt rules implementing all § 251's requirements. That Congress *required* the FCC to adopt these rules is vivid confirmation that Congress understood and intended that the FCC would be *authorized* to adopt rules implementing all the Act's provisions.

Correlatively, there is no basis for the Eighth Circuit's conclusion that the FCC's rulemaking authority is limited to the six subsections of § 251 that mention the FCC: §§ 251(b)(2), (c)(4), (d)(2), (e), (h)(2) & (g). Four of these provisions mention the FCC to establish that its jurisdiction over a subject is exclusive and that States could not adopt supplemental "access and interconnection" regulations even if they were otherwise "consistent" with federal standards and did not

---

[14] Section 303(r) states that the FCC may "[m]ake such rules and regulations and prescribe such restrictions and conditions, not inconsistent with law, as may be necessary to carry out the provisions of this Act." Yet the Eighth Circuit held that § 303(r) "merely suppl[ied] the FCC with ancillary authority to issue regulations that may be necessary to fulfill its primary directives contained elsewhere in the statute." 120 F.3d at 795. Moreover, while the FCC rules at issue here implement explicit statutory requirements, this Court has elsewhere rejected the Eighth Circuit's conclusion by holding that the rulemaking authority conferred by § 303(r) is not limited "to those activities and forms of communication that are specifically described by the Act's other provisions." *Southwestern Cable*, 392 U.S. at 172, 181.

"substantially prevent implementation of . . . the purposes of [§§ 251-61]." § 251(d)(3); *compare* §§ 251(b)(2), (c)(4), (e), & (h)(2). The fifth of these provisions, § 251(d)(2), merely imposes conditions on the FCC's rulemaking authority by requiring the FCC to consider certain factors in defining network elements. Indeed, the fallacy of the Eighth Circuit's jurisdictional holding is demonstrated by the fact that it treated § 251(d)(2) as a "grant" of authority, when all it is is a statutory provision that imposes conditions on rulemaking authority granted by the Act's other provisions.

The remaining provision that mentions the FCC -- § 251(g) -- confirms the FCC's jurisdiction over all the pricing and non-pricing requirements. Section 251(g) gives the FCC jurisdiction over the MFJ and GTE antitrust decrees' "equal access" requirements that fully applied to all authorized intrastate services (see pp. 9-12, *supra*) -- including expressly those relating to "receipt of compensation." Because § 251(g) further requires that the FCC enforce these requirements as FCC regulations "until such restrictions and obligations are explicitly superseded by regulations prescribed by the Commission," it confirms that the FCC's authority to adopt "supersed[ing]" regulations under § 251 encompasses its pricing as well as its non-pricing requirements.

Indeed, the Eighth Circuit could not follow its own jurisdictional holding. It reviewed on the merits or upheld a number of rules that were outside the FCC's jurisdiction under the terms of its own decision: *e.g.*, the FCC's rules implementing the requirements of § 252(i) and the provisions of § 251 governing negotiation (§ 251(c)(1)), interconnection (§ 251(c)(2)), the terms and conditions under which network elements must be made available (§ 251(c)(3)), and co-location (§ 251(c)(6)). Quite plainly, the foregoing rules did not interpret §§ 251(b)(2), (c)(4), (d)(2), (e), (h)(2) or (g).

Finally, the Eighth Circuit believed that there is an additional textual basis for its holding that the FCC has no authority to adopt pricing rules: that is, the fact that § 252(c)(2) of the Act directs the States to establish prices in accord with the standards of § 252(d) and that neither provision refers to FCC regulations. Pet. App. 10a-14a. The short answer to this claim is that §§ 151, 154, 201, and 303 give the FCC authority to adopt rules to execute, enforce, and carry out all the provisions of the Act, including the provisions of §§ 252(c)(2) and 252(d) that direct States to "establish" specific rates that satisfy particular federal standards: *e.g.*, that network element rates be "based on the cost" of "providing" them "determined without reference to a rate-of-return or other rate-based proceeding."

In this regard, this Court has elsewhere held that a statutory provision that is far less explicit than those in the Communications Act had authorized another federal agency (there HHS) to adopt rules that bind States in setting rates under a federal statute even when, as is not the case here, the state bodies were directed to establish rates "determined in accordance with methods and standards *developed by the State[s].*" *Wilder* v. *Virginia Hosp. Ass'n*, 496 U.S. 498, 502-03, 515-17 (1990) (quoting statutory provision) (emphasis added). That reflects the breadth of the federal authority to "ensure compliance with the provision" of a federal statute even when the federal agency lacked the explicit rulemaking authority that the FCC has under § 201 and the other provisions of the Communications Act. *Id.* at 516.

In all events, the FCC would have explicit authority to adopt pricing rules even if its rulemaking authority were limited to implementing the requirements of § 251. For § 251(c) requires LECs to provide "wholesale rates for resale" and to provide "network elements" and "interconnections" at "rates" that are "just, reasonable, and nondiscriminatory" and "in accordance with . . the agreement and the requirements of this section and

section 252[(d)]." In addition, § 252(c)(1) requires States to adhere to FCC regulations that implement § 251's requirements when they resolve any "open issue" in an arbitration, and § 252(a)(1) requires parties to attempt to negotiate agreements containing "a detailed schedule of itemized charges" and to arbitrate the rates if there is no agreement. Finally, because the FCC has exclusive jurisdiction over some of the costs that can be included in the rates established under § 252(c) (see, *e.g.*, §§ 251(b)(2) & (e)), Congress necessarily intended that States establish rates by following FCC regulations as well as the requirements of § 252(d).

B. The Requirements Of §§ 251 And 252 Are Within The FCC's Jurisdiction Over Interstate Services.

The Eighth Circuit's jurisdictional holdings also rested on a second ground: that the requirements of §§ 251 and 252 are intrastate matters and are outside the FCC's jurisdiction over interstate services. However, as explained in the Statement of the Case, these provisions were enacted against the background of the uniform holdings that the FCC's authority over interstate services encompasses any subject that cannot feasibly be divided into interstate and intrastate components and separately regulated by state and federal authorities.

That is the ground on which the FCC had exclusive jurisdiction over private line networks and customer premises equipment and its interconnections to local networks prior to the 1996 Act. See pp. 5-9, *supra*. That ground fully applies to the new interconnection arrangements that are required by §§ 251 and 252. They permit new entrants to acquire interconnections and network elements (*e.g.*, the same leased local loop from a private line network) and use the elements to provide not only intrastate "exchange service" but also interstate "exchange access services" and other interstate services. While the rates for the services that the new entrants offer to the

public will be separately regulated by the States (for purely intrastate services) and by the FCC (for other services), the rates, terms, and conditions for the "wholesale" capacity that new entrants acquire from LECs and use to provide competing services are determined on a jurisdictionally unseparated basis. In particular, § 252 provides that a single body (either a state commission or the FCC) will, for example, establish a single rate, and single set of terms and conditions, governing a new entrant's lease of a local loop in Arlington, Virginia.

Contrary to the Eighth Circuit's apparent belief (Pet. App. 20a), it is irrelevant that the Act establishes a separations process for circumstances in which the FCC and the States establish separate rates for the interstate and intrastate calls placed over a local loop and other facilities in LEC networks. Where a single rate is established that governs both interstate and intrastate uses of a facility, there is no occasion for separations of investment and expenses, as settled law prior to 1996 established. *See* pp. 5-8, *supra*. Accordingly, in the local competition rulemaking proceedings before the FCC, not a single commentator argued that there was any basis for separating the interconnection arrangements into interstate and intrastate components, and there is no basis for upsetting the FCC's reasonable and well-supported determination that the matters are not severable. Pet. App. 194a-195a (¶ 92).

C. The Other Terms And Structure Of The Act Confirm That The FCC Has The Authority Both To Adopt Rules Defining The Pricing And Other Requirements Of Sections 251 And 252 And To Enforce Those Rules In Other Proceedings.

Finally, the Eighth Circuit also erroneously held that it could prevent "evasion" of the States' alleged jurisdiction over pricing and other matters by construing §§ 10, 208, 271 or other terms of the Act to deny the FCC authority to determine the legal

sufficiency of LEC prices and other conduct. The reality is that all the Act's other terms and structure independently establish that the Eighth Circuit's jurisdictional holding is wrong. They confirm that Congress intended that the FCC would adopt pricing and other rules to implement all the requirements of §§ 251 and 252 and that these rules would first be applied by States (or the FCC) in arbitrating interconnection arrangements and then would be applied in the §§ 10, 208, 271, and other proceedings that are within the FCC's exclusive jurisdiction.

First, the other provisions of the Act establish both that no legitimate state interest is served by requiring state commissions to follow the FCC rules governing only some of §§ 251 and 252's requirements and that the Eighth Circuit's jurisdictional holding is antithetical to the other terms and structure of the Act. Foremost, rather than incorporate provisions of state law on which state commissions would be entitled to deference, the Act explicitly adopts minimum federal standards to govern pricing and all other terms of interconnection arrangements and makes each state arbitration decision reviewable in federal district courts who cannot defer to a State's legal determinations. In this regard, even under the Eighth Circuit's holding, any state commission that fails to follow the interpretation of the federal requirements that best effectuates their terms and purposes will be reversed by a federal district court, a court of appeals, or this Court. Accordingly, the other provisions of the Act establish that a State's only possible legitimate interest is to be supplied with that interpretation in advance -- through FCC rules and a single judicial review proceeding -- not through *post hoc* litigation that can require a State to redo the arbitration.

Moreover, the inevitable effect of the Eighth Circuit's jurisdictional holding will be both to delay the Act's implementation in States that fail to adopt the correct interpretation of its provisions and to impose extraordinary

burdens on the federal courts that are now reviewing States' decisions in over 60 pending cases. However, each of these consequences is inconsistent with the Act's other terms and structure. The highly compressed time deadlines that § 252 establishes for the negotiation, arbitration, and approval of interconnection agreements -- and the requirement that the FCC issue implementing rules within six months -- forecloses any notion that Congress could have intended such delays and burdens, and the increased costs to new entrants that result.

In addition, still other provisions of the Act presume that the FCC has the enforcement and rulemaking authority that the Eighth Circuit denied it. For example, § 10 of the Act (47 U.S.C. § 160) generally authorizes the FCC to "forbear" from applying any provision of the Act to any carrier or service if it finds, among other things, that enforcement of the provision is not necessary to ensure that the charges are "just and reasonable and . . . [non]discriminatory." *Id.* § 160(a). Further, § 10(d) expressly provides that "the Commission may not forbear from applying the requirements of section 251(c) . . . under subsection (a) of this section, until it determines that those requirements have been fully implemented." §160(d). Congress could not have authorized the FCC to forbear from "applying" the requirements of § 251(c) unless the FCC had the authority to interpret and enforce § 251(c)'s pricing and other standards in the first place. The Eighth Circuit's attempt to argue otherwise ignores the text of § 10. See Pet. App. 86a-87a.

Moreover, other provisions of the Act expressly authorize the FCC to make the same determinations that the Eighth Circuit has held to be outside the FCC's jurisdiction, and the Eighth Circuit has responded to each by contorting the statutory language to limit the FCC's authority in order to prevent "evasion" of state jurisdiction. For example, § 208 expressly allows any party to file a complaint with the FCC that claims that a common carrier has violated any requirement of the Act,

including both the duty to provide the access arrangements required by § 251(c) and the duty to comply with any approved interconnection agreement under § 251(c)(2) & (3).

Because it feared that § 208 could allow the FCC directly to review the lawfulness of the LECs' charges and to enforce a state-approved interconnection agreement, the Eighth Circuit essentially rewrote the statute to protect the States' alleged exclusive jurisdiction. The Eighth Circuit "interpreted" the § 252(e)(6) remedy that entrants have against States as precluding § 208 and other enforcement actions against LECs. Further, the Eighth Circuit not only "construed" § 252 to give the States and the federal district courts the jurisdiction over the enforcement of interconnection agreements that the Act does not confer, but also held that this jurisdiction is exclusive. Finally, it also held that § 208 complaints can be filed only for claimed violations of requirements involving interstate services. Pet. App. 30a-34a. Each holding is contrary to the Act's text.

Similarly, § 271 of the Act provides that the FCC cannot authorize a BOC to provide long distance services to customers in a State unless the FCC "finds" that the BOC is, among other things, providing "access to network elements in accordance with the requirements of sections 251(c) and 252(d)(1)" (§ 271(c)(2)(B)(ii)) -- which is the same standard a federal district court must apply when it directly reviews a State's pricing determinations. § 252(e)(6). As the D.C. Circuit has held, § 271 provides that the FCC must conclude "to its own satisfaction" that the BOC has satisfied all "statutory requirements" for long-distance authority, and the FCC is not required "to give the State commissions' views any particular weight" in making that determination. *SBC Communications, Inc.* v. *FCC*, No. 97-1425, slip op. at 12-13 (D.C. Cir. March 20, 1998) (Silberman, J.). Although federal authorities had to assess the sufficiency of state approved arrangements under the MFJ in precisely these ways, the Eighth Circuit has (in a

subsequent order that is the subject of a separate petition for certiorari) required the FCC here to defer to state pricing determinations in order to assure that the "effect" of its § 271 jurisdiction is not to cause any State to follow the FCC's view of how the federal pricing requirements should be interpreted and implemented. *Supra*, pp. 8-9, 17.

Finally, while not discussed by the Eighth Circuit, § 253(d) authorizes the FCC to preempt any state order that "may" have the "effect" of prohibiting any entity from providing "any interstate or intrastate telecommunications service." By its terms, this provision gives the FCC authority over any state-authorized aspect of an interconnection arrangement. Indeed, while the FCC did not expressly invoke § 253 when it adopted its pricing rules, the FCC then found that the different pricing rules that some states have now adopted constitute such entry barriers. J.A. 147-162 (¶¶ 704-723).

In short, the other provisions of the Act vividly confirm what §§ 151, 154, 201, 251(d), and 303 make explicit. Congress intended that the FCC would adopt regulations defining all the requirements of §§ 251 and 252. Congress further intended that these regulations would be first applied by the States (or the FCC) in conducting arbitrations and then applied by the FCC in conducting proceedings under §§ 208, 253, 271, and other provisions of the Act.

D. Because Of Its Erroneous Jurisdictional Holding, The Eighth Circuit Applied The Wrong Standard in Reviewing Other Rules.

The Eighth Circuit's jurisdictional holding also caused it to apply an incorrect legal standard in reviewing those FCC rules that the Eighth Circuit found were within the FCC's jurisdiction. In particular, as this Court has repeatedly held, §§ 151, 154, 201, 251(d), and 303 authorize the FCC to adopt any rules that

are not inconsistent with the requirements of the Act and that reasonably implement its objectives. See pp. 23-24 & nn. 13-14, *supra*. But the Eighth Circuit did not apply this standard in reviewing the FCC's other rules, for the Eighth Circuit erroneously held that these statutory provisions were all inapplicable. Instead, the Eighth Circuit erroneously invalidated three separate sets of FCC rules on the ground that they did not rest on interpretations of the terms of the six subsections of § 251 that mention the FCC.

First, the Eighth Circuit vacated 47 C.F.R. § 51.317 which governs determinations of whether additional network elements must be made available by establishing a rebuttable presumption that if "it is technically feasible to unbundle a particular element," then "the element must be unbundled." Pet. App. 46. No claim was made that this rule frustrated the purposes of the Act or was inconsistent with any of its provisions. Instead, the Eighth Circuit vacated the rule (Pet. App. 46a) simply because there is "no reference to technical feasibility" in § 251(d)(2), which establishes some factors that the FCC must "at a minimum" consider "[i]n determining what network elements should be made available." That was plain error. The absence of any reference to technical feasibility in § 251(d)(2) does not prohibit the FCC from taking issues of technical feasibility into account in identifying network elements. Indeed, the Eighth Circuit's holding would produce the absurdity that the Act could permit or require the unbundling of a particular network capability even when that is technically infeasible.

Second, the Eighth Circuit vacated FCC rules that required incumbents to provide requesting carriers, for an additional charge, with "superior quality interconnection" or "access." Pet. App. 50a-52a (vacating Rules 51.305(a)(4) and 51.311(c)). The Eighth Circuit vacated these rules because the statute stated that access and interconnection must be "at least equal in quality" and could not be construed to *require* superior access.

Pet. App. 100a. Again, no claim was made that the rules were inconsistent with the Act's terms or purposes.

Third, the Eighth Circuit vacated Rules 51.315(c)-(f), which required LECs, upon request and again for additional compensation, to combine network elements with elements possessed by the new entrant or to combine their own network elements in a manner in which they are "not ordinarily combined" in the LECs' network. See Pet. App. 294a. The Eighth Circuit concluded that these rules were not authorized by the second sentence of § 251(c)(3) -- which requires LECs to provide network elements "in a manner that allows requesting carriers to combine" them -- because that sentence "indicates" that the new entrants "will combine the [] elements themselves." See Pet. App. 53a. But here, too, no claim was made that it was inconsistent with the Act's terms or purposes for the FCC to require LECs -- with their superior knowledge of and access to their networks -- to assume that task when requested and fully compensated.

In short, because of the Eighth Circuit's erroneous jurisdictional holding, it vacated pricing and certain non-pricing rules on the ground that they were outside the FCC's jurisdiction and vacated three sets of other rules by applying an incorrect legal standard. These aspects of the Eighth Circuit's judgment should be reversed, and the Eighth Circuit directed to review all these rules under the correct standard.

II. RULE 51.315(b) IMPLEMENTS § 251(c)(3)'s NONDISCRIMINATION REQUIREMENT AND IS CONSISTENT WITH THE UNIFORM DICTIONARY, JUDICIAL, AND REGULATORY DEFINITIONS OF "UNBUNDLED."

FCC Rule 51.315(b) provides that "[e]xcept upon request, an incumbent LEC shall not separate requested network elements

that the incumbent LEC currently combines." 47 C.F.R. § 51.315(b). That rule implements the requirement of § 251(c)(3) that new entrants receive "*nondiscriminatory* access to network elements on an unbundled basis at any technically feasible point on rates, terms, and conditions that are just, reasonable, and *nondiscriminatory*" (emphasis added). As the FCC has held, and as no party has challenged, "nondiscrimination" requires that LECs provide to new entrants the same quality of access to their facilities that the LECs receive themselves. *See* 47 C.F.R. § 51.313(b). Rule 51.315(b) implements that requirement by providing that an incumbent LEC must enable the new entrant to access network elements in combined form to serve a customer when (but only when) the LEC would access those elements in combined form if it were establishing the customer's service. Correlatively, it provides that, absent a request for greater separation, the LEC may separate elements provided to new entrants only to the extent that the elements are separated when the LEC accesses them to establish a customer's service.

This straightforward application of the nondiscrimination requirement is necessary to prevent conduct that would otherwise devastate the ability of new entrants to use network elements to compete with the LECs. Each of the seven network elements the FCC requires LECs to make available is always at least physically connected to, and accessed by the LEC in combination with, one or more of the other six elements. For example, the "loop," the wires that connect the customer's premises to the network, is connected at both ends to other network elements -- at one end to the switch, and at the other end to the "network interface device," a small box at the customer's home or business. If a LEC were permitted physically to disconnect these and other elements from each other before providing them to new entrants, it could render competition through network elements completely infeasible.

That is so for at least three reasons. First, a new entrant that signed up a new customer would incur the cost and delay of somehow obtaining access to the LEC's network and physically reconnecting the elements before it could actually provide service. This would be a powerful entry barrier that would destroy the economics of using network elements to provide competitive service, for, as the FCC found, the new entrant would then bear costs to provide service "that incumbent LECs would not incur" to provide the same service.[15] Second, such disassembly would create a powerful disincentive for any customer to switch service to the new entrant, for any that did so would suffer service outages of indefinite duration as the new entrant sought to reestablish up to six separate physical connections between the elements. Third, the costs and delay would also mean that a competitive carrier would be able as a logistical matter to fill orders from only a competitively trivial number of customers in a given year, thus foreclosing any prospect of widespread competition through network elements.[16] In each respect, the fundamental problem is the same: the new entrant would be forced to provide service at degraded quality and at higher cost than the LEC, and would therefore be denied the nondiscriminatory access that is essential to competition and required by § 251(c)(3).

That has been the precise result of the Eighth Circuit's

---

[15] *Local Competition*, Third Order on Reconsideration, 12 F.C.C.R. 12460, 12486, ¶ 44 (1997) (*pet. for rev. on other grounds pending*, No. 97-3389 (8th Cir.)) (J.A. 247-48).

[16] By contrast, when customers switch their long-distance service from one carrier to another, no such disconnection and reconnection of facilities is undertaken. The switchover is therefore quick and seamless, and customers switched long-distance carriers 53 million times in 1996. No such competitive outcome would be possible in local markets if LECs could require discriminatory physical recombinations of elements every time a customer attempted to switch away from the incumbent.

decision invalidating Rule 51.315(b). In the wake of that decision, the LECs announced that they would thereafter physically disconnect certain network element combinations before providing them to new entrants even when the LECs access those elements themselves in combined form. The LECs did so because combinations of network elements constitute the only entry vehicle that can permit the immediate, nationwide establishment of alternatives to the LECs' exchange and exchange access services, and they are particularly critical for providing competition for residential service.[17] Investment analysts have thus concluded that the Eighth Circuit's decision on rehearing "effectively has killed off local competition" in much of the local market.[18]

The Eighth Circuit's rehearing decision invalidated Rule 51.315(b) on three related grounds. First, it held that the term "unbundled" in § 251(c)(3)'s first sentence means "separated" or "uncombined." Pet. App. 71a. Second, the Eighth Circuit seemingly also relied on its previous holding that § 251(c)(3)'s second sentence -- "[a]n incumbent local exchange carrier shall provide such unbundled network elements in a manner that allows requesting carriers to combine" them -- "indicates that requesting carriers will combine the unbundled elements themselves." Pet. App. 53a. It concluded that this sentence must also authorize the incumbent LEC to separate network elements before providing the requesting carrier with access to them so that the requesting carrier can then "rebundle" them. *Id.* Finally, the Eighth Circuit stated that the FCC's rule would

---

[17] *See, e.g.*, Aff. of Joseph Gillan on Behalf of the Competitive Telecommunications Association, Ex. 1, *Petition of New York Tel for Approval of Statement of Generally Available Terms and Conditions*, 97-C-0271 (NY PSC) (90% of orders for unbundled network element combinations are to serve residential as opposed to business customers).

[18] *Court Ruling May Close Door on Leasing of Network Elements by CLECs*, Communications Today (Oct. 16, 1997).

destroy the Act's "careful distinctions" between unbundled network elements and resale. Pet. App. 71a.

Each holding is erroneous. Indeed, the FCC's interpretation of § 251(c)(3) is the only plausible construction of that section's terms. In any event, it is patently a permissible and reasonable interpretation to which the Eighth Circuit was required to defer. See, e.g., *Chevron USA, Inc.* v. *Natural Resources Defense Council, Inc.*, 467 U.S. 837 (1984).

A. "Unbundled" Does Not Mean "Disconnected."

The Eighth Circuit defined the term "unbundled," which appears in § 251(c)(3)'s first sentence, as the opposite of "combined," which appears in its second sentence. See Pet. App. 71a. The term "combine" in the second sentence means to "connect[]" two or more network elements so that they can be used to provide service. See *First Report*, Pet. App. 232a (¶ 294 n.620). Accordingly, the Eighth Circuit's holding was that LECs may "unbundle" network elements by disconnecting them.

1. That interpretation flies in the face of the plain statutory language, which clearly contemplates that new entrants will often obtain access to network elements in combinations. Section 251(c)(3) provides that LECs must provide access to "network *elements*" (in the plural) at any "technically feasible *point*" (in the singular). The only way a new entrant can access multiple elements at a single point is if those elements are provided in combination.

2. The Eighth Circuit's interpretation of "unbundled" is also foreclosed by the uniform dictionary, regulatory, and judicial definitions of the term -- none of which the Eighth Circuit even acknowledged. To provide something on an unbundled basis is not to disconnect it, but simply to state a separate price for it and to give users the option of declining to purchase it as part

of a package.

First, that is the dictionary definition. "Unbundle" is uniformly defined by dictionaries as "to separate the charges for related products or services usually offered as a package," with telephone service listed as an example.[19] That multiple dictionaries support the FCC's interpretation is itself conclusive of its reasonableness. See *National R.R. Passenger Corp.* v. *Boston & Me. Corp.*, 503 U.S. 407, 418-19 (1992).

Second, that was the meaning of the term "unbundled" in the 15 years of prior regulatory decisions that had directed LECs to provide other components of telephone service on an unbundled basis. In these decisions, the LECs' duty was to state a separate price for these components and to give customers the option of declining to obtain the unbundled component in combination with other LEC facilities or services. For example, in 1980, the LECs were required to "unbundle" telephone sets from the provision of local telephone service. That meant that LECs were required to price the two separately and give customers the option of replacing LEC telephones with those obtained from other sources. It did not mean that LECs visited the homes of customers who chose to continue leasing LEC telephones, disconnected them, and made the customers incur inconvenience and expense to reconnect them. See p. 8, *supra*.

The same rule applied when the FCC ordered the "unbundling"

---

Unab. 1987); *accord*, *Webster's New Collegiate Dictionary* (Merriam, 1981), at 1263 ("unbundle" is "to give separate *prices* for equipment and supporting services; to *price* separately") (emphases added); *American Heritage Dictionary*, at 1315 (2d Col. Ed. 1991) ("unbundling" is "[t]he separate pricing of goods and services").

of inside wire,[20] of features used to provide enhanced services,[21] and of dedicated transport, switched transport, and tandem switching.[22] And that is also how courts have uniformly used the term in other industries.[23] In all these contexts, to unbundle is to provide separate rates and choices for users, not to create inefficiencies for purchasers who order existing combinations.[24] Indeed, this Court has held that it violates the Sherman Act if a firm with market power acts with no "normal business purpose" and no "efficiency justification" to harm consumers and competitors. See *Aspen Skiing Co.* v. *Aspen Highlands Skiing Corp.*, 472 U.S. 585, 605-611 (1985).

[21] *Third Computer Inquiry*, 104 F.C.C.2d 958, 1064-66 (1986) ("unbundling" means that "competitors will pay only for Basic Service Elements that they use").

[22] *Expanded Interconnection*, 7 F.C.C.R. 7369 (1992) (dedicated transport); 8 F.C.C.R. 7374 (1993) (switched transport and tandem switching).

[23] *See, e.g., Northwest Pipeline Co.* v. *FERC*, 61 F.3d 1479, 1482 (10th Cir. 1995) (distinguishing "'bundled customers,' who are charged a unitary rate," and "'unbundled customers,'. . . who are charged separately for each component of service"); *Stinnett* v. *BellSouth*, 1993 U.S. Dist. LEXIS 21056, *6 (E.D. Tenn. March 3, 1993) ("unbundling". . . means that "charges [are] listed separately on a customer's bill"); *In re Data General Corp. Antitrust Lit.*, 490 F. Supp. 1089, 1105 (N.D. Cal. 1980) ("companies that market both software and CPUs make their software available on an 'unbundled' basis -- i.e., without also requiring the purchase of their own CPUs").

[24] Further, if Congress had regarded "unbundled" as the antonym of "combined," it presumably would have written the two sentences of § 251(c)(3) in parallel fashion -- either by requiring LECs to offer access to "*uncombined* network elements" or by requiring LECs to make unbundled network elements available "in a manner that enables requesting carriers to *bundle* them." Instead, Congress used different words because it was addressing different concepts.

Third, that was thus also the meaning of "unbundled" in the equal access requirements of the MFJ and GTE antitrust consent decrees that § 251(g) of the Act requires the FCC to enforce until it adopts "supersed[ing]" "regulations" under § 251. These provisions required the BOCs and GTE to provide all exchange access on an "unbundled . . . basis" at cost-based rates, which requires not that they pull apart network elements but that they file an "unbundled schedule [] of charges" and give carriers the option of using some elements but not others. See *United States* v. *AT&T*, 552 F. Supp. at 233; *United States* v. *GTE*, 603 F. Supp. at 743-46.

Indeed, this definition of "unbundled" is so widely understood that LECs themselves had urged its adoption at the FCC. In particular, in the Notice of Proposed Rulemaking that initiated this proceeding, the FCC provisionally defined "unbundling" as stating separate charges and providing the "ability" to obtain the component separately,[25] and the trade association of incumbent LECs endorsed this definition.[26] The FCC then incorporated that definition in a rule (§ 51.307(d)) and also adopted other rules reflecting the same understanding of unbundling.[27] These aspects of those other rules were not challenged before the Eighth Circuit. Indeed, it was only after the Eighth Circuit's first opinion revealed that the court had erroneously assumed that "unbundled" was the opposite of "combined" (Pet. App. 56a-57a) that the LECs seized on that notion, sought rehearing

---

[25] *Local Competition*, 11 F.C.C.R. 14171, 14200 ¶ 86 & n. 116 (1996) (quoting *Random House College Dictionary*, at 1428 (revised ed. 1980)).

[26] *See* Comments of United States Telephone Association, at 26 (May 16, 1996).

[27] For example, the FCC also adopted 47 C.F.R. 51.307(b) to make it explicit that new entrants can never be "prohibited from requesting two network elements that are connected to each other." *First Report*, ¶ 329 (Pet. App. 243a); *accord* §§ 51.319(e)(1); 51.319(e)(2)(iii) (Pet. App. 298-301).

to invalidate Rule 51.315(b), and converted the error into a holding.

3. Finally, the Eighth Circuit's definition is also at odds with other aspects of its own decision. For example, as the Eighth Circuit correctly noted, the Act "definitively declares" that signaling systems are network elements. Pet. App. 44a (citing 47 U.S.C. § 3(29)); see also 47 C.F.R. § 51.319(e). But signaling systems, like most network elements, are "shared" facilities. This means that new entrants and the incumbent LECs both use the same signaling facilities at the same time for all their customers, much as multiple employees in a single company often access and share the same central office computer. That further means that any act to disconnect those facilities from other network elements risks causing outages for all local exchange customers, both the LECs' customers and new entrants' customers.[28]

The engineering realities of telecommunications networks are thus wholly at odds with the Eighth Circuit's understanding of unbundling. Telecommunications networks consist of highly interdependent facilities and functionalities. As one FCC Commissioner explained, network elements cannot simply be "unplugged" from one another and then put "back together [by the new entrant] like pieces in a Lego play set."[29] The Eighth

---

[28] The LECs have therefore confined their separating to those elements that are not shared facilities, like the loop, so that they will impose outages only on the new entrants' customers.

[29] *See BellSouth Corp.*, 13 F.C.C.R. 539 (1997) (separate statement of Commissioner Powell). Indeed, this reality led that Commissioner to recommend complying with the Eighth Circuit's decision by having new entrants pay a "glue charge" to LECs in exchange for the LECs' merely leaving their network element combinations intact and thus "*simulat[ing]* the fiction of unbundling and rebundling." *Id.* (emphasis added). The suggestion that the only practical way to deal with the Eighth Circuit's decision is to require new

(continued...)

Circuit's erroneous interpretation of "unbundled" simply underscores the importance of respecting the "practical agency expertise [that] is one of the principal justifications behind *Chevron* deference." *Pension Benefit Guaranty Corp.* v. *LTV Corp.*, 496 U.S. 633, 651-52 (1990).

B. The Statutory Requirement That Incumbent LECs "Allow" New Entrants To Combine Elements Does Not Authorize LECs To Disconnect Elements.

The Eighth Circuit also adopted a related misconstruction of the second sentence of § 251(c)(3). That sentence provides: "An incumbent local exchange carrier shall provide such unbundled network elements in a manner that allows requesting carriers to combine such elements in order to provide such telecommunications service." In its initial decision, the Eighth Circuit had held that this sentence "could not be read to levy a duty on the incumbent LECs to do the actual combining of elements," but rather "indicates that requesting carriers will combine the unbundled elements themselves." Pet. App. 53a; *id.* ("the Act does not require incumbent LECs to do *all* of the work"). On that basis, the Eighth Circuit had invalidated Rules 51.315(c)-(f), which had required LECs, upon request by a new entrant and for compensation, to combine network elements that were *not* already combined -- *e.g.*, to combine LEC network elements with the new entrant's facilities, or to combine LEC network elements with other LEC network elements in ways in which they are not "ordinarily combined in the incumbent LEC's network." Pet. App. 53a, 294a.

On rehearing, the Eighth Circuit extended that holding by also

---

[29] (...continued)
entrants to pay protection money for a completely non-existent "rebundling" service underscores how far the Eighth Circuit's holding departed from any rational understanding of the Act.

invalidating Rule 51.315(b), even though it, in contrast to Rules 51.315(c)-(f), did not remotely "levy a duty" on LECs "to do the actual combining of elements." To the contrary, Rule 51.315(b) applied only to elements that are already combined, so LECs did not have to do any "work" to comply with it, but merely to refrain from affirmative acts of sabotage.

However, by vacating Rule 51.315(b), the Eighth Circuit effectively read the second sentence's command that LECs "allow" new entrants to combine elements as (a) applying to elements that were already combined, and (b) providing that new entrants would not only be "allow[ed]", but also that they could be required, to establish connections between all elements they purchase. It therefore held that LECs could disconnect elements before providing them to new entrants even when the LECs access those elements for themselves in combined form.

The Eighth Circuit fundamentally misread the Act. The second sentence of § 251(c)(3) imposes a requirement not on new entrants, but on LECs, and that requirement is in addition to the LECs' duties under the first sentence. Thus, the first sentence requires, *inter alia*, that LECs provide nondiscriminatory access to network elements (*i.e.*, in the same form as the LECs access them), and that such access be provided at "any technically feasible point." In addition, even after they comply with those obligations, the LECs still have the duty under the second sentence to provide access at that "technically feasible point" in a manner that allows new entrants to combine the elements.

This obligation of the second sentence is part of the statutory scheme because LECs may lawfully separate elements in at least two circumstances. First, Rule 51.315(b) permits LECs to separate elements for new entrants "upon request." Thus, for example, a new entrant may seek to use a facility of its own (such as a switch) in combination with a LEC's facilities, and

will then exercise its statutory right to obtain access "at any technically feasible point" by interconnecting its switch with the LEC's loop. In order for the new entrant to establish that interconnection, the LEC must first physically separate the LEC's loop from the LEC's switch. Similar physical separation can be necessary when other facilities are substituted by the new entrant for the LEC's facilities. The second sentence requires that, in such situations, the LECs provide their network elements in a manner that enables the new entrant to accomplish the combining. Indeed, the LECs argued, and the Eighth Circuit held, that the second sentence of § 251(c)(3) directly addresses this situation among others. Pet. App. 52a-53a.

Second, the obligation imposed by the second sentence is also important because, even when the new entrant has not requested separation, the first sentence of § 251(c)(3) permits the LECs to provide elements to new entrants in separated form to whatever extent the LECs separate those network elements when they access the elements. When they do so, § 251(c)(3) again requires that the LECs provide new entrants with access "at any technically feasible point" and "in a manner that allows" the new entrants to "combine" the elements.

In that regard, while LECs do not physically disconnect network elements when they access those elements themselves, they do sometimes disconnect elements "logically" through their "operations support systems" ("OSS"). OSS are the computer systems that the LECs use, among other purposes, to send software instructions through the network directing how their facilities are to be used to provide service, and those systems constitute one "technically feasible point" at which new entrants can access network elements. When LECs disconnect network elements in the course of their own use, they do so logically by making software changes through their OSS, rather than by

physically pulling the pieces of equipment apart.[30] The FCC held that § 251(c)(3)'s nondiscrimination requirement applies to both "physical and logical connections" to adjacent elements (*First Report*, ¶ 312 (J.A. 56-57)), and to the extent that the LECs logically separate network elements for themselves, the LECs may likewise logically separate those elements for new entrants. However, under the second sentence of § 251(c)(3) the LECs must also then enable the new entrant to access the OSS to recombine those elements in the same way LECs do.

By contrast, if the Eighth Circuit read the second sentence to mandate disconnection in all instances, that construction is insupportable in at least three respects. First, as with the Eighth Circuit's related interpretation of "unbundled," it interprets one portion of § 251(c)(3) to authorize the discrimination that § 251(c)(3) elsewhere prohibits. Second, it ignores that the second sentence is framed exclusively as a duty of incumbent LECs to "allow" new entrants to combine elements, rather than a grant to LECs of a right to force new entrants to do such combining. Third, the Eighth Circuit's construction defeats the procompetitive purposes of the Act, for it authorizes incumbent LECs to separate elements solely to raise their rivals' costs.

C. The Eighth Circuit's Assertion That Rule 51.315(b) Should Be Invalidated To "Preserve" Resale As An "Attractive" Entry Vehicle Is Baseless.

Finally, the Eighth Circuit also justified its definition of

---

[30] For example, when a LEC customer moves out of his or her home and terminates his or her local phone service, the LEC does not physically pull that customer's loop off the switch. Instead, it uses its OSS to send a message to a database associated with the former customer's switch instructing it to terminate service for that loop. Although the loop and the switch remain physically connected, they are then logically disconnected and that loop-switch combination will be inoperable, and the customer unable to make or receive phone calls, unless and until a different software instruction is sent.

"unbundled" by asserting that the FCC's contrary definition would "obliterate" the Act's "careful distinctions" between unbundled network elements and resale. Pet. App. 71a. The Eighth Circuit appeared to believe that unless it substantially and artificially increased the costs of obtaining unbundled network element combinations by permitting LECs to separate them, "all requesting carriers [would] select unbundled access over resale as their preferred route to enter the local telecommunications market," and that construing "unbundled" as "uncombined" was therefore necessary to "preserve resale" as an "attractive option." Pet. App. 56a-57a. This analysis was fundamentally misguided, both legally and factually.

First, there was no legal basis for the Eighth Circuit's effort to ensure that resale remained comparatively attractive to new entrants by making unbundled elements difficult to use. As the FCC found, Congress' purpose in establishing three different entry vehicles was to create alternative paths that new entrants with different business plans could employ "as market conditions and access to capital permit." Pet. App. 137a-138a (¶ 12). Congress could not at that time know, and did not presume to know, which entry vehicles would ultimately prove most successful or be used most often, and certainly did not instruct courts to create artificial obstacles to one vehicle in order to enhance the appeal of another.

Second and in any event, even if the issue were relevant there was never any prospect that Rule 51.315(b) would lead all new entrants to purchase network elements and that the resale option would thereby be nullified. The FCC made detailed findings on this very point in the same order in which it adopted Rule 51.315(b). It explained that these entry vehicles present different costs, different risks, and different opportunities; that new entrants select one or the other based on a range of factors, including the markets they seek to enter, the particular services they seek to provide, and their willingness to assume risk; and

that there is no prospect that the availability of network element combinations will mean that no carrier engages in resale. Pet. App. 244a-246a. These findings were eminently reasonable, supported by a voluminous record, and well within the FCC's expertise, and the Eighth Circuit had no legitimate basis for concluding that it needed to impose additional burdens on purchasers of network elements to make resale more attractive.

Finally, even if Congress had thought it important to ensure that resale be a comparatively attractive entry option and the FCC's factual findings had been found erroneous, the most the Eighth Circuit could have concluded was that §§ 251(c)(3) and 251(c)(4) embodied partially conflicting policies. However, the "principle of deference to administrative interpretations" is highest "'whenever decision as to the meaning or reach of a statute has involved reconciling conflicting policies.'" *Chevron*, 467 U.S. at 844 (citation omitted). In short, the Eighth Circuit fundamentally misperceived its role as a reviewing court when it invalidated Rule 51.315(b). It improperly rested its decision on an unprecedented definition of an established term and on uninformed and inaccurate economic and factual speculations that are contrary to well-reasoned conclusions of the federal agency responsible for the Act's implementation.

III. THE FCC's CONSTRUCTION OF § 252(i) IS CORRECT, AND IN ALL EVENTS REASONABLE UNDER *CHEVRON*.

Section 252(i) requires an incumbent LEC to "make available *any* interconnection, service or network element provided *under* an agreement . . . to which it is a party to any other requesting telecommunications carrier upon the same terms and conditions as those provided in the agreement." 47 U.S.C. § 252(i) (emphasis added). The FCC interpreted this "most favored nation" provision in light of its language and evident purpose, and concluded that it required incumbents to make available

"any individual interconnection, service, or network element arrangement contained in an agreement" under all of the "terms and conditions [that] legitimately relate[] to the purchase of the individual element being sought." Pet. App. 261a, 264a, 336a.

The Eighth Circuit vacated this rule, holding that § 252(i) requires incumbents to make available only agreements in their totality, rather than individual elements provided under an agreement. Pet. App. 27a. That holding conflicts with § 252(i)'s language, history and purposes and is based on a misapprehension of the rule's operation.

The FCC correctly concluded that § 252's terms draw a clear "distinction between 'any interconnection, service, or network elements provided under an agreement,' which the statute lists individually, and agreements in their totality." Pet. App. 261a-262a. Section 252(i) was thus designed to "prevent discrimination . . . by making available to other carriers *the individual elements* of agreements that have been previously negotiated." S. Rep. No. 104-23, at 22 (1995) (emphasis added).

Indeed, the terms of the FCC's rule are virtually identical to the language of § 252(i). The Eighth Circuit thus agreed that § 252(i)'s terms "could indicate that the FCC's approach was intended by Congress." Pet. App. 25a n.22. Under *Chevron*, that should have ended the matter. However, the Eighth Circuit vacated the rule because it believed that the Act "reveal[ed]" a "preference" for negotiation over arbitration and that the FCC's rule would "thwart the negotiation process" by permitting requesting carriers to "receive [a] concession without having to grant . . . the corresponding benefit." Pet. App. 26.

But these conclusions were baseless. First, the Act does not embody any overriding preference for negotiations. It establishes a short, four-month period in which LECs and their

potential competitors can attempt to negotiate agreements, and then provides for binding agency arbitrations whenever those negotiations fail to reach agreement. See § 252(b).

Second, in any event, the FCC's rule would not thwart any legitimate "give-and-take process" of negotiation. Pet. App. 26a. Under that rule, a requesting carrier must purchase a service or element under *all* the terms of the agreement that "legitimately relate" to that service or element. Thus, for example, where there has been legitimate give and take with the first carrier -- such as where an incumbent makes the terms of one element expressly conditional on the requesting carrier's agreement to purchase a defined amount of another element at that element's terms -- then a subsequent carrier would have to accept both the "benefit" as well as the "concession."

By contrast, the Eighth Circuit's reading of § 252(i) would require the subsequent carrier to take not only the terms that are tied to an individual service or element, but the entire agreement. That holding would thus permit an incumbent LEC to discriminate among new entrants, and to prevent any carrier from invoking its § 252(i) rights, merely by "insert[ing] into its agreement onerous terms for a service or element that the original carrier does not need," and therefore would not actually purchase, "in order to discourage subsequent carriers [that do need that service or element] from making a request under that agreement." Pet. App. 262a.

CONCLUSION

For the reasons stated, the Eighth Circuit's decisions should be reversed insofar as they vacate FCC rules.

Respectfully submitted,

APPENDIX

RELEVANT STATUTORY PROVISION

47 U.S.C. § 271

§ 271. Bell operating company entry into interLATA services

(a) General limitation

Neither a Bell operating company, nor any affiliate of a Bell operating company, may provide interLATA services except as provided in this section.

(b) InterLATA services to which this section applies

(1) In-region services

Bell operating company, or any affiliate of that Bell operating company, may provide interLATA services originating in any of its in-region States (as defined in subsection (i) of this section) if the Commission approves the application of such company for such State under subsection (d)(3) of this section.

(2) Out-of-region services

A Bell operating company, or any affiliate of that Bell operating company, may provide interLATA services originating outside its in-region States after February 8, 1996, subject to subsection (j) of this section.

(3) Incidental interLATA services

A Bell operating company, or any affiliate of a Bell operating company, may provide incidental interLATA services (as defined in subsection (g) of this section) originating in any State after February 8, 1996.

(4) Termination

Nothing in this section prohibits a Bell operating company or any of its affiliates from providing termination for interLATA services, subject to subsection (j) of this section.

(c) Requirements for providing certain in-region interLATA services

(1) Agreement or statement

A Bell operating company meets the requirements of this paragraph if it meets the requirements of subparagraph (A) or subparagraph (B) of this paragraph for each State for which the authorization is sought.

(A) Presence of a facilities-based competitor

A Bell operating company meets the requirements of this subparagraph if it has entered into one or more binding agreements that have been approved under section 252 of this title specifying the terms and conditions under which the Bell operating company is providing access and interconnection to its network facilities for the network facilities of one or more unaffiliated competing providers of telephone exchange service (as defined in section 153(47)(A) of this title, but excluding exchange access) to residential and business subscribers. For the purpose of this subparagraph, such telephone exchange service may be offered by such competing

providers either exclusively over their own telephone exchange service facilities or predominantly over their own telephone exchange service facilities in combination with the resale of the telecommunications services of another carrier. For the purpose of this subparagraph, services provided pursuant to subpart K of part 22 of the Commission's regulations (47 C.F.R. 22.901 et seq.) shall not be considered to be telephone exchange services.

(B) Failure to request access

A Bell operating company meets the requirements of this subparagraph if, after 10 months after February 8, 1996, no such provider has requested the access and interconnection described in subparagraph (A) before the date which is 3 months before the date the company makes its application under subsection (d)(1) of this section, and a statement of the terms and conditions that the company generally offers to provide such access and interconnection has been approved or permitted to take effect by the State commission under section 252(f) of this title. For purposes of this subparagraph, a Bell operating company shall be considered not to have received any request for access and interconnection if the State commission of such State certifies that the only provider or providers making such a request have (i) failed to negotiate in good faith as required by section 252 of this title, or (ii) violated the terms of an agreement approved under section 252 of this title by the provider's failure to comply, within a reasonable period of time, with the implementation schedule contained in such agreement.

(2) Specific interconnection requirements

(A) Agreement required

A Bell operating company meets the requirements of this paragraph if, within the State for which the authorization is sought–

(i)(I) such company is providing access and interconnection pursuant to one or more agreements described in paragraph (1)(A), or

(II) such company is generally offering access and interconnection pursuant to a statement described in paragraph (1)(B), and

(ii) such access and interconnection meets the requirements of subparagraph (B) of this paragraph.

(B) Competitive checklist

Access or interconnection provided or generally offered by a Bell operating company to other telecommunications carriers meets the requirements of this subparagraph if such access and interconnection includes each of the following:

(i) Interconnection in accordance with the requirements of sections 251(c)(2) and 252(d)(1) of this title.

(ii) Nondiscriminatory access to network elements in accordance with the requirements of sections 251(c)(3) and 252(d)(1) of this title.

(iii) Nondiscriminatory access to the poles, ducts, condu-

its, and rights-of-way owned or controlled by the Bell operating company at just and reasonable rates in accordance with the requirements of section 224 of this title.

(iv) Local loop transmission from the central office to the customer's premises, unbundled from local switching or other services.

(v) Local transport from the trunk side of a wireline local exchange carrier switch unbundled from switching or other services.

(vi) Local switching unbundled from transport, local loop transmission, or other services.

(vii) Nondiscriminatory access to--

(I) 911 and E911 services;

(II) directory assistance services to allow the other carrier's customers to obtain telephone numbers; and

(III) operator call completion services.

(viii) White pages directory listings for customers of the other carrier's telephone exchange service.

(ix) Until the date by which telecommunications numbering administration guidelines, plan, or rules are established, nondiscriminatory access to telephone numbers for assignment to the other carrier's telephone exchange service customers. After that date, compliance with such guidelines, plan, or rules.

(x) Nondiscriminatory access to databases and associated signaling necessary for call routing and completion.

(xi) Until the date by which the Commission issues regulations pursuant to section 251 of this title to require number portability, interim telecommunications number portability through remote call forwarding, direct inward dialing trunks, or other comparable arrangements, with as little impairment of functioning, quality, reliability, and convenience as possible. After that date, full compliance with such regulations.

(xii) Nondiscriminatory access to such services or information as are necessary to allow the requesting carrier to implement local dialing parity in accordance with the requirements of section 251(b)(3) of this title.

(xiii) Reciprocal compensation arrangements in accordance with the requirements of section 252(d)(2) of this title.

(xiv) Telecommunications services are available for resale in accordance with the requirements of sections 251(c)(4) and 252(d)(3) of this title.

(d) Administrative provisions

(1) Application to Commission

On and after February 8, 1996, a Bell operating company or its affiliate may apply to the Commission for authorization to provide interLATA services originating in any in-region State. The application shall identify each State for which the authorization is sought.

(2) Consultation

(A) Consultation with the Attorney General

The Commission shall notify the Attorney General promptly of any application under paragraph (1). Before making any determination under this subsection, the Commission shall consult with the Attorney General, and if the Attorney General submits any comments in writing, such comments shall be included in the record of the Commission's decision. In consulting with and submitting comments to the Commission under this paragraph, the Attorney General shall provide to the Commission an evaluation of the application using any standard the Attorney General considers appropriate. The Commission shall give substantial weight to the Attorney General's evaluation, but such evaluation shall not have any preclusive effect on any Commission decision under paragraph (3).

(B) Consultation with State commissions

Before making any determination under this subsection, the Commission shall consult with the State commission of any State that is the subject of the application in order to verify the compliance of the Bell operating company with the requirements of subsection (c) of this section.

(3) Determination

Not later than 90 days after receiving an application under paragraph (1), the Commission shall issue a written determination approving or denying the authorization requested in the application for each State. The Commission shall not approve the authorization requested in an application

submitted under paragraph (1) unless it finds that—

(A) the petitioning Bell operating company has met the requirements of subsection (c)(1) of this section and—

(i) with respect to access and interconnection provided pursuant to subsection (c)(1)(A) of this section, has fully implemented the competitive checklist in subsection (c)(2)(B) of this section; or

(ii) with respect to access and interconnection generally offered pursuant to a statement under subsection (c)(1)(B) of this section, such statement offers all of the items included in the competitive checklist in subsection (c)(2)(B) of this section;

(B) the requested authorization will be carried out in accordance with the requirements of section 272 of this title; and

(C) the requested authorization is consistent with the public interest, convenience, and necessity.

The Commission shall state the basis for its approval or denial of the application.

(4) Limitation on Commission

The Commission may not, by rule or otherwise, limit or extend the terms used in the competitive checklist set forth in subsection (c)(2)(B) of this section.

(5) Publication

Not later than 10 days after issuing a determination under paragraph (3), the Commission shall publish in the Federal Register a brief description of the determination.

(6) Enforcement of conditions

(A) Commission authority

If at any time after the approval of an application under paragraph (3), the Commission determines that a Bell operating company has ceased to meet any of the conditions required for such approval, the Commission may, after notice and opportunity for a hearing—

(i) issue an order to such company to correct the deficiency;

(ii) impose a penalty on such company pursuant to title V; or

(iii) suspend or revoke such approval.

(B) Receipt and review of complaints

The Commission shall establish procedures for the review of complaints concerning failures by Bell operating companies to meet conditions required for approval under paragraph (3). Unless the parties otherwise agree, the Commission shall act on such complaint within 90 days.

(e) Limitations

(1) Joint marketing of local and long distance services

Until a Bell operating company is authorized pursuant to subsection (d) of this section to provide interLATA services in an in-region State, or until 36 months have passed since February 8, 1996, whichever is earlier, a telecommunications carrier that serves greater than 5 percent of the Nation's presubscribed access lines may not jointly market in such State telephone exchange service obtained from such company pursuant to section 251(c)(4) of this title with interLATA services offered by that telecommunications carrier.

(2) IntraLATA toll dialing parity

(A) Provision required

A Bell operating company granted authority to provide interLATA services under subsection (d) of this section shall provide intraLATA toll dialing parity throughout that State coincident with its exercise of that authority.

(B) Limitation

Except for single-LATA States and States that have issued an order by December 19, 1995, requiring a Bell operating company to implement intraLATA toll dialing parity, a State may not require a Bell operating company to implement intraLATA toll dialing parity in that State before a Bell operating company has been granted authority under this section to provide interLATA services originating in that State or before 3 years after February 8, 1996, whichever is

earlier. Nothing in this subparagraph precludes a State from issuing an order requiring intraLATA toll dialing parity in that State prior to either such date so long as such order does not take effect until after the earlier of either such dates.

(f) Exception for previously authorized activities

Neither subsection (a) of this section nor section 273 of this title shall prohibit a Bell operating company or affiliate from engaging, at any time after February 8, 1996, in any activity to the extent authorized by, and subject to the terms and conditions contained in, an order entered by the United States District Court for the District of Columbia pursuant to section VII or VIII(C) of the AT&T Consent Decree if such order was entered on or before February 8, 1996, to the extent such order is not reversed or vacated on appeal. Nothing in this subsection shall be construed to limit, or to impose terms or conditions on, an activity in which a Bell operating company is otherwise authorized to engage under any other provision of this section.

(g) Definition of incidental interLATA services

For purposes of this section, the term "incidental interLATA services" means the interLATA provision by a Bell operating company or its affiliate—

(1)(A) of audio programming, video programming, or other programming services to subscribers to such services of such company or affiliate;

(B) of the capability for interaction by such subscribers to select or respond to such audio programming, video programming, or other programming services;

(C) to distributors of audio programming or video programming that such company or affiliate owns or controls, or is licensed by the copyright owner of such programming (or by an assignee of such owner) to distribute; or

(D) of alarm monitoring services;

(2) of two-way interactive video services or Internet services over dedicated facilities to or for elementary and secondary schools as defined in section 254(h)(5) of this title;

(3) of commercial mobile services in accordance with section 332(c) of this title and with the regulations prescribed by the Commission pursuant to paragraph (8) of such section;

(4) of a service that permits a customer that is located in one LATA to retrieve stored information from, or file information for storage in, information storage facilities of such company that are located in another LATA;

(5) of signaling information used in connection with the provision of telephone exchange services or exchange access by a local exchange carrier; or

(6) of network control signaling information to, and receipt of such signaling information from, common carriers offering interLATA services at any location within the area in which such Bell operating company provides telephone exchange services or exchange access.

(h) Limitations

The provisions of subsection (g) of this section are intended to be narrowly construed. The interLATA services provided

under subparagraph (A), (B), or (C) of subsection (g)(1) of this section are limited to those interLATA transmissions incidental to the provision by a Bell operating company or its affiliate of video, audio, and other programming services that the company or its affiliate is engaged in providing to the public. The Commission shall ensure that the provision of services authorized under subsection (g) of this section by a Bell operating company or its affiliate will not adversely affect telephone exchange service ratepayers or competition in any telecommunications market.

(i) Additional definitions

As used in this section—

(1) In-region State

The term "in-region State" means a State in which a Bell operating company or any of its affiliates was authorized to provide wireline telephone exchange service pursuant to the reorganization plan approved under the AT&T Consent Decree, as in effect on the day before February 8, 1996.

(2) Audio programming services

The term "audio programming services" means programming provided by, or generally considered to be comparable to programming provided by, a radio broadcast station.

(3) Video programming services; other programming services

The terms "video programming service" and "other programming services" have the same meanings as such terms

have under section 522 of this title.

(j) Certain service applications treated as in-region service applications

For purposes of this section, a Bell operating company application to provide 800 service, private line service, or their equivalents that—

(1) terminate in an in-region State of that Bell operating company, and

(2) allow the called party to determine the interLATA carrier,

shall be considered an in-region service subject to the requirements of subsection (b)(1) of this section.

LIST OF PARTIES AND AFFILIATES

The parties to the proceedings in the Eighth Circuit are listed in Pet. App. at 1a-4a, 73a-79a and 92a.

Pursuant to Rule 29.6 of the Supreme Court Rules, the Rural Telephone Coalition ("RTC") and United States Telephone Association ("USTA") respectfully submit these disclosure statements.

RTC is comprised of the National Rural Telecom Association ("NRTA"), the National Telephone Cooperative Association ("NTCA"), and the Organization for the Promotion and Advancement of Small Telecommunications Companies ("OPASTCO"). Each of the associations in the RTC is a non-profit trade association representing the interest of facilities-based local exchange and exchange access providers. These companies are full members of the associations. Some of the associations also have international members who provide local exchange services in other jurisdictions, and associate members consisting of consultants, manufacturers, and other parties with interests in the local exchange carrier industry. Neither the RTC nor any of the associations have any parent companies, subsidiaries, or affiliates for whom disclosure is required by Rule 29.6.

USTA is a non-profit trade association representing the interest of facilities-based local exchange and exchange access providers. These companies are its full members. USTA also has international members who provide local exchange services in other jurisdictions, and associate members including consultants, manufacturers, banks and investors, and other parties with interests in the local exchange carrier industry. USTA has no parent companies, subsidiaries, or affiliates for whom disclosure is required by Rule 29.6.

CONSOLIDATED BRIEF FOR RESPONDENTS UNITED STATES TELEPHONE ASSOCIATION AND THE RURAL TELEPHONE COALITION

STATEMENT OF THE CASE

Respondent United States Telephone Association ("USTA") is a non-profit trade association that represents the interests of more than 1,000 facilities-based local exchange and exchange access providers, most of which are small and mid-sized local exchange carriers ("LECs"). Respondent Rural Telephone Coalition ("RTC") is an alliance composed of three national trade associations, the National Rural Telecom Association ("NRTA"), the National Telephone Cooperative Association ("NTCA") and the Organization for the Promotion and Advancement

of Small Telecommunications Companies ("OPASTCO"), which together represent the interests of more than 850 small and rural incumbent LECs.

In the Court of Appeals, USTA and RTC joined with other parties to challenge the validity of Federal Communications Commission ("FCC" or "Commission") rules governing the price and other central terms of interconnection agreements that must be reviewed and approved by State commissions. USTA and the RTC also separately challenged the validity of two FCC rules of special significance to small and rural carriers: (1) 47 C.F.R. § 51.405, which required State commissions to apply restrictive standards of proof when determining whether small and rural carriers should be relieved of undue burdens imposed by the Act; and (2) 47 C.F.R. § 51.303, which required State commissions to review and approve all interconnection agreements adopted by carriers prior to the effective date of the 1996 Act.

The Eighth Circuit vacated both of these regulations based upon its conclusion that the text of 47 U.S.C. § 251(f) and 47 U.S.C. § 252(a)—which assign States the responsibility for making exemption determinations and reviewing interconnection agreements—also vest States with exclusive jurisdiction to establish the rules governing these State proceedings. The Commission and the other Petitioners have now sought review of these rulings as part of their broad-based challenge to the decision of the Eighth Circuit. *See* FCC Br. at (I) (question 1); AT&T Br. at (i) (question 1); MCI Br. at (i) (question 2); ALTS Br. at (i) (question 2); *see also* FCC Br. at 19, 26 n.9. Petitioners nevertheless fail to provide this Court with any background concerning these regulations or the statutory provisions they implement. That background is presented here.[1]

---

[1] This brief only addresses the Eighth Circuit's decision with respect to the two referenced rules of special concern to small

A. The Statutory Framework

Throughout much of this century, States have adopted specially tailored policies designed to maintain the investment incentives of the small and rural carriers that provide service to remote areas.[2] Providing service to rural areas has presented challenging policy issues for many decades because the high cost associated with the delivery of rural service makes it difficult for telephone companies to offer customers affordable rates or to provide investors with attractive rates of return. Small carriers that have made the substantial investment in rural markets are obligated to serve their entire local exchange service areas as "carriers of last resort." As a consequence, these small businesses are particularly vulnerable to "cream skimming" by new entrants that target only high-volume business users in the rural territories. *See, e.g.*, H.R. Rep. No. 81-246, at 8 (1949) (observing that telephone companies were "running their lines down the highways into the most profitable areas and relegating farmers in the less profitable service areas perpetually to a nontelephone hinterland"). Left unchecked, the loss of even one or two high-volume customers in a rural market will drive up the costs of serving the rural LECs remaining residential

---

LECs. USTA and RTC join the arguments set forth in the briefs of the Regional Bell Companies and GTE (the "Large LECs") and the Mid-Sized Local Exchange Carriers (the "Mid-Sized LECs") with respect to the other rules at issue in this case.

[2] *See, e.g., AT&T Communications of the Mountain States*, 61 Pub. Util. Rep. 4th 102, 113 (Wy. 1984) (noting that universality of basic service has been "accomplished in Wyoming through years of concerted effort by utilities and this commission"); *Northwestern Bell Tel. Co.*, 71 Pub. Util. Rep. 1, 11 (S.D. P.U.C. 1947) (stating that "it has been the general policy of this Commission to encourage the extension of exchange service into every community and household of the state"); *In re Mountain States Tel. & Tel. Co.*, Pub. Util. Rep. 1916B, 169, 171 (Co. P.U.C. 1915) (requiring defendant telephone company to "make every effort to serve all communities within the State").

customers and/or diminish the economic viability of the rural service providers.[3] State commissions, the FCC, Congress, and economists have long recognized that the efficiency and public policy justifications for introducing competition have been far less apparent in rural markets than in densely populated urban areas where vast economies of scale and lower cost service are possible.[4]

1. In enacting the Telecommunications Act of 1996, Congress fundamentally changed the nature of competition in the markets for local telecommunications services by removing many competitive barriers to entry. But Congress did not renounce decades of special policies designed to enable small companies to provide service and update their networks in rural areas, or the significance of the States' role in fostering the success of these rural ventures. Congress's decision to rely upon the States to develop competition policies tailored to the rural markets is reflected throughout the 1996 Act. *See* 47 U.S.C. § 253(a), (f) (adopting general rule that States may not bar the entry of any telecommunications competitor, except that States may limit competitive entry "in a service area served by a rural telephone company" in certain

---

[3] *Cf. Public Service Commission v. Mountain States Tel. & Tel. Co.*, Pub. Util. Rep. 1924C, 545, 560-61 (Mont. P.S.C. 1924) (noting that without following policy of averaging rates over customers of high- and low-cost areas "[i]t is entirely conceivable that . . . a great many of the smaller communities of the state, and possibly all of the rural districts, would be cut off entirely from telephone service by prohibitive rates") (citing *New Castle v. Bell Tel. Co.*, Pub. Util. Rep. 1921B, 378, 380 (Pa. P.U.C. 1921) (same).

[4] *See, e.g.*, John C. Panzar and Steven S. Wildman, "Competition in the Local Exchange: Appropriate Policies to Maintain Universal Service in Rural Areas," at 4-8 (Northwestern Univ. 1993) ("Panzar"), attached to National Comms. Infrastructure (Part 3), Hearings Before the Subcomm. on Telecomms. and Finance of the House Comm. on Energy and Commerce, 103d Cong. (Feb. 8-10, 1994) (testimony of Lawrence C. Ware, Rural Tel. Coalition).

circumstances); 47 U.S.C. § 214(e)(2) (permitting the States to determine whether it would promote the "public interest" to provide universal service funding to more than one telecommunications carrier in a rural market); 47 U.S.C. § 251(f) (authorizing State commissions to terminate exemptions and grant suspensions and modifications of the competition provisions of the Act for small and rural carriers).[5]

Section 251(f) provides the States with two central mechanisms to relieve small and rural telephone companies of undue competitive burdens. Section 251(f)(1) first exempts "rural telephone compan[ies]"[6] from the obligations imposed by Section 251(c) on incumbent carriers to offer competitors interconnection with their facilities and unbundled network elements.[7] States are given express authority to administer this exemption. Section 251(f) directs a carrier seeking interconnection with a rural LEC to "submit . . . its request to the State

---

[5] *See also Implementation of the Telecommunications Act of 1996*, 168 Pub. Util. Rep. 4th 89, 96 n.12 (Pa. P.U.C. 1996) (observing that "the interrelationship of [Sections 253(f), 214(e)(2) and 251(f)] is designed to protect rural telephone companies from 'cream skimming' practices by competing carriers," and that "[b]ecause of their small size and limited number of commercial customers, potential 'cream skimming' practices create greater exposure for rural telephone companies").

[6] The definition of a "rural telephone company" is established in 47 U.S.C. § 153(37).

[7] Congress adopted this exemption provision in order to create a "level playing field, particularly when a company or a carrier to which this subsection applies faces competition from a telecommunications carrier that is a large global or nationwide entity that has financial or technological resources that are significantly greater than the resources of the company or carrier." S. Rep. No. 104-23, at 22 (1995) ("Senate Report"); *see also* H.R. Rep. No. 104-204, pt. 1, at 74 (1995), *reprinted in* 1996 U.S.C.C.A.N. 10, 40 (rural exemption necessary to avoid "significant costs associated with seeking a modification or waiver before the Commission").

commission," and the State commission is authorized to terminate the exemption if it "determin[es]" that the "request [for interconnection] is not unduly economically burdensome," is "technically feasible," and is otherwise "consistent" with certain universal service provisions of Section 254. 47 U.S.C. § 251(f)(1)(A). The Act does not authorize the FCC to conduct *any* proceedings relating to the rural exemption. *See* 47 U.S.C. § 251(f).

Section 251(f)(2) also vests States with authority to grant discretionary relief to any LEC (including a rural telephone company) that has "fewer than 2 percent of the Nation's subscriber lines installed in the aggregate nationwide" (referred to herein as "small companies"). These companies "may petition a State commission" for a suspension or modification of any requirement imposed by Sections 251(b) or (c). 47 U.S.C. § 251(f)(2). Congress accordingly afforded the State commission power to exempt (in whole or in part) small carriers from all of the special competitive obligations imposed on incumbent LECs under the 1996 Act. And this section vests the State commission with authority to grant relief if "[it] determines" that such relief "is consistent with the public interest, convenience, and necessity," and that it is necessary to avoid a "significant adverse economic impact on users of telecommunications services generally," an "undue economic[] burden[]," or a "technically infeasible" request made by a carrier. 47 U.S.C. § 251(f)(2)(A), (B). The FCC is not authorized to conduct suspension and modification proceedings under any circumstance. *See* 47 U.S.C. § 251(f)(2).

2. The 1996 Act also preserved State responsibility for regulating rural carriers' agreements with larger, non-competing LECs. For many years, rural telephone carriers have depended upon "co-carrier" relationships with larger companies to provide efficient service to rural subscribers. *See* Panzar at 34. Such joint arrangements between non-

competing LECs have served to reduce modernization costs and preserve revenues for universal service. For example, Extended Area Service ("EAS") arrangements between rural LECs and their neighboring large LECs enable rural and urban subscribers to call each other without incurring long distance charges. The prices of shared service components for rural LECs under such agreements are generally lower than prices made available to requesting carriers in a competitive marketplace. *See id.* at 41.

Rural carriers entered into hundreds of agreements of this type prior to the effective date of the 1996 Act, and one of the questions at issue in this case is how these agreements are affected by the terms of the Act. As described in the briefs of the large and mid-sized LECs, Sections 251 and 252 of the Act seek to introduce competition through reliance on private party negotiations and State commission review and approval of interconnection agreements. Section 252(a)(1) provides that an incumbent local exchange carrier "may negotiate and enter into a binding agreement with the requesting telecommunications carrier" upon receipt of a "request for interconnection, services, or network elements pursuant to section 251." 47 U.S.C. § 252(a)(1). Section 252(e) in turn provides that "[a]ny interconnection agreement adopted by negotiation or arbitration" under Sections 251 or 252 "shall be submitted for approval to the State commission." 47 U.S.C. § 252(e)(1). The Act does not clearly say whether State commissions must require agreements "negotiate[d] and enter[ed] into" before the effective date of the Act to be submitted to them for review and approval. although it clearly does provide that an agreement which was "negotiated" before the enactment date but executed afterwards must be submitted. 47 U.S.C. § 252(a)(1).

B. The FCC's Implementation of the 1996 Act

There is no dispute that Congress authorized States to adopt implementing regulations to fulfill their obligations to conduct exemption and suspension proceedings under

Section 251(f) and interconnection agreement approval proceedings under Section 252. *See* 47 U.S.C. § 261(b) (stating that "[n]othing in this part shall be construed to prohibit any State commission . . . from prescribing regulations . . . in fulfilling the requirements of this part [including Section 251(f) and Section 252(a)], if such regulations are not inconsistent with the provisions of this part"). The FCC confirmed this reading in its order by acknowledging that "we expect that states will interpret the requirements of section 251(f) through rulemaking and adjudicative proceedings." J.A. at 193. Although the FCC initially acknowledged that "states alone" had authority to make determinations under Section 251(f), J.A. at 11, the FCC nevertheless changed its mind (without explaining why), and decided to prevent States from adopting their own interpretations of central terms of Section 251(f) and Section 252(a) through rulemaking or adjudications. The Commission instead adopted "national rules" and directed States to render exemption and suspension decisions that "conform to our rules." J.A. at 435-36.

The national rule promulgated under Section 251(f) sought to dramatically circumscribe the State commissions' discretion to tailor competitive policies to the special characteristics of their rural markets, and sought to compel State commissions to adhere to an unduly restrictive interpretation of the standards for relief established under Section 251(f). First, Rule 51.405 displaced the three prerequisites for terminating an exemption established under Section 251(f)(1)—technical feasibility, undue economic burden, and consistency with universal service provisions—with a single "embellishe[d]" standard, Pet. App. at 28a, that required termination of any exemption absent proof that the request would impose an "undue economic burden."[8] Second, the FCC determined that an "economic

[8] Although the FCC protested in the Eighth Circuit that it did not really intend to displace the other prerequisites for termination

burden" warranting relief could not include any "economic burden that is typically associated with efficient competitive entry." 47 C.F.R. § 51.405(c), J.A. at 1124. Third, once a bona fide request is made by a requesting carrier, the FCC's rule assigned the burden of proof to the rural telephone company, based on the Commission's unsupported premise that "it is appropriate to place the burden of proof on the party seeking relief from otherwise applicable requirements." J.A. at 196.

The national rule promulgated under Section 252(a) required State commissions to review and approve hundreds of preexisting agreements between non-competing, neighboring LECs, including EAS agreements. The FCC interpreting the language of Sections 252(a) and (e) to require such approval, despite its acknowledgment that such agreements "were negotiated under very different circumstances, and may not provide a reasonable basis for interconnection agreements under the 1996 Act." J.A. at 30.

C. The Decision of the Eighth Circuit

The Eighth Circuit vacated the FCC's pricing regulations because they "exceeded" the FCC's jurisdiction. *Iowa Utils. Bd. v. FCC*, 120 F.3d 753, 794 (8th Cir. 1997); Pet. App. at 10a. That determination was based upon an analysis of the text of the provisions governing the States' authority to regulate pricing in local exchange markets. Pet. App. at 9a-24a. The Eighth Circuit also vacated the FCC's nonprice rules where the text of the 1996 Act demonstrated a congressional intent to give the States exclusive jurisdiction to implement those sections of the Act.

---

of a rural exemption, the terms of its rule expressly provided otherwise. *See* 47 C.F.R. § 51.405(c), J.A. at 1124 ("In order to justify continued exemption . . . an incumbent LEC must offer evidence . . . . [of] undue economic burden . . . .").

1. The Eighth Circuit vacated the FCC's rules governing State rural exemption, suspension and modification proceedings because the "plain meaning of subsection 251 (f)(1) (governing exemptions) and 251(f)(2) (governing suspensions and modifications) indicates that the state commissions have the exclusive authority to make these determinations." Pet. App. at 28a. The court emphasized that "nothing in either of these provisions, or in the Act generally, provides the FCC with the power to prescribe the governing standards for such determinations." *Id.* In contrast to the "repeated and exclusive" references to State commission determinations in Section 251(f), the Court of Appeals found absolutely "no indication that State commissions must follow FCC standards" in conducting exemption, suspension or modification inquiries. *Id.*

The court found that this conclusion was further confirmed by the fact that Congress had rejected both a Senate bill and a House bill giving the FCC concurrent jurisdiction with State commissions to administer these provisions. *Id.* at 29a. The court held that it would be "unreasonable to infer from subsection 251(d) or the other general rulemaking provisions cited by the FCC that Congress intended to put the Commission—the agency it decided to exclude from the exemption process—in a position to dictate the substantive standards governing the exemption process." *Id.* at 29a-30a.

After resolving the issue based on the language of Section 251(f) alone, the Court of Appeals found that Section 2(b) provided an additional ground for its decision.[9] *Id.* at 30a. The court reasoned that "determinations of

---

[9] Section 2(b) of the Act provides that "nothing in this chapter shall be construed to apply or to give the [FCC] jurisdiction with respect to . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service." 47 U.S.C. § 152(b).

whether small or rural LECs should receive exemptions, modifications, or suspensions" of interconnection duties qualify as "practices or regulations" which are made "in connection with intrastate communication service" within the meaning of Section 2(b). *Id.* The court declined to address respondents' substantive challenges to the regulation in light of its jurisdictional holding. *Id.*

2. The Eighth Circuit also vacated the FCC's rule requiring State commissions to review and approve all preexisting interconnection agreements. The Eighth Circuit determined that "[n]othing" in Section 252 "can be read to authorize the FCC to issue regulations regarding which interconnection agreements must be submitted for state approval." Pet. App. at 35a. The court emphasized that Section 252 "establishes the procedures and standards that *state commissions* must follow when approving and arbitrating agreements under the Act." *Id.* (emphasis in original).

Acknowledging the FCC's "grasp for some sort of statutorily-based jurisdiction over these interconnection agreements," *id.* at 36a, the Court of Appeals nevertheless concluded that "section 2(b) forecloses the ability of the Commission to determine which interconnection agreements must be submitted for State commission approval." *Id.* at 35a (citation omitted). The Court of Appeals concluded that this issue must be resolved by State commissions. *Id.*

3. The Eighth Circuit also rejected the FCC's attempt to compel States to conform their decisions to its "national rules" for an additional reason. As the Eighth Circuit explained, the FCC's order "purport[ed] to preempt any State policy that conflicts with an FCC regulation promulgated pursuant to section 251." Pet. App. at 36a. Even if the FCC had some "residual authority to prescribe and enforce regulations to implement the requirements of section 251" beyond "the six areas in [Section 251] where Congress expressly called for the FCC's participation," *id.* at 37a, the court found that the FCC exceeded that au-

thority. The court held that two sections of the Act directly addressing the issue of preemption—Section 251 (d)(3) and Section 261—expressly "constrain[] the FCC's authority" to adopt binding national rules. *Id.* at 37a. The court explained that Section 251(d)(3) provides that the FCC cannot preempt State commission orders establishing interconnection obligations so long as they are "consistent with the requirements of section 251" and do not "substantially prevent the implementation of the requirements of Section 251 and the purposes of Part II." *Id.* The Eighth Circuit found that "[t]his provision does not require all State commission orders to be consistent with all of the FCC's regulations promulgated under section 251," because it is "entirely possible for a State interconnection or access regulation . . . to vary from a specific FCC regulation and yet be consistent with the overarching terms of section 251." *Id.* at 38a. It found further support for that conclusion in Section 261(b), which authorizes States to adopt rules that are "not inconsistent with the provisions of this part" to "fulfill[] the requirements of this part," but which does not provide that such rules must conform to FCC regulations. *Id.* at 39a.

On the basis of these sections of the Act, the court concluded that the FCC could not preempt State authority based solely on the theory that it had concurrent jurisdiction to adopt rules under Sections 251 and 252. The FCC could only adopt rules with preemptive force—the authority it purported to exercise here—based upon legally supportable findings that divergent State rulings would contravene "the requirements of [Section 251]" or would "substantially prevent implementation of the requirements of . . . section [251] and the purposes of [Part II]." 47 U.S.C. § 251(d)(3)(B)-(C); Pet. App. at 37a. The FCC made no such findings in its order, and the court rejected the agency's view that "an inconsistency between a state rule and a Commission regulation under section 251 is

sufficient for the FCC to preempt the state rule" as an "unreasonable interpretation of the Act." Pet. App. at 40a.

SUMMARY OF THE ARGUMENT

The 1996 Act fundamentally changed the telecommunications industry by eliminating many barriers to entry and imposing unprecedented requirements to stimulate competition. Congress nevertheless recognized that it was premature to introduce such sweeping changes into the sparsely populated rural markets served by small telephone companies who, along with their customers, could be unfairly burdened by the entry of virtually unregulated competitors seeking to serve only the more profitable segments of the rural market. Congress addressed this issue by affording small carriers relief from many of the most onerous competitive burdens associated with the new law, and entrusted the responsibility for administering this relief to the agencies in the best position to assess the special issues presented in rural markets—State commissions that have been helping to preserve and promote the mission of small and rural telephone companies for most of this century. The Eighth Circuit properly determined that the rules adopted by the FCC to implement the sections of the Act addressing these small carrier issues represent an impermissible attempt to exercise jurisdiction reserved to the States, and undermine the scheme of cooperative federalism that Congress sought to establish.

I. The FCC originally conceded that Congress expressly delegated authority to the States to "prescrib[e] regulations" to implement Section 251(f), and initially concluded in the NPRM that "the states alone have authority to make [such] determinations." J.A. at 11. The text of Section 251 confirms that the FCC had it right the first time. When Congress wanted the FCC to adopt regulations to govern issues in State commission proceedings, it expressly said so. *See, e.g.*, 47 U.S.C. § 251(f)(1)(B) (when States terminate an exemption, they are required

to enter orders establishing a schedule for compliance "that [are] consistent in time and manners with Commission regulations"). The legislative history further confirms that reading. The bills passed by both the House and Senate gave the FCC a role in conducting proceedings designed to afford relief to small companies. Both versions were rejected in conference, however, and the states were given *sole* authority to conduct exemption, suspension and modification proceedings for all small carriers. *See* 47 U.S.C. § 251(f)(1)-(2).

The FCC similarly lacked statutory authority to adopt a rule requiring States to review and approve (or disapprove) *all* interconnection agreements that predated the passage of the Act—an interpretation that would have required State commissions to review hundreds (and perhaps thousands) of preexisting agreements between small carriers and their neighboring LECs. The language of Section 252, however, establishes that Congress only afforded the FCC authority to oversee the process of approving private agreements in the event a State commission refuses to act. 47 U.S.C. § 252(e)(5). It is therefore manifestly unreasonable to conclude that Congress gave the FCC authority to dictate how State commissions should construe their statutory responsibilities with respect to the review of preexisting agreements that involve "almost exclusively . . . local intrastate telecommunication services." Pet. App. at 35a.

Other provisions of the Act further confirm congressional intent to leave these interpretive issues to the State commissions. Although the FCC claims that "Congress divided responsibility between the FCC and the state commissions along the lines of legislative and adjudicatory *function*," that theory cannot be reconciled with three other sections of the Act that expressly address the allocation of rulemaking authority between the FCC and the States. FCC Br. at 37 (emphasis in original). First, Section 261 of the Act authorizes States to adopt *"regu-*

lations" to fulfill their responsibilities under the Act, and those State regulations do not have to conform to Commission regulations. *Compare* 47 U.S.C. §261(b) (authorizing implementing regulations by States that are not "inconsistent with the provisions of this part") *with* 47 U.S.C. § 261(c) (authorizing "additional" state regulations beyond those adopted to "fulfill" State responsibilities under the Act, but only if they are consistent with "the Commission's regulations"). Second, Section 251 (d)(3) strictly limited the FCC's authority to preempt State regulations or orders concerning the LECs' "interconnection obligations" when "prescribing [its own] regulations." Yet the FCC rules at issue plainly exceed that authority by "prescribing . . . regulations" that would "preclude the enforcement" of State rules and orders that are "consistent with the requirements and . . . purposes" of the Act, and the FCC made no contrary finding. 47 U.S.C. § 251(d)(3). Third, confirmation of the Eighth Circuit's interpretation of the FCC's authority is also found in Section 2(b) of the Communications Act, which forecloses the assertion of FCC jurisdiction over intrastate service issues in the absence of an unambiguous grant of authority. Nothing in the Act can even plausibly be read as an unambiguous grant of authority to the FCC over these intrastate service issues. As the FCC's own order recognizes, Sections 251 and 252 "do not contain an explicit grant of intrastate authority." J.A. at 448.

II. The Eighth Circuit's interpretation does not undermine the policies of the Act. The FCC has offered no evidence—and there is none—that the Eighth Circuit's decision has disrupted the State processes for deciding the small carrier issues (or any other issues for that matter). The federal scheme is working better without the FCC's mandatory directives to State commissions on these small company issues because it has allowed States needed flexibility—that the FCC's rules denied—to interpret the Act

in light of the State commissions' knowledge and expertise regarding the status of local competition in their states.

The FCC places substantial reliance on its claim that the Eighth Circuit's interpretation of the FCC's jurisdiction frustrates congressional intent by preventing "a single court of appeals" from "resolv[ing]" the "most fundamental issues arising" under the 1996 Act. FCC Br. at 40. But there is no reason to conclude that Congress shared the Commission's view that this was a paramount goal of the Act. To the contrary, the terms of the Act make clear that Congress was content to allow these statutory issues to be resolved through State proceedings conducted over time. Nothing in the statute required the FCC to adopt any interpretations of Sections 251(f) or 252(a), and Congress did not even grant federal district courts jurisdiction to conduct direct review of State commission determinations issued under Section 251(f). This Court should accordingly conclude, as the Eighth Circuit did, that Congress adopted a program that permits States to develop reasonable interpretations of the Act in the course of conducting the proceedings Congress assigned to them. It did not authorize the FCC to short circuit that important State role in the new regulatory scheme.

ARGUMENT

The FCC's attempt to command the States to render decisions that "conform to [its] rules" was properly rejected by the Eighth Circuit. J.A. at 435-36. Contrary to the FCC's claims, there is a very "coherent textual basis for attributing to the Commission jurisdiction to implement some, but not all, of the core federal standards of the local competition provisions." FCC Br. at 15. The language of the Act firmly supports the Court of Appeals' conclusion that the FCC had no authority to displace (or severely circumscribe) the States' responsibility to implement the relief afforded to small carriers under Section 251(f), or to compel State commissions to review thousands of pre-

existing carrier agreements under Section 252(a), with no discretion to evaluate whether they warrant submission. Nothing about this reading of the Act "raise[s] immense obstacles to effective implementation" of congressional policies. FCC Br. at 39. To the contrary, it promotes them.

I. THE LANGUAGE AND STRUCTURE OF THE 1996 TELECOMMUNICATIONS ACT ESTABLISH THAT THE FCC IMPERMISSIBLY DISPLACED THE STATES' AUTHORITY TO IMPLEMENT THE STATUTORY PROVISIONS AT ISSUE

The FCC looks far and wide to support its claim that "Congress directed [it] to create a national framework for individual state commissions to apply" when conducting proceedings under Section 251(f) and Section 252. FCC Br. at 15; *id.* at 30 (stating that Section 271—which has nothing whatsoever to do with the rural exemption provision—"is powerful evidence that Congress meant to authorize the Commission to create a national regulatory framework that the state commissions would apply in adjudicating particular carrier-to-carrier disputes under Sections 251 and 252"). Several provisions of the Act explicitly address the respective roles of the FCC and the State commissions in the implementation of Section 251(f) and Section 252. It is those express provisions which plainly establish that Congress withheld authority from the FCC to tell State commissions how to conduct and decide the matters Congress entrusted to them.

A. The Text Of Sections 251(f) And 252 Plainly Establishes That The FCC Has Exceeded Its Authority

1. The FCC contends that Congress required it to adopt rules implementing "core federal standards" for the 1996 Act's local competition provisions, including the "criteria by which rural carriers may claim exemption from"

interconnection requirements under Section 251(f). FCC Br. at 18-19. In fact, few provisions in the 1996 Act more clearly illustrate Congress's plan to grant *the States* primary authority to implement important sections of the 1996 Act governing competition in intrastate markets. The Court of Appeals correctly concluded that the "plain meaning" of subsections 251(f)(1) and (2) "indicates that the state commissions have the exclusive authority to make [rural exemption] determinations." Pet. App. at 28a.

The FCC contends that it is unreasonable to infer that Congress "divest[ed] [the] Commission of any role in implementing [the] 'rural exemption' provision of Section 251(f)" based on the fact that Congress "assigned the state commissions *some* role in implementing" the Act. FCC Br. at 26 n.9 (emphasis in original). A review of Section 251(f), however, hardly supports the view that Congress just gave State commissions "some" role in implementing Section 251(f)—States were given the *sole* role. As the Eighth Circuit found, subsection 251(f)(1)(B) "explictly provides [that], '*The State commission* shall conduct an inquiry for the purpose of determining whether to terminate the exemption under subsection paragraph (A).'" Pet. App. at 28a (emphasis added). The court emphasized that there are "[r]epeated and exclusive references to such state commission determinations . . . contained throughout subsection 251(f)," while "[i]n contrast, there is no indication that state commissions must follow FCC standards in conducting these inquiries." *Id.*

As the Eighth Circuit further found, Congress "is capable of clearly expressing its desire to grant the FCC authority . . . when it wishes to do so," and it did so in a number of instances. Pet. App. at 14a.[10] Yet Congress

---

[10] Under the statute, the FCC is specifically authorized to issue regulations under subsections 251(b)(2) (number portability), 251(c)(4)(B) (limitations on resale), 251(d)(2) (unbundled network elements), 251(e) (numbering administration), 251(g) (con-

did not direct State commissions conducting exemption, suspension, and modification proceedings to make those determinations in conformity with Commission regulations. Instead, Congress indicated that States were only required to enter orders establishing "an implementation schedule" for compliance "that is consistent in time and manner with Commission regulations" once they have concluded that the termination of an exemption is warranted. 47 U.S.C. § 251(f)(1)(B); *see* Pet. App. at 29a. The fact that Congress only directed State commissions to adhere to specified Commission regulations "[u]pon termination of [an] exemption" negates any inference that Congress impliedly authorized the FCC to adopt other rules governing a State commission's resolution of requests pertaining to exemptions under Section 251(f). 47 U.S.C. § 251 (f)(1)(B).[11]

The FCC's claim that Congress intended rural exemption determinations to be governed by federal regulations is further undermined by the fact that Congress expressly rejected versions of Section 251(f) which gave the FCC concurrent jurisdiction with State commissions to administer the exemption and waiver provisions for small local

---

tinued enforcement of exchange access), and 251(h)(2) (treatment of comparable carriers as incumbents). Pet. App. at 12a n.10, 29a n.23.

[11] Indeed, the interpretation of the 1996 Act that the FCC has advocated would render this language of Section 251(f)(1)(B) superfluous. Under the Commission's reading of the Act, all of the State commission's determinations under Section 251(f) must "comply with the Commission's regulations." J.A. at 455. But if the FCC already possesses broad authority to adopt regulations implementing Section 251(f) as it alleges—regulations which the States would be obligated to apply in resolving requests for relief under that section—it would have been completely unnecessary for Congress to direct the States to adopt an implementation schedule that conformed to Commission regulations. It is apparent, therefore, that Congress simply did not authorize the Commission to adopt any other regulations implementing Section 251(f).

exchange carriers. The Senate bill provided that the Commission *or* a State could provide small companies with relief from the obligations of Section 251. *See* S. 652, 104th Cong. § 251(i) (1995); Senate Report at 22. The House bill gave State commissions authority to administer exemption and waiver provisions for rural telephone companies, but also gave the FCC authority to grant waivers for any local exchange carrier with fewer than 500,000 access lines installed. *See* H.R. 1555, 104th Cong. § 242 (e)-(g) (1995). Both of these bills were rejected in conference, and the States were given *exclusive* authority to conduct exemption, suspension and modification proceedings for all small carriers. *See* 47 U.S.C. § 251(f)(1)-(2). The FCC's effort to claim dual jurisdiction to control the resolution of exemption proceedings in State commissions after Congress deliberately excluded the FCC from the process was correctly rejected by the Court of Appeals. *See* Pet. App. at 29a; *Russello v. United States*, 464 U.S. 16, 23 (1983) (declining to adopt an interpretation at odds with changes in the language of a bill).

The language and history of Section 251(f) makes its intent plain. Congress determined that State agencies are better situated to evaluate the special concerns of rural areas, and to administer provisions designed to shield small companies operating in their jurisdictions from unduly harmful effects of the new obligations. Under these circumstances, it is unreasonable to infer that Congress nevertheless meant to put the FCC—the agency it decided to exclude from the exemption process—in a position to dictate the substantive standards that States should apply in their own agency proceedings (let alone to rewrite the statutory standard).

2. Subsections 252(a) and (e) of the Act require interconnection agreements to be approved by State commissions. In its pursuit of increased competition at any cost, the FCC determined that States must review and

approve (or disapprove) all interconnection agreements that predated the passage of the Act. The FCC reached this conclusion even though the State of Wisconsin, for example, had interpreted Section 252(a) to exclude agreements executed before the effective date, and explained the unwarranted burdens the FCC's interpretation would impose on State commissions. Petition for Reconsideration by Public Service Commission of Wisconsin, *In re Implementation of the Local Competition Provisions of the Telecommunications Act of 1996*, CC Docket No. 96-98 (Sept. 30, 1996). Under this interpretation, hundreds upon hundreds of contracts negotiated under "very different" competitive circumstances, J.A. at 30, must be reviewed by State commissions. The Eighth Circuit correctly vacated the rule based upon its finding that State commissions—not the FCC—were given authority to interpret the scope of their own obligations under this section.

As set forth in the Eighth Circuit's opinion, the FCC's jurisdiction to adopt regulations implementing the 1996 Act is limited in scope. Section 252 of the 1996 Act establishes the process and standards that *States* must follow when arbitrating and approving interconnection agreements. The FCC's role under this section is extremely circumscribed—indeed, it is limited only to stepping in to oversee the arbitration process in the event that a State commission refuses to act. *See* 47 U.S.C. § 252(e)(5). The text and structure of Section 252 cannot reasonably be read to confer upon the FCC the authority to implement regulations specifying the obligations of interconnectors to submit their agreements for approval under subsections 252(a) and (e). As the court found, these agreements "almost exclusively involve local intrastate telecommunication services," Pet. App. at 35a, where Congress has traditionally relied upon State commissions to regulate competition. The fact that Congress has established limited standards to guide the exercise of the States' discretion does not mean that the FCC is the final arbiter of

how the States should implement those standards. The Eighth Circuit correctly determined that Congress assigned that role to the States.

B. The Eighth Circuit's Rejection Of The FCC's Authority To Adopt Mandatory Rules Implementing Sections 251(f) And 252 Is Firmly Grounded In Other Provisions Of The Act

In an effort to find some justification for its blanket preemption of the States' authority to interpret the sections of the Act they alone must administer, the FCC claims that "Congress divided responsibility between the FCC and the state commissions along lines of legislative and adjudicatory *function*." FCC Br. at 37 (emphasis in original). According to the Commission, Congress wanted it to make the rules, and wanted the State commissions to apply them. That division of responsibility is not, of course, reflected in the language of Section 251(f) or Section 252(a), and it is contradicted by three other sections of the Act that expressly address the allocation of authority between the FCC and the States.

1. The FCC does not even attempt to reconcile its theory concerning Congress's division of responsibility with Section 261 of the Act. That section plainly establishes that Congress did not relegate State commissions to an adjudicatory role. Instead, it authorized States to adopt "regulations" to fulfill their responsibilities under the Act, including Sections 251(f) and 252(a), and provided that the States' implementing regulations need not conform to Commission regulations. Section 261(b) is explicit: "[*n*]*othing in this part* shall be construed to prohibit any State commission . . . from prescribing regulations . . . in fulfilling the requirements of this part [including Section 251(f) and Section 252(a)], if such regulations are not inconsistent with the provisions of this part." 47 U.S.C. § 261(b) (emphasis added). Nor can the FCC reasonably contend that State commission regulations are "incon-

sistent with the provisions of this part" whenever they are inconsistent with regulations adopted by the Commission. Any such construction is foreclosed by the language of the very next subsection, Section 261(c). That section expressly requires States to conform their rules to "the Commission's regulations" if they seek to adopt "additional" regulations beyond those enacted under Section 261(b) to "fulfill[] the requirements of this part." 47 U.S.C. § 261 (b), (c). If Congress truly had intended to conform State implementation of the Telecommunications Act of 1996 to FCC regulations, it would have said so explicitly, as it did in Section 261(c). Instead, Congress clearly granted the States the autonomy to implement the Act in the first instance, and not merely to "apply" a preordained, FCC-defined "framework" as the agency suggests. FCC Br. at 9.

Although the Commission unsuccessfully attempted to distinguish the application of Section 261 before the Eighth Circuit, *see* Pet. App. at 39a, the Commission *does not even mention* the provision here. Nevertheless, Section 261(b) contains an explicit recognition that the States have authority to "prescrib[e] regulations" to "fulfill[] the requirements of this part."[12] The FCC's attempt to impose binding regulations that States must follow in exemption, suspension and modification proceedings, or with respect to Section 252(a) carrier agreement filings, accordingly cannot be reconciled with the Act.

2. Section 251(d)(3) further confirms that State commissions are not obligated to implement Section 251(f) and Section 252(a) in accordance with national regulations adopted by the FCC. Under that section, Congress prohibited the FCC from "prescribing . . . regulations" that would "preclude the enforcement" of any State "regu-

[12] The FCC itself recognized in its order that "we expect that states will interpret the requirements of section 251(f) through rulemaking and adjudicative proceedings." J.A. at 193.

lation, order or policy" establishing "access and interconnection obligations of local exchange carriers" which is "consistent with the requirements and . . . purposes" of the Act. 47 U.S.C. § 251(d)(3). Yet that is exactly what the Commission has sought to do by establishing a uniform national rule governing any "order" issued by the State in Section 251(f) and Section 252 proceedings which "establish[] the . . . obligations of local exchange carriers." *Id.*

The Eighth Circuit correctly observed that Section 251(d)(3)'s requirement of "consisten[cy] with the requirements of section 251" does not necessarily mean "consisten[cy] with all of the FCC's regulations promulgated under section 251." Pet. App. at 37a. The Court of Appeals recognized that, given the specific way the text of the provision is drafted, "[i]t is entirely possible for a state interconnection or access regulation, order or policy to vary from a specific FCC regulation and yet be consistent with the overarching terms of section 251." *Id.* at 38a. The FCC responds in conclusory fashion, claiming that it is "illogical to presume that Congress withheld" a binding "interpretive role"—apparently with respect to every issue that arises in Section 251(f) and Section 252 proceedings —"from the agency to which it gave preemptive authority." FCC Br. at 23 n.7.

That reading makes no sense. Congress clearly knows how to draft a preemption provision. And if Congress had intended to permit the FCC to preempt categorically any "regulation, order, or policy of a State commission" establishing "access and interconnection obligations," it would have simply said so. Instead, Congress dramatically circumscribed whatever rulemaking authority the FCC has by *prohibiting* the FCC from "preclud[ing] the enforcement of any [State commission] regulation, order, or policy" when "prescribing [its own] . . . regulations to implement the requirements of this section," except in

limited circumstances.[13] 47 U.S.C. § 251(d). As the Court of Appeals found, Section 251(d)(3) emphatically "does *not* support the FCC's view" that "state rules must conform to the Commission's regulations." Pet. App. at 39a (emphasis added).

3. Confirmation of the Eighth Circuit's interpretation of the FCC's authority is also found in Section 2(b) of the Communications Act.[14] As the Court of Appeals explained, "determinations of whether small or rural LECs should receive exemptions, modifications, or suspensions of such duties also qualify as practices or regulations 'for or in connection with intrastate telecommunications service' that are outside of the FCC's jurisdiction by the operation of section 2(b)." Pet. App. at 30a (quoting 47 U.S.C. § 152(b)). And the court was also correct in concluding that Section 2(b) "forecloses the ability of the Commission to determine which interconnection agreements" governing intrastate service "must be submitted for state commission approval." *Id.* at 35a. The flaws in the FCC's analytical efforts to avoid the straightforward operation of Section 2(b) are set forth fully in the briefs of the large and midsized LECs. Their arguments apply equally to the small and rural company issues addressed here, and Respondents USTA and RTC accordingly join those briefs. Here we emphasize two points.

---

[13] The limited scope of the FCC's preemptive authority is also confirmed by 47 U.S.C. § 253(d). Even under that section, which explicitly provides for FCC preemption of state regulations that function as barriers to entry, the FCC cannot preempt a state regulation erecting barriers to entry in violation of Section 253(a) or (b) without first providing notice and the opportunity for comment.

[14] That provision of the Act provides that "nothing in this chapter shall be construed to apply or to give the [FCC] jurisdiction with respect to . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service." 47 U.S.C. § 152(b).

First, the Commission's contention that Section 2(b) is inapplicable because the Congress has "straightforward-[ly]" subjected competition in local telecommunications markets to federal regulation, FCC Br. at 33-34 (citing *Louisiana Public Serv. Comm'n v. FCC*, 476 U.S. 355, 377 (1986)), is without merit. Nothing in the Act can even plausibly be read as an unambiguous grant of authority to the FCC over intrastate service issues, as the *FCC itself has recognized. See* J.A. at 448 (acknowledging that Sections 251-252 "do not contain an explicit grant of intrastate authority"); J.A. at 7-8 (observing that States historically have regulated competition in local service areas). Instead, Congress has "straightforward[ly]" preserved State authority by giving State commissions—not the FCC—responsibility for implementing small company policies established by the Act.

Second, the FCC's suggestion that the consideration of the conditions that rural carriers face in particular local markets, or the policy merits of filing hundreds of thousands of EAS and other locally-oriented carrier-to-carrier agreements, is "inextricably" both interstate and intrastate in character, FCC Br. at 35, is simply wrong. The exemption, suspension and modification proceedings under Section 251(f), for example, determine the extent to which competitive obligations should be imposed on small and rural carriers to provide "telephone exchange service in [a local] area." *See* 47 U.S.C. § 251(h)(1). The FCC has conceded that "telephone exchange service" is a "local, intrastate service." J.A. at 449. There accordingly can be no question that the rule at issue represented the assertion of FCC "jurisdiction with respect to . . . classifications, practices, . . . or regulations for or in connection with intrastate communication service," within the meaning of Section 2(b). 47 U.S.C. § 152(b); *see Louisiana*, 476 U.S. at 370 (noting that "this provision fences off

from FCC reach or regulation intrastate matters—indeed, including matters 'in connection with' intrastate service").

C. The FCC's Rules Cannot Be Upheld On The Basis Of *Chevron*

The FCC's appeal to *Chevron* deference, *see* FCC Br. at 42 (citing *Chevron U.S.A., Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837 (1984)); *see also* FCC Br. at 17, is unavailing. As a threshold matter, *Chevron* has no role to play when the agency's interpretation does not reflect a reasonable reading of congressional intent, *see Lechmere, Inc. v. NLRB*, 502 U.S. 527, 539 (1992), and the FCC's reading of its authority to interpret Sections 251(f) and 252(a) assuredly was not.

In addition, the application of *Chevron* makes little sense where, as here, the FCC shares responsibility for administration of the statute with other governmental bodies. *See Bowen v. American Hospital Ass'n*, 476 U.S. 610, 642 n.30 (1986) (where administration of a statute is shared among agencies, there "is not the same basis for deference predicated on expertise" as in other contexts); *Rapaport v. United States Dep't of Treasury, Office of the Thrift Supervision*, 59 F.3d 212, 216 (D.C. Cir. 1995) (no *Chevron* deference where Congress delegated statutory responsibility to at least three other agencies), *cert. denied*, 516 U.S. 1073 (1996). The deference afforded under *Chevron* is based upon the premise that Congress would have wanted courts to defer to reasonable interpretations advanced by the agency given responsibility for implementing the statute. *See Adams Fruit Co. v. Barrett*, 494 U.S. 638, 649 (1990) (observing that a "precondition" to *Chevron* deference is a congressional delegation of administrative authority); *cf. Crandon v. United States*, 494 U.S. 152, 177 (1990) (Scalia, J. concurring) (rejecting *Chevron* deference where statute "is not administered by any agency but by the courts"). *Chevron* deference is accorded to agencies "because of a presumption that Congress, when it left

ambiguity in a statute meant for implementation by an agency, understood that the ambiguity would be resolved, first and foremost, by the agency." *Smiley v. Citibank (South Dakota), N.D.*, 517 U.S. 735, 740-41 (1996). But Section 261(b) clearly establishes that the *States* have such implementing and interpretive authority under Section 251(f) and 252(a), and Congress unquestionably circumscribed the FCC's authority to displace that power.

Under these circumstances, where the States in fact possess the "historical familiarity and policymaking expertise" with respect to local rural service issues and intrastate carrier-carrier agreements, *Martin v. OSHRC*, 499 U.S. 144, 153 (1991), it would be at least as reasonable—in fact more reasonable—to afford deference to the *States'* interpretations of these provisions.[15] There certainly is no language of delegation anywhere in the 1996 Act that supports the notion that the FCC's views should trump those of the States, or of the courts, on this question. Given the breadth and intrusiveness of the FCC's proposed rules, deference to the Commission is not appropriate. *Cf. Gregory v. Ashcroft*, 501 U.S. 452, 464 (1991) (before interpreting statute to accord "state-displacing weight" to federal law, it "must be absolutely certain that Congress intended such an exercise"); *United States v. Bass*, 404 U.S. 336, 349 (1971) (requiring "clear statement" by Congress in "traditionally sensitive areas, such as legislation affecting the federal balance"); *Amos v. Maryland Dep't of Public Safety & Correctional Servs.*, 126 F.3d 606-07 (4th Cir. 1997) (declining to defer to federal administrative agency's interpretations of ambiguous federal statute, "however reasonable," where there are "enormous" implications for the "balance of power between Federal Government and the States").

---

[15] Indeed, as the Large LECs explain, the very presumption written into the text of the Communications Act on these intrastate matters is that they are completely "fence[d] off" from the FCC's reach. *Louisiana*, 476 U.S. at 370; 47 U.S.C. § 152(b).

II. THE EIGHTH CIRCUIT'S INTERPRETATION DOES NOT UNDERMINE THE POLICIES OF THE ACT

The FCC attempts to bolster the weaknesses in its textual arguments with broad assertions that competition in "local telephone markets" is being "impede[d]," FCC Br. at 39, because the FCC has not been granted *carte blanche* to dismantle the framework of cooperative federalism that Congress intended with respect to the implementation of Sections 251-252. Contrary to the FCC's claims, Congress *did* "leave room"—indeed, plainly intended—to give 50 State commissions latitude to define the precise contours of determinations related to rural telephone company exemptions, suspensions, and modifications, and the filing of co-carrier agreements, in the context of competition issues and conditions now arising in their local market. There is no practical reason to revisit the wisdom of Congress's choice.

1. Contrary to the FCC's assertions, the Section 251-252 framework of private party negotiation and State commission arbitration crafted by Congress has been working well since the Act's passage to foster the emergence of local exchange competition. To date, *thousands* of local interconnection agreements have been signed since the Act's passage, with new competitors emerging each day in local telephone markets. *See* Roy Neel, President, United States Telephone Association, *En Banc Presentation on State of Local Competition before the FCC* (Jan. 29, 1998) (observing that by November 1997, incumbent LECs had signed more than 2,400 voluntary agreements with 280 local service competitors). That process would be even more effective if the FCC had not decided, in the most intrusive manner possible, to inject itself into the private party negotiation and State commission arbitration processes. Congress intended private parties first, and then the States, to be the impetus for the development of local

competition. Congress did *not* invite the FCC to introduce more than 700 pages of binding federal guidance into Congress's "pro-competitive, de-regulatory" program.

2. The FCC also has offered no evidence that the Eighth Circuit's decision has disrupted the State processes for deciding the small carrier issues discussed herein. As a practical and policy matter, Congress's deference to the States with respect to local interconnection matters generally, and with respect to rural exemption and interconnection agreement filing issues in particular, makes perfect sense. The State commissions are the agencies with the specific knowledge and expertise regarding the status of local competition in their States, and the particular carriers that are either incumbent, emerging and/or at risk when local competition is introduced.

Two examples illustrate the fact that Congress's scheme is working better without the FCC's mandatory directives to State commissions on these small company issues. The Alabama Public Service Commission recently considered the "financial and technical limitations of [Alabama's] small LECs"; found that the interconnection obligations imposed by subsections 251(b) and (c) would impose undue economic burdens; and temporarily suspended those obligations pending further review of "the effects of competitive entry" on Alabama's rural carriers. *In re All Telephone Cos. Operating in Alabama*, No. 24472 (LEXIS, Pub. Util. Rep. 4th, slip op.) (Oct. 8, 1996). Significantly, that determination was based upon a reasonable interpretation of the Act *without* reference to the FCC's "embellishe[d]" and restrictive standard of proof for rural exemption, suspension and modification proceedings, Pet. App. at 28a, which otherwise could have undermined Alabama's ability to shape competition policy in accordance with the needs of its small carriers and their customers.[16]

---

[16] Congress established that State commissions could not terminate an exemption or deny a suspension or modification, when the

Similarly, some State commissions have been assessing what types of agreements should be filed under Section 252(a) pursuant to their own reasonable interpretations of the Act. Minnesota, for example, has commenced a proceeding to determine whether EAS agreements, which are of enormous importance to small and rural carriers, in fact represent the type of agreements that should be subject to Section 252(a) filing and approval requirements. *See In re U.S. West Communications, Inc.*, No. P-421, 1997 WL 634623 (Minn. P.U.C. June 24, 1997). Under the FCC's mandatory rules, that inquiry would have been foreclosed because the FCC determined that all preexisting agreements, including EAS agreements, had to be filed with State commissions. *See* J.A. at 1111 (text of 47 C.F.R. § 51.303).

The actions unfolding in the States illustrate the problem with the FCC's emphasis on the alleged practical and policy need for "nationally consistent interpretations" regarding local competition issues. FCC Br. at 40. Con-

---

imposition of certain obligations under Section 251 would be "unduly economically burdensome." *See* 47 U.S.C. § 251(f)(1)(A) and (2)(A)(ii). This was the standard that Alabama applied. Section 51.405(c) and (d) of the FCC's new rules, however, would have required proof of an "undue economic burden" other than an "*economic burden that is typically associated with efficient competitive entry*." 47 C.F.R. § 51.405(c), (d) (emphasis added). Under this new "efficient competitive entry" standard—which appears *nowhere* in the statutory text—State commissions such as Alabama would have been required to disregard losses that would threaten the viability of a rural telephone company if such losses would be attributable to the entry of a more efficient competitor seeking to serve part of a rural market. The FCC's interpretation completely ignores the fact that Congress understood the need to give States substantial latitude to mitigate the impact of the Act on rural telephone companies and their customers. *See, e.g.*, 47 U.S.C. §§ 253(f), 214(e); *see also* 47 U.S.C. § 613(d)(3), (e) (defining an "undue burden" in another section of the Communications Act to include any "significant difficulty or expense"); *Air Line Pilots Ass'n Int'l v. Civil Aeronautics Bd.*, 494 F.2d 1118, 1125 (D.C. Cir. 1974) (interpreting similar phrase in statute creating small carrier exemption from economic regulatory provisions of the Federal Aviation Act to reflect intent to keep small carriers "economically viable").

gress's point in crafting the Section 251-252 regime in fact was (and is) just the opposite: except for certain discrete matters where federal involvement is required by the Act, local competition determinations should be market-specific, not "nationally uniform." [17]

3. The FCC places substantial reliance on the claim that the Eighth Circuit's interpretation of the FCC's jurisdiction frustrates congressional intent by preventing "a single court of appeals" from "resolv[ing]" the "most fundamental issues arising" under the 1996 Act "soon after the Act's enactment." FCC Br. at 40. But there is no reason to conclude that Congress shared the Commission's view that this rulemaking proceeding should culminate in uniform national rules—*even* if Congress had given the Commission concurrent juisdiction to address these issues.

There is no dispute that Congress expected States to adopt interpretive rules when conducting rural exemption and interconnection proceedings, and that Congress did not *require* the FCC to adopt rules on the statutory questions at issue here. Congress was accordingly content to allow these issues to be resolved through State proceedings conducted over time. In addition, as the Eighth Circuit held, Congress did not allow the FCC to establish nationally uniform standards which categorically preempt contrary State rules. The Eighth Circuit rejected the FCC's view that its rules can "preempt any [different] state policy" as "untenable." Pet. App. at 36a. As discussed *supra* at I.B., the FCC's assertion that State decisions implementing Section 251 and 252 must conform to FCC regulations, even where Congress did not say so, is refuted by Sections 261(b) and 251(d)(3). Nor did Congress create a scheme where federal district courts would

---

[17] This does not mean, of course, that States cannot follow the FCC's implementation approaches on rural exemption or LEC-LEC agreement filing issues, provided that such approaches are consistent with the Act. Indeed, various States have done so. But Congress clearly intended the States to implement the Act in accordance with their individual assessment of local market conditions, irrespective of whether the FCC might take a divergent position.

"supply nationally consistent interpretations" for all of the provisions construed by the FCC in its rules, as the FCC contends. FCC Br. at 40. Congress did *not* grant federal courts jurisdiction to conduct direct review of State commission determinations issued under Section 251(f) (except insofar as such issues might arise in connection with review of State commission arbitration orders). *Compare* 47 U.S.C. § 252(e)(6) *with* 47 U.S.C. § 251(f).

There is accordingly no reason to presume that Congress thought that all central issues of statutory interpretation arising under Sections 251 and 252 should be adjudicated in a single federal court proceeding. Instead, this Court should find that Congress adopted a program that permits States to develop reasonable interpretations of the Act in the course of conducting the proceedings Congress assigned to them. Short-circuiting that process in the name of litigation expediency undermines the State's role in the statutory scheme without any justification in the text of the statute.

CONCLUSION

For the reasons set forth, respondents respectfully request this Court to affirm the decision of the Court of Appeals.

Respectfully submitted,

QUESTIONS PRESENTED

1. Did the court of appeals correctly decide that the Federal Communications Commission ("FCC") exceeded its statutory authority under the Communications Act of 1934, as amended by the Telecommunications Act of 1996 ("1996 Act"), when issuing orders and rules purporting to implement the provisions in the 1996 Act governing competition in local telephone markets?

2. Did the court of appeals correctly decide to vacate an FCC rule that, as petitioners themselves acknowledge, would allow new entrants to obtain from incumbent local telephone carriers an already combined platform of network elements at cost-based prices, when the Act allows entrants to obtain only *unbundled* network elements at cost-based prices?

3. Did the court of appeals correctly decide to vacate the FCC's rule implementing 47 U.S.C. § 252(i) as improperly subverting the system of private negotiation established by Congress?

4. Did the court of appeals err in upholding the following: (a) the FCC's ruling that entrants into the local telephone markets—without using any of their own facilities—may rely solely on the purchase of network elements, at cost-based prices, to provide local service; and (b) the FCC's expansion of the statutory definition of network elements to include Operations Support Systems, directory assistance, operator services, and vertical services?

INTRODUCTION

This brief is filed on behalf of eight telecommunications companies that are based in virtually every part of the country, and on behalf of a trade association of telecommunications companies. Each of the companies is an incumbent local exchange carrier ("LEC"), as that term is defined in 47 U.S.C. §§ 153(26) and 251(h)(1), as added by the Telecommunications Act of 1996, Pub. L. No. 104-104, 110 Stat. 56 (1996) ("1996 Act" or "Act").[1] The eight companies actively participated as petitioners and intervenors in the briefing and argument before the United States Court of Appeals for the Eighth Circuit and were collectively referred to as the "Mid-Sized LECs."[2] In contrast to the "large LECs," *i.e.*, the Bell Operating Companies ("BOCs") and GTE Service Corporation ("GTE"), each of the Mid-Sized LECs individually controls less than two percent of the nation's telephone access lines. The Independent Telephone & Telecommunications Alliance is a non-profit trade association representing 15 mid-sized LECs providing local exchange and exchange access telephone service in 41 states.

---

[1] The relevant portions of the 1996 Act amended the Communications Act of 1934, 47 U.S.C. § 151 *et seq.* ("Communications Act"). Relevant statutes are in the appendix to the BOC's merits brief. *See also* appendix to the petition in No. 97-826 ("Pet. App."). The Mid-Sized LECs' Rule 29.6 statement is in their opposition to the petition.

[2] The "Mid-Sized LECs," and their principal places of business, are as follows: Aliant Communications Co. (Lincoln, Nebraska); ALLTEL Telephone Services Corp. (Little Rock, Arkansas); Cincinnati Bell Telephone Co. (Cincinnati, Ohio); The Concord Telephone Co. (Concord, North Carolina); North State Telephone Co. (High Point, North Carolina); Rock Hill Telephone Co. (Rock Hill, South Carolina); Roseville Telephone Co. (Roseville, California); and The Southern New England Telephone Co. ("SNET") (New Haven, Connecticut). The Mid-Sized LECs filed briefs and presented oral argument in the Eighth Circuit's review of the FCC's First Report and Order in *Iowa Utilities Bd. v. FCC*, No. 96-3321, but did not participate in the court's separate review of the FCC's Second Report and Order in *California v. FCC*, No. 96-3519. Accordingly, the Mid-Sized LECs do not address the decision in *California*.

The Mid-Sized LECs have endeavored in this brief not to repeat the arguments set forth in the merits briefs filed today by the BOCs, GTE, and the United States Telephone Association/Rural Telephone Coalition. The Mid-Sized LECs fully support those parties' arguments and incorporate them by reference in this brief. Nonetheless, as some of the approximately one thousand smaller local telephone companies throughout the United States, the Mid-Sized LECs have a unique perspective on the issues raised in this case. In their Statement, the Mid-Sized LECs describe the background, language, and structure of the 1996 Act, which underscores the central role that Congress envisioned state utility commissions would play in implementing the Act's broad goals. The Statement further discusses the progress that state regulators have made in opening local telephone markets to competition in the manner prescribed by Congress. Finally, the Mid-Sized LECs focus their Argument on the Eighth Circuit's decision regarding provisions of the Act that have been virtually ignored by petitioners, and that further demonstrate that Congress did not intend the FCC to issue detailed, uniform, national rules that bind state commissions and stifle state regulators' ability to implement the 1996 Act in the manner Congress intended.

STATEMENT

In enacting the Telecommunications Act of 1996, Congress followed the lead of numerous states that had already taken steps to open their local telephone markets to competition. Congress did so by preempting any remaining state laws that prohibited competition with incumbent local exchange carriers and by requiring incumbent LECs to, among other things, permit new entrants to interconnect with their networks and gain unbundled access to discrete elements of those networks. In passing the Act, however, the 104th Congress expressly sought to promote local competition through a deregulatory and decentralized approach. That approach relied first upon voluntary negotiations between potential competitors and, second, upon state commission-run arbitrations of issues that the parties

were unable to resolve among themselves. Congress thus sought to take advantage of the knowledge and experience of state regulators, who had long regulated local exchange service—what the Government in the past has described as the "paradigmatic intrastate market"[3]—and who best understood the regulatory history, needs and conditions of the diverse local markets and the over 1,000 incumbent LECs providing local exchange service throughout the United States. While Congress granted the FCC statutory authority to regulate with respect to certain provisions of the Act, Congress expressly preserved the authority of state utility commissions to implement the broad goals of the Act through their own regulations, applied in state commission-run arbitrations when private negotiations failed. Moreover, Congress carefully limited the power of the FCC to preempt those state regulations. In this way, Congress recognized and preserved the historical authority of state commissions as the primary regulators of local telephone markets, permitting the FCC to step in and regulate only when the states failed to execute their responsibilities under the Act.

As described below, the FCC chose to ignore Congress's deregulatory and decentralized scheme. The FCC placed itself in complete control of every local telecommunications market throughout the country by issuing uniform national rules that inhibited negotiations and preempted any and all state regulatory policies that differed in any way from those rules. The Eighth Circuit properly concluded that in doing so, the FCC had far exceeded its statutory authority under the Act.

A. Regulation of Local Telephony Before the Telecommunications Act of 1996

1. State regulation of local telephone service. Since the invention of the telephone in 1876, most local tele-

---

[3] In the unsuccessful Application to Vacate Stay it filed in this Court, the FCC made the following statement: "On its face, Section 251 pervasively regulates many aspects of local exchange services, the paradigmatic intrastate market." Application to Vacate Stay at 22, *FCC v. Iowa Utilities Bd.*, No. A-299 (filed Oct. 24, 1996).

phone service has been provided to business and residential customers within a defined geographic area by a single company. Currently, over 1,000 incumbent LECs of widely varying sizes provide local exchange service in countless markets throughout the country. See H.R. Rep. No. 104-204, at 49-50 (1995), *reprinted in* 1996 U.S.C.C.A.N. 10. The Mid-Sized LECs alone range in size from approximately 90,000 to two million access lines as of December 1, 1995; by comparison, the BOCs and GTE range from approximately 14 to 21 million access lines.[4] The local markets served by the incumbent LECs differ dramatically not only in terms of their geography, but also in their topography, demographics, infrastructures, and population densities. Having regulated the LECs throughout much of that more than a century-long time period, state utility commissions are uniquely attuned to the market- and company-specific particularities that materially affect the needs of consumers of local telephone service and the pricing and even physical configuration of service in the local market.

Until recently, it was generally accepted that the provision of local telephone service was a natural monopoly, *i.e.*, that a single telecommunications provider could supply telephone service at a lower cost than could two or more firms. *See* J. Gregory Sidak & Daniel F. Spulber, *Deregulatory Takings and Breach of the Regulatory Contract*, 71 N.Y.U. L. Rev. 851, 867 (1996). Consistent with this widely-held belief, local telephone service has been a regulated monopoly for most of the century, with states enacting legislation protecting incumbent LECs against competitive entry. The right to operate as the exclusive provider of telephone services within a particular market, however, was not without countervailing costs and obligations to the provider. The states, through their utility commissions, have strictly regulated the price and

[4] United States Telephone Ass'n, *Phone Facts* 8-9 (1996), *reprinted in* Appendix to Brief of Mid-Sized Local Exchange Carriers at A-213, *Iowa Utilities Bd. v. FCC*, No. 96-3321 (8th Cir., filed Nov. 18, 1996).

service offerings of intrastate telephone service and imposed "universal service" obligations on LECs, requiring carriers to serve their entire service areas—the densely populated as well as the remote—and all of their citizens, business and residential customers alike. As a result, state regulators have built numerous cross-subsidies into the rate structures of each local exchange market. Any pricing methodology now adopted to unravel those subsidies, therefore, must be designed and implemented in a manner best adapted to the particular local market in order both to achieve vigorous competition *and* maintain universal service to all residents of each local market.

Although most LECs have historically functioned as monopolies within their own geographic markets, virtually every state is served by more than one LEC. For example, 150 incumbent LECs serve Iowa alone.[5] Consequently, state commissions have decades of experience regulating not just the retail prices that LECs charge their customers, but *interconnection* between and among the various LECs under their jurisdictions as well. Without interconnection, a family served by one LEC in a particular town would be unable to place a *local* telephone call to another family served by a different LEC in a neighboring town. Most state commissions have thus developed considerable familiarity with the technical and economic issues that arise when more than one telephone company provides service (although not overlapping service) in the same local telephone market.

As far back as 1934, when Congress passed the Communications Act and created the FCC, Congress recognized and respected the important historical role that state utility commissions had long played as the regulators of intrastate telephone service. Section 2(b) of the Communications Act, which the 1996 Act did not amend, provides that "nothing in this [Act] shall be construed to

[5] United States Telephone Ass'n, *Phone Facts* 7 (1996), *reprinted in* Appendix to Brief of Mid-Sized Local Exchange Carriers at A-212, *Iowa Utilities Bd. v. FCC*, No. 96-3321 (8th Cir., filed Nov. 18, 1996).

apply or to give the [FCC] jurisdiction with respect to (1) charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service by wire or radio of any carrier . . . ." 47 U.S.C. § 152(b). Although the plain language of this section hardly needed any clarification, the Court, in *Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355 (1986) [hereinafter *Louisiana PSC*], confirmed that section 2(b) is a "sweeping" limitation on the FCC's statutory authority that "fences off from FCC reach or regulation intrastate matters—indeed, including matters 'in connection with' intrastate service." *Id.* at 370.

In short, the Communications Act created a dual regulatory regime for telecommunications services, with the FCC given statutory authority to regulate only the interstate aspects of such services. Congress chose to allow the states to retain their historical authority as the sole regulators of intrastate telecommunications services.

2. The development of competition in local telephone markets. Competition in the telecommunications industry began developing in the 1970s in the markets for telephone equipment, information services and long-distance services. S. Rep. No. 104-23, at 2 (1995). Accelerated by the 1984 breakup of AT&T, competition for long-distance services developed and grew. In view of the increasing success of competition in the long-distance market, and with cable companies in particular recognizing that they were well positioned to offer local telephone service, many states began to investigate the prospects of bringing competition to the local exchange market. For example, as early as 1994 the Connecticut legislature had acted to open all telecommunications markets in Connecticut to competition. *See* Conn. Gen. Stat. § 16-247a *et seq.* Further, that state's principal local exchange carrier had already signed a comprehensive agreement with governmental agencies and with numerous competitors (including petitioners AT&T and MCI) governing many aspects of interconnection, network unbundling and physical collocation, leading the state utility commission in 1995 to

comment in approving the agreement that it constituted "irrefutable evidence of the ability to achieve reasonable agreement on issues of common concern to the industry and the public." *In re The Southern New England Telephone Company*, Docket No. 94-10-02, 1995 WL 807764 (Conn. D.P.U.C. Sept. 22, 1995).[6]

Connecticut was hardly alone. Beginning in earnest in 1993 and 1994, numerous states acted to bring competition to their local telephone markets. For example, the Alabama state utility commission entered a local competition order after a full-scale hearing on September 20, 1995.[7] The North Carolina commission entered a similar pro-competition order in 1996, establishing rules governing interconnection, requests for unbundled elements, resale of local service, number portability and certification of competitive local exchange carriers.[8] The North Carolina commission has certified 11 competitors, with 11 more applications pending. New York, Illinois and California also took steps in that time period to open their local markets to competition. S. Rep. No. 104-23, at 5 (1995).[9]

Dec. 20, 1995) (order of California Commission certifying 31 carriers to offer facilities-based local exchange services); *Order re: Competition for Local Exchange Service*, 163 P.U.R. 4th 155, 1995 WL 467996 (Cal. P.U.C. July 24, 1995); *Interim Opinion*, 1996 WL 223624 (Cal. P.U.C. Apr. 10, 1996) (California Commission holding that state regulations concerning number portability are consistent with the Act).

B. The Telecommunications Act of 1996

1. Congress ends the legal telephone monopoly. With knowledge of the states' progress toward deregulation of local exchange markets, Congress passed section 101 of the Telecommunications Act of 1996, which amended the Communications Act by adding new sections 251 through 261, codified at 47 U.S.C. §§ 251-261. Pet. App. 98a-130a. Congress intended that this new part of the Communications Act would provide the citizens of all states the benefits of competition in all sectors of the telecommunications industry, including local exchange service.

At the heart of the local telephone service provisions added by the Act is section 253, by which Congress brought an end to state and local laws giving local telephone providers legal monopoly status. Section 253 thus prohibits all state and local legislation or regulation that prohibits, or has the effect of prohibiting, any entity from providing any interstate or intrastate telecommunications service. 47 U.S.C. § 253(a). Congress recognized, however, that new entrants could not duplicate an incumbent's entire local network infrastructure overnight. It therefore imposed upon incumbents the duty to allow new entrants to interconnect their own facilities with the incumbent's network factilities and to obtain unbundled access to elements, or pieces, of the incumbent's network. 47 U.S.C. § 251(c)(2), (3). As a result, new entrants do not have to duplicate the entire local network infrastructure of loops and switches in order to compete for an incumbent LEC's customers. Instead, new entrants with at least some facilities of their own can interconnect those facilities with the incumbent LEC's local network and can purchase selected pieces of the incumbent's network facilities, without having to construct a complete local exchange network. As an alternative, Congress provided that new entrants without any facilities could purchase an incumbent LEC's finished telephone service and resell it under its own name. 47 U.S.C. § 251(c)(4).

Congress understood, of course, that it could not require incumbent LECs to open their private networks to new entrants without complying with the Fifth Amendment. The Act therefore provides that incumbent LECs can charge rates for interconnection and unbundled access that are "just, reasonable, and nondiscriminatory" and can charge wholesale rates to new entrants seeking only to purchase and then resell an incumbent's finished telephone service. 47 U.S.C. § 251(c)(2)-(4).

2. Congress's deregulatory approach to competition. Congress described the twin goals of the 1996 Act as establishing a "pro-competitive, *de-regulatory* national policy." Joint Explanatory Statement of the Committee of Conference, H.R. Conf. Rep. No. 104-458, at 1, 113 (1996) (emphasis added) (also issued as S. Conf. Rep. No. 104-230 (1996)), *reprinted in part in* 1996 U.S.C.C.A.N. 124 [hereinafter, *Joint Explanatory Statement*]. Congress envisioned that the Act would "reduc[e] regulation of the telecommunications industry . . . [to] spur the development of new technologies and increase investment in these industries." S. Rep. No. 104-23, at 9 (1995); *see id.* at 10 ("By reducing regulation and barriers to competition, the bill will help ensure the future growth of these industries"). The Act thus reflected Congress's "belief that more competition, rather than more regulation, will benefit all consumers." H.R. Rep. No. 104-204, at 50 (1995).

Consistent with its deregulatory approach, Congress consciously and explicitly designed a regime for increasing competition in the local telephone market that provides new entrants with access to the incumbent carrier's existing network and then relies principally upon private, freely negotiated agreements between the entrants and incumbents to determine the precise terms and scope of that access. Thus, the Act requires incumbent LECs and their competitors to negotiate in good faith the terms and conditions of local interconnection and access. 47 U.S.C. §§ 251(c)(1), 252(a)(1). Underscoring its preference for a deregulatory, negotiation-based approach to com-

petition, Congress even provided that the parties could enter into agreements "without regard to the [interconnection and access] standards set forth in subsections (b) and (c) of section 251." *Id.* § 252(a)(1).

In the event voluntary negotiations did not resolve all issues between the parties, Congress provided two alternatives. First, it gave the parties the option of asking a state commission "to participate in the negotiation and to mediate any differences arising in the course of the negotiation." *Id.* § 252(a)(2). Second, it provided that either party to a negotiation may "petition a State commission to arbitrate any open issues." *Id.* § 252(b)(1). Even then, Congress emphasized voluntary negotiation by prohibiting a petition to arbitrate until 135 days after the start of negotiations. *Id.*

3. Congress's decentralization of regulatory authority and preservation of state regulation. Consistent with its adoption of a deregulatory policy for bringing competition to local markets, the 104th Congress also chose a decentralized approach to government regulation of the newly opened local markets. Rather than vesting the FCC with primary responsibility to oversee implementation of the 1996 Act in countless local markets, involving over a thousand local carriers, Congress explicitly placed such authority in the state commissions that were most familiar with those markets and carriers.

Thus, Congress expressly preserved the authority of state commissions to issue regulations implementing the broad standards of the Act (47 U.S.C. § 261(b)) and forbade the FCC from preempting state commission regulations and policies governing the interconnection and access obligations of LECs that were consistent with the broad standards of the Act. *Id.* § 251(d)(3). Congress also vested state commissions with sole responsibility for determining and establishing rates for interconnection and access, including the price of unbundled network elements and wholesale rates for resold services. *Id.* § 252(c)(2), (d). In addition, as previously noted, Congress chose state com-

missions to mediate and, if necessary, arbitrate disputes between LECs and new entrants, and left to state commissions the sole responsibility to approve or reject interconnection and access agreements finalized and submitted by the parties. *Id.* § 252(a)(2), (b), (c). Congress further provided that any party aggrieved by the determination of a state commission with respect to an interconnection agreement could seek review of that determination, not with the FCC, but in federal district court. *Id.* § 252 (e)(6). Congress also foresaw that certain obligations of the Act would place small and mid-sized incumbent LECs at a grave disadvantage when suddenly faced with competition from large, sometimes global entities. It thus gave state commissions the sole authority and broad discretion to modify or suspend Congress's interconnection and access provisions where, among other things, the provisions are "unduly economically burdensome." *Id.* § 251(f)(2).

In short, in numerous provisions of the Act, Congress preserved state commission authority to continue regulating local telephone markets and expressly provided for state commissions, not the FCC, to make critical decisions concerning rates, modifications and waivers, and other local competition matters under the Act. As discussed at greater length under the first Argument heading, Congress's choice to leave regulatory authority principally in the hands of state regulators was deliberate, as reflected not only in the statutory text, but also in the Act's legislative history.

C. The FCC's Rulemaking

The FCC was unwilling to abide by Congress's twin decisions to encourage competition by relying principally on private negotiation backed by state commission mediation and arbitration, and to leave critical regulatory authority over pricing, waivers and other aspects of opening the local markets to competition to the state utility commissions. The FCC even ignored Congress's choice of federal district court review for state commission decisions,

expressly inviting aggrieved parties instead to seek review of those decisions before the FCC.

While some may consider statutory interpretation to be a creative endeavor, it is beyond dispute that the interpretive process should begin with the text of the statute itself. *See Staples v. United States*, 511 U.S. 600, 114 S. Ct. 1793, 1797 (1994); *Northern States Power Co. v. United States*, 73 F.3d 764, 766 (8th Cir. 1996). Yet the FCC rejected this fundamental rule of statutory interpretation in construing the 1996 Act. Instead, the FCC brought a set of presumptions to its interpretation of the Act that have no basis in the language or structure of the Act. Those presumptions led the FCC to imagine that Congress had granted it plenary authority to regulate all aspects of local telecommunications markets, to the virtual exclusion of state regulation. The FCC's predisposition to interpret the Act in this way was first evident in the agency's Notice of Proposed Rulemaking ("NPRM"), published in the Federal Register on April 25, 1996. J.A. 303. There, the FCC announced that the Act created a "new regulatory paradigm" for telecommunications and that Congress intended the FCC, through its rulemaking, to breathe life into that paradigm. J.A. 305. The FCC also announced that the only possible way to bring competition to local telecommunications markets would be through the promulgation of uniform, national rules, since such rules would supposedly produce certain efficiencies that might not be obtained if the state commissions were left to make their own decisions and promulgate their own rules for their home markets. J.A. 313-15.

The FCC's presumptions, while visible in the NPRM, were elevated to a fundamental premise of every aspect of the agency's First Report and Order [hereinafter FRO]. J.A. 403. Paying lip service to Congress's deliberate and bargained-for choice of a deregulatory and decentralized approach to opening local telecommunications markets to competition, the FCC, on August 8, 1996, issued a 700-

page, single-spaced decision that sets forth in minute and mind-numbing detail the agency's view of how it would have brought competition to local markets if it had written the Act. Exploiting what it saw as an opportunity to break from the legal shackles that for decades have barred it from regulating intrastate telecommunications, the FCC issued an order and rules that were revolutionary in scope. Explicit in its mammoth order is the FCC's view that Congress had chosen the FCC to be the new chief regulator and overseer of every local market in the country and that the FCC alone had the knowledge and expertise to determine the future of the numerous local markets and approximately 1,000 incumbent LECs throughout the United States. From the FCC's perspective, uniform national rules—which only it could promulgate—were absolutely essential to efficient implementation of the Act, and without such rules, chaos would reign in local markets and incumbent LECs would purposefully inhibit or delay the efforts of new entrants. FRO ¶¶ 50, 56, 102, 104-20, 179, 625 (J.A. 429, 432, 455-65, 495-96, 721).

In the First Report and Order, two additional critical presumptions of the FCC emerged: (1) Congress's preference for a private, voluntary negotiation-based approach to establishing interconnection and access agreements would never work; and (2) state commissions could not be trusted to fulfill the responsibilities that Congress had expressly entrusted to them under the Act. It would not be unfair to say that the First Report and Order as a whole reflects, at best, a patronizing attitude toward state commissions, and, at worse, utter contempt towards states. This view persists in the Government's briefs as well. For example, in briefs submitted in the Eighth Circuit, the FCC made no apologies for its conclusion that absent its own particular national rules, state commissions "likely would tilt [the terms of competitive entry] in the incumbent monopolists' favor." Mem. of FCC & USA in Opp. to Mot. for Stay at 3, *Iowa Utilities Bd. v. FCC*, No. 96-3321 (8th Cir., filed Sept. 20, 1996).

Indeed, one month before the release of the First Report and Order, the then-Chairman of the FCC candidly admitted that the agency was seeking to consign state regulation of local exchange markets to the "trash can of history." *See* Interview with Reed Hundt, *in* Telecommunications Report, Supp. at 10 (July 9, 1996).

Chairman Hundt was right about the FCC's purpose in issuing the First Report and Order. The following are just several of many examples of the FCC's disdain for state regulation of local telephone markets and for the choices made by Congress in enacting the Act:

- Whereas Congress chose voluntary negotiations as the preferred method of achieving interconnection agreements between incumbent LECs and new entrants (47 U.S.C. § 252(a)(1)), and required incumbent LECs to bargain with new entrants in good faith (*id.* § 251(c)(1)), the FCC concluded that incumbents had no "economic incentive . . . to provide potential competitors with opportunities to interconnect with and make use of the incumbent LEC's network and services." FRO ¶ 55 (J.A. 432). The agency therefore decided that it had no choice but to impose "proxy" prices that, by its own admission, were "presumptive ceilings" that would restrict the scope of voluntary negotiations. *Id.* ¶ 768 (J.A. 790-91).

- Whereas Congress, in 47 U.S.C. § 251(d)(3), expressly constrained the FCC's authority to preempt state interconnection and access regulations and policies, the FCC pronounced *ex cathedra* in a single paragraph of its 700-page First Report and Order that "state regulations that are inconsistent with our rules *may* 'substantially prevent implementation of the requirements of this section and the purposes of [Part II of Title II]'." FRO ¶ 102 (J.A. 456) (emphasis added) (quoting 47 U.S.C. § 251(d)(3)).

- Whereas Congress, in 47 U.S.C. § 251(f)(2), expressly granted state commissions the authority to suspend or modify any of the requirements of 47

U.S.C. § 251(b), (c) for small and mid-sized LECs if a state commission found the requirement to be "unduly economically burdensome" to the LEC, the FCC narrowly restricted the suspension and modification authority of state commissions to situations where the requirement "would be likely to cause undue economic burden *beyond the economic burden that is typically associated with efficient competitive entry*." 47 C.F.R. § 51.405(d) (emphasis added).

- Whereas Congress expressly provided in 47 U.S.C. § 252(c)(2), (d) that state commissions would determine and establish the rates for interconnection and unbundled access to network elements, the FCC established a uniform, national pricing methodology and announced that state commissions were required to adhere to that methodology. FRO ¶ 111 (J.A. 461-62).
- Whereas Congress expressly provided in 47 U.S.C. § 252(e)(6) that a party aggrieved by a determination of a state commission may appeal to the appropriate federal district court, the FCC announced that an aggrieved party "may elect to either bring an action for federal district court review *or* a section 208 complaint to the Commission against a common carrier." FRO ¶ 128 (J.A. 468) (emphasis added).[10]

Together, these regulatory pronouncements of the FCC reflect an agency that simply cannot conceive of a world in which Congress has legislated to open local telecommunications markets to competition but has not given the FCC the central role. In the face of provision after provision of the Act in which Congress gave state commissions, not the FCC, primary regulatory and oversight authority, the FCC audaciously sought to transform a six-month time limitation on issuance of FCC regulations in

---

[10] Section 208 merely gives the FCC jurisdiction to hear complaints "of anything done or omitted to be done by any common carrier." 47 U.S.C. § 208. As argued below, that statute does not authorize FCC review of the regulatory actions taken by state commissions.

section 251(d)(1) into a sweeping and unprecedented grant to the FCC of plenary authority to establish binding regulations regarding *all* aspects of telecommunications services in *all* local markets. With an arrogance that apparently knows no bounds, the FCC announced that its interpretation "is the *only* reasonable way to reconcile the various provisions of sections 251 and 252, and the statute as a whole." FRO ¶ 84 (J.A. 448) (emphasis added).

The FCC was correct that the Act did create a "new regulatory paradigm" in the sense that Congress had decided for the first time to put an end to local telephone providers' legal monopoly and to open all local telephone markets to competition. The Commission fundamentally erred, however, in concluding that Congress had placed the FCC at the center of that paradigm. In fact, Congress had opted to rely principally upon private negotiations, backed up by state commission mediations and arbitrations, as the means of implementing the broad goals of the Act.

D. The Court of Appeals' Decision

On October 15, 1996, the Eighth Circuit, in response to motions of several parties, granted a stay of the FCC's pricing and "pick-and-choose" rules pending final review on the merits.[11] J.A. 224. The FCC and other petitioners applied to this Court twice to vacate the stay, but the Court declined to interfere with the Eighth Circuit's stay. 117 S. Ct. 379 (1996) (Thomas, J., in chambers); 117 S. Ct. 429 (1996). Accordingly, the FCC's pricing rules have not been in effect for nearly two years. After extensive briefing and several hours of oral argument, the court of appeals issued its full decision on the merits on July 18, 1997, and amended that decision on rehearing on October 14, 1997. No party has applied to this Court for a stay of the court of appeals' decision.

---

[11] By order dated September 27, 1996, the Eighth Circuit entered an interim stay of the First Report and Order pending a decision on the motions for stay, so that the rules would not go into effect while the court considered the motions.

In stark contrast to the FCC, whose interpretation of the Act proceeded from the belief that competition could never occur in the absence of its own uniform national rules and that state commissions could not be trusted to execute their responsibilities under the Act, the Eighth Circuit focused its analysis on the plain language of the Act. Moreover, unlike the FCC, the Eighth Circuit engaged in that analysis unfettered by any desire to be at the center of the new local telephone market playing field. It also emphasized at the outset that its "review [did] not encompass any determination regarding the wisdom or prudence of the policies Congress set forth in the Act, those considerations being the Constitutionally-assigned prerogatives of the Legislative Branch of our national government." Pet. App. 8a.

Relying upon the plain language of 47 U.S.C. § 252 (c)(2), (d), the court of appeals held that the Act "undeniably authorize[s] the state commissions to determine the prices an incumbent LEC may charge for fulfilling its duties under the Act." Pet. App. 11a. The court also held that the FCC's blanket preemption of all state rules and regulations that were in any way inconsistent with its own regulations was invalid in light of section 251(d)(3). As the court observed, "The FCC's blanket statement that state rules must be consistent with the Commission's regulations promulgated pursuant to section 251 is not supportable in light of subsection 251(d)(3). With subsection 251(d)(3), Congress intended to preserve the states' traditional authority to regulate local telephone markets and meant to shield state access and interconnection orders from FCC preemption so long as the state rules are consistent with the requirements of section 251 and do not substantially prevent the implementation of section 251 or the purposes of [the Act]." Pet. App. 39a-40a.

The court further held that the FCC had exceeded its statutory authority in promulgating regulations restricting the authority of state commissions under 47 U.S.C. § 251 (f)(2) to modify or suspend certain requirements of the Act for small and mid-sized LECs. Pet. App. 27a-30a.

And the court disagreed with the FCC's claim of authority under 47 U.S.C. § 208 to review interconnection agreements approved by state commissions, holding instead that Congress vested regulatory authority over interconnection agreements solely in the state commissions, subject to a right of appeal to the appropriate federal district court. Pet. App. 30a-34a. In short, the Eighth Circuit rejected the FCC's exaggerated perception of the agency's authority under the Act.

In addition, the Eighth Circuit considered the validity of certain FCC rules concerning the unbundled access and resale provisions of the Act. The FCC took the position in the First Report and Order that a new entrant without any facilities of its own could provide finished telephone service by purchasing from an incumbent *all* of the network elements required to provide such service. FRO ¶¶ 328-41 (J.A. 571-76). The incumbents had argued that the FCC's position eviscerated the distinction between 1) the resale provisions of the Act, pursuant to which a new entrant could purchase an incumbent's finished telephone service at wholesale rates; and 2) the unbundled access provisions, pursuant to which a new entrant could purchase network elements at cost-based rates. Specifically, the incumbents argued that by permitting new entrants to purchase all of the network elements necessary to provide finished telephone service at cost-based rates, the FCC had rendered the resale provisions of the Act a nullity, since no rational new entrant would pay higher wholesale rates for a service that it could purchase at cost.

The Eighth Circuit agreed with the incumbent LECs that any valid interpretation of the Act needed to recognize and maintain the purposeful distinction made by Congress between resale and purchase of unbundled network elements. Pet. App. 71a. Nevertheless, the court upheld the FCC's ruling in the First Report and Order that a new entrant may purchase all of the network elements needed to provide finished telephone service. The court concluded that its vacatur of 47 C.F.R. § 51.315(b)-(f)—which contrary to 47 U.S.C. § 251(c)(3) required incumbents

(rather than requesting carriers) to recombine network elements that are purchased by the requesting carriers on an unbundled basis—would be sufficient to maintain Congress's distinction. Pet. App. 56a-57a, 70a-71a.

E. Impact of the FCC's Rules and the Court of Appeals' Decision on Competition

Consistent with their view that the states cannot be trusted and that private, voluntary negotiations between incumbents and new entrants, backed by state commission arbitrations, cannot work, petitioners predictably claim that the Eighth Circuit's decisions, including its earlier stay of the pricing rules, are somehow responsible for any delay in the achievement of full competition in the local markets. *See, e.g.*, AT&T Pet. 12. Nothing could be further from the truth. Indeed, the Assistant Attorney General in charge of the Justice Department's Antitrust Division has recently testified that competition in the local exchange markets is proceeding forward as fast as one could expect in such a complex matter.[12] The FCC has also elsewhere praised the states for largely adopting on a voluntary basis the FCC's pricing methodology.[13] If, as it contends, most states have *voluntarily* followed the FCC's pricing methodology, the FCC can hardly claim that the Eighth Circuit's decision that the FCC may not *require* states to adopt its preferred methodology has frustrated the pro-competition goals of the Act. To the extent that there has been any undue delay in accomplishing what Congress recognized would be the difficult, complex and time-consuming task of opening all telecommunications

---

Klein, *Bringing Competition to Local Telephony: The Department of Justice's Perspective*, Statement before the Senate Judiciary Committee, Subcommittee on Antitrust, Business Rights, and Competition (Mar. 4, 1998) ("The fact that the market is being opened—albeit more quickly in some places than in others—seems clear from the fact that entrepreneurs are seizing the opportunity to enter a $100 billion market heretofore closed to competition").

[13] *See, e.g.*, Reed Hundt, Chairman, FCC, remarks to the Chamber of Commerce, Washington, D.C. (May 29, 1997) (as prepared for delivery) ("[V]irtually every state in the Union has adopted our [pricing] policies").

markets to full competition,[14] it is attributable in large measure to the FCC's own misguided attempts to displace the pro-competition efforts of various states and to new entrants' singular focus on trying to pick off only lucrative business customers instead of investing in the facilities or services necessary to provide quality local service to all local customers—residential and commercial alike.[15]

Thus, in the months after Congress passed the Act, many state commissions had already moved to adopt rules and policies designed to foster interconnection and access in the manner envisioned by Congress, and many parties were in the process of negotiating agreements to provide interconnection and access. The FCC itself recognized in the NPRM that as of 1996, 19 states had already taken action to open local markets to competition, including seven states in which competing firms had already begun to offer switched service. J.A. 306. *See supra* at notes 6-9 and accompanying text. Moreover, in a contested proceeding after passage of the Act, the Connecticut DPUC concluded that its actions in setting standards for interconnection, unbundled access and resale competition—including its methodology for determining just and reasonable rates—were consistent with the Act.[16] As the Eighth Circuit found, however, the FCC's adoption of its rules, and its attempt to dictate every conceivable contract term and preempt every state rule on pricing and other aspects of interconnection, was leading to the break-

down of negotiations and, absent a stay, would have "derail[ed] current efforts to negotiate and arbitrate agreements under the Act." J.A. 238 (ruling on motions for stay); *see also* Pet. App. 10a n.9.

The Eighth Circuit issued its stay of the pricing and "pick and choose" provisions to permit the negotiations and arbitrations envisioned by the Congress to proceed. And proceed they did. The fact is that nearly 200 interconnection agreements had been signed by February 1997, within four months of the Eighth Circuit's stay opinion. By November 1997, just 20 months after passage of the Act, over 280 companies had voluntarily signed well in excess of 1,700 interconnection agreements to provide local service of some kind in over 450 cities through the country.[17] It should hardly be surprising to anyone that with thousands of interconnection agreements and numerous arbitrations, there should be (as petitioners claim) between 70 and 100 review proceedings in the federal district courts.

Not only have companies negotiated and signed interconnection agreements, but they have also begun to offer local telephone service under the watchful oversight of state commissions, precisely in the manner envisioned by Congress. For example, in Connecticut—one of the first states targeted by petitioners such as AT&T, MCI and others for local competition[18]—the state utility commis-

sion has certified over 36 companies to provide local exchange service and over 200 companies to offer intrastate toll services, and it has ruled that beginning in January 1999 every residential and small business customer of respondent SNET, the incumbent local carrier, will be required to select by ballot which carrier from among SNET and the many certified new entrants it wishes to use for local telephone service. *In re DPUC Investigation of The Southern New England Telephone Company*, Docket No. 94-10-05 (Conn. D.P.U.C. June 25, 1997), *as revised by* Final Decision (Conn. D.P.U.C. Dec. 22, 1997) (not available on Westlaw); *see also DPUC Administration of the Local Exchange Co. Election Process*, Docket No. 97-08-12 (Conn. D.P.U.C., docket opened Aug. 27, 1997) (developing technical standards for balloting in meetings that include representatives of new entrants). Nine of the 36 certified local exchange carriers are currently offering local telephone service in Connecticut, including petitioners AT&T and MCI. Similar competition is occurring in other states' markets. All of this progress toward competition in local markets has occurred without the FCC dictating pricing methodologies to the state commissions and competing carriers and without the FCC preempting every state policy or rule on intervention and access that differs from the FCC's own rules.[19] That progress will continue if the Eighth Circuit's decision is affirmed.

SUMMARY OF ARGUMENT

The Mid-Sized LECs do not question the wisdom of introducing competition to the local exchange market. The question is on whose terms will that competition take

---

[19] For example, respondent Cincinnati Bell Telephone Co. has voluntarily negotiated and entered into, and has arbitrated, numerous interconnection agreements in Ohio, Kentucky and Indiana. MCI and Time Warner are already providing facilities-based local telephone service in Cincinnati. The Nebraska Public Service Commission has certified 13 companies as Local Competition carriers and approved 19 interconnection agreements. *See USTA Competition Report*.

place. Contrary to the position of the FCC, the Mid-Sized LECs, like the Eighth Circuit, believe that it is Congress's terms that should govern.

In constructing its pro-competition, deregulatory framework for ensuring that citizens of all states share in the benefits of competition in local telecommunications markets, Congress expressly eschewed a single set of detailed national rules, recognizing that all local markets and all LECs are not the same—that solutions that work in New York City or in Los Angeles might be disastrous in Des Moines or Fargo, and that requirements that might merely annoy a large national LEC might threaten the very existence of a small or mid-sized LEC. Congress, therefore, sought to take advantage of the local knowledge and experience of state utility commissions in regulating their home markets by giving them, among other powers: (1) the exclusive authority to establish prices where the parties themselves have failed to agree; (2) the sole responsibility to modify or suspend portions of the Act for small and mid-sized LECs; and (3) the explicit right to continue to design and apply their own locally sensitive regulatory policies to ensure fulfillment of the Act's goals. *See* 47 U.S.C. §§ 251(d)(3), (f)(2), 252(c)(2), (d), 261(b).

The 104th Congress would not recognize the detailed, centralized edifice designed by the FCC as the pro-competitive, deregulatory program that Congress passed in February 1996. As the Eighth Circuit correctly recognized, the underlying premise and rationale of the FCC's approach to its jurisdiction over pricing and non-price rules relating to local competition is fundamentally at odds with the language, structure and legislative history of the Act. Under the FCC's vision, the system of private negotiations desired by Congress, backed up by state-run mediation or arbitration, is the wrong way to encourage competition in local markets. Thus, instead of reducing regulatory costs and burdens through private negotiation and preserving traditional state control over countless local

markets and providers of local telephone service, the FCC rules impose a new layer of agency regulation and bureaucratic micro-management. The FCC's rules radically shift local telecommunications regulation from the states to Washington, D.C.; they disable small and mid-sized incumbent LECs from remaining vigorous and innovative competitors in the markets they know best and currently serve; and they inhibit the facilities-based competition that permits companies to distinguish themselves by price, service and technology, the essential ingredients of true competition. In short, as the Eighth Circuit recognized, the FCC's rules are neither pro-competitive nor deregulatory in purpose or effect.

ARGUMENT

I. CONGRESS NARROWLY CIRCUMSCRIBED THE FCC'S REGULATORY AUTHORITY OVER LOCAL TELEPHONE SERVICE.

Petitioners' briefs have two points in common. First, their jurisdictional arguments proceed from a shared premise: because Congress passed legislation to open local telephone markets to competition in states that had not already undertaken that effort on their own, Congress must also have intended that the FCC would have plenary authority to oversee implementation of the 1996 Act. Second, petitioners apparently hope that by merely labeling a host of discrete statutory issues as "jurisdictional," they can obtain review and reversal of the Eighth Circuit's decision on those issues without actually addressing each part of the court's decision in their briefs. These issues include: (1) whether the FCC has authority under 47 U.S.C. § 251(d)(3) to preempt *en masse* all regulatory policies of state commissions enforcing the interconnection and access obligations of section 251; (2) whether the FCC has any power under 47 U.S.C. § 251(f)(2) to constrict the authority given by Congress solely to state commissions to modify or suspend the requirements of section 251(b) or (c) for small and mid-sized LECs; and

(3) whether, under 47 U.S.C. § 208, the FCC may review the decisions made by state commissions when arbitrating, approving or rejecting interconnection agreements under section 252, even though 47 U.S.C. § 252 (e)(6) provides solely for judicial (not FCC) review of state commission determinations.

Contrary to the claim of petitioners, in opening local markets to competition, Congress did not grant the FCC plenary authority to regulate those markets to the virtual exclusion of state commissions who had historically exercised that important responsibility. Instead, as the Mid-Sized LECs show in Part I.A. below, Congress purposely chose an approach that preserved the regulatory authority of state commissions. This is seen not only in the Act's delegation of pricing authority to state commissions, a subject thoroughly explored in the briefs of the BOCs and GTE filed today, but also in the other sections of the Act listed above. These provisions show that Congress made numerous conscious choices about the division of responsibility between federal and state regulators during the drafting and debate of the legislation. As the language and legislative history of each section reveals, Congress consistently chose to amend pending legislation to leave regulatory authority in the hands of state regulators—and not just on pricing issues. Viewed collectively, these additional sections of the Act put the lie to petitioners' claim —which they use specifically to support their pricing jurisdiction arguments—that the guiding principle of the 104th Congress was to replace state regulation of local telephone markets with centralized FCC control from Washington.

Petitioners are also wrong in their apparent belief that if the Eighth Circuit's pricing jurisdiction ruling is reversed, the Court must necessarily also reverse the Eighth Circuit's separate rulings vacating the FCC's construction and application of sections 251(d)(3), 251(f)(2), and 252(e)(6), cited above. In Part I.B., the Mid-Sized LECs address the specific text of each of these critical sec-

tions that petitioners largely ignore in their briefs.[20] Petitioners should not be able to obtain relief in this Court on these matters of great importance without separately addressing the merits of each of these sections.[21] Each of these issues was extensively briefed and argued before the Eighth Circuit and was the subject of a separately reasoned ruling by that court under separate headings in its opinion. Pet. App. 27a-34a, 36a-40a. The Eighth Circuit did not link the different parts of its decision together, so that each would fall if any one of them fell. That court

---

[20] Petitioners mention the Eighth Circuit's decision on these sections only in passing, in footnotes or in parenthetical references in text, devoting virtually all of their argument on FCC "jurisdiction" to the question of whether the Eighth Circuit erred in vacating the FCC's rules concerning pricing. For example, the only parties who discuss the Eighth Circuit's ruling on the scope of section 251(d)(3) are the FCC (Br. 22-23) and respondent GST Telecom, Inc. in support of petitioners (Br. 9-10). Neither the FCC nor GST Telecom, however, devote more than two paragraphs of their briefs to the section. Also, the FCC addresses only in a string cite, without discussion, the Eighth Circuit's ruling on the FCC's rule governing waivers under section 251(f)(2), and the Eighth Circuit's ruling on the FCC's purported authority under section 208 to review state commission determinations under section 252. FCC Br. 26 n.9. Other petitioners give the subject little attention in their arguments. MCI Br. 38 (one paragraph on section 208); AT&T Br. 21 (reference to section 251(f)(2) in string cite); AT&T Br. 31 (one paragraph on section 208).

[21] Petitioners' improper stratagem of sweeping every Eighth Circuit ruling they do not like into their argument on pricing jurisdiction is starkly exposed in AT&T's brief. AT&T takes issue with parts of the Eighth Circuit's decision that vacated FCC rules on wholly non-jurisdictional grounds, even though those parts of the decision are not subsumed in any of the questions presented by AT&T or any other petitioner. AT&T Br. 32-34. AT&T is simply wrong that the Eighth Circuit's decision on these issues was affected by its jurisdictional holding. For example, the Eighth Circuit vacated an FCC rule requiring incumbent LECs, upon the request of a competitor, to provide interconnection and access to the competitor that is superior in quality to what the incumbent provides itself. The court's decision was based on "the plain terms of the Act," Pet. App. 51a, and cannot in any way be described as a "jurisdictional" ruling, as AT&T claims.

understood, as petitioners fail to recognize, that it could not decide the validity of all of the FCC's orders and rules solely on the basis of a discussion of the FCC's power to issue rules generally or pricing rules in particular. The court correctly grounded each of its rulings in the text and legislative history of the particular provision of the Act in question, and not just in the FCC's jurisdictional authority generally as petitioners claim in their briefs. The court's rulings should therefore be affirmed.

A. The Act Preserves State Commission Authority to Regulate the Local Telephone Market.

1. In section after section of the local competition provisions of the 1996 Act, Congress, as it did in the 1934 Act, expressly preserved the historical role of state utility commissions as the regulators of local telephone markets and the numerous companies that provide local service in those markets. Thus, in recognition of the leading role that many states had played in developing regulations and policies that fostered local competition, Congress explicitly barred the FCC in section 251(d)(3) from "preclud[ing] the enforcement of any regulation, order, or policy of a State commission that—(A) establishes access and interconnection obligations of local exchange carriers; (B) is consistent with the requirements of this section; and (C) does not *substantially prevent* implementation of the requirements of this section and the purposes of this part [§§ 251-261]." 47 U.S.C. § 251(d)(3) (emphasis added).

In section 261(b), Congress emphasized more generally that state commissions have a critical responsibility to implement the federal statute. Section 261 provides that nothing in the Act "shall be construed to prohibit any State commission from enforcing regulations prescribed prior to February 8, 1996, or from prescribing regulations after such date of enactment, *in fulfilling the requirements of this part*, if such regulations are not inconsistent with the provisions of this part [§§ 251-261]." *Id.* § 261(b) (emphasis added). In addition, section 252(e)(3) provides that "subject to section 253 [of this title], nothing in

this section shall prohibit a State commission from establishing or enforcing other requirements of state law in its review of an [interconnection] agreement, including requiring compliance with intrastate telecommunications service quality standards or requirements." 47 U.S.C. § 252(e)(3). Sections 253(b) and (c) further confirm the state's continued authority to "preserve and advance universal service, protect the public safety and welfare, ensure the continued quality of telecommunications services, and safeguard the rights of consumers" and to "manage the public rights-of-way." 47 U.S.C. § 253(b), (c). And, significantly, section 601(c)(1) of the 1996 Act (not codified in Title 47) provides that "[t]his Act . . . shall not be construed to modify, impair, or supersede Federal, State, or local law unless expressly so provided . . . ."

Congress also recognized that certain obligations of the Act could place small and mid-sized incumbent LECs at a grave disadvantage when suddenly faced with competition from large, global entities and that state utility commissions, with their knowledge of local markets and local companies, were best positioned to determine whether smaller companies in those local markets needed relief from the Act's requirements. Accordingly, in section 251(f)(2), Congress gave state commissions the sole authority and broad discretion to modify or suspend Congress's interconnection and access provisions where, among other things, they were "unduly economically burdensome," 47 U.S.C. § 251(f)(2), so that companies with far fewer resources than "large global or nationwide entit[ies]" could effectively adjust to the new competitive environment. S. Rep. No. 104-23, at 22 (1995). In crafting the waiver provision, the Senate Committee stated:

> The Committee intends that *the . . . State* shall, consistent with the protection of consumers and allowing for competition, use this authority to provide a level playing field, particularly when a company or carrier to which this subsection applies faces competition from a telecommunications carrier that is a large glo-

> bal or nationwide entity that has financial or technological resources that are significantly greater than the resources of the company or carrier.

Id. (emphasis added).

The text of provisions such as sections 251(d)(3), 261(b) and 251(f) thus affirm the primacy of state commissions as not only the regulators of the local telecommunications markets, but also the regulators of first resort in implementing the broad local competition standards in section 251. Congress's message could not have been clearer: except where expressly provided, the Act does not preempt state commission regulations designed to open local markets to competition. To the extent that Congress granted the FCC any regulatory authority in section 251, Congress explicitly barred the FCC from exercising that authority to preclude enforcement of a state commission's own regulations and policies, unless the FCC finds that the regulations and policies: (1) are inconsistent with the broad standards in section 251 (not the FCC's own regulations); or (2) substantially prevent implementation of the requirements of section 251 and the purposes of the local telephone competition provisions of the 1996 Act.

Section 252 further confirms the Act's orientation toward state regulation of competition in the local exchange market. As noted above, Congress provided that state commissions would mediate and, if necessary and requested by a party, arbitrate open issues between parties negotiating interconnection agreements. 47 U.S.C. § 252(a)(2), (b). In addition to giving state commissions these integral roles in ensuring that private parties reach agreement on interconnection matters, through mediation and arbitration, Congress left to state commissions the sole authority to approve or reject interconnection agreements once they are finalized and submitted by the parties. 47 U.S.C. § 252(e). Congress further provided that any party aggrieved by a determination of a state commission under section 252 "may bring an action in an appropriate Federal district court to determine whether the agreement . . .

meets the requirements of Section 251 and this section." 47 U.S.C. § 252(e)(6).

In those instances when the parties are unable to agree on issues generally, and request arbitration, Congress directed state commissions to ensure that resolution of those issues meets the requirements of section 251, including any of the FCC's validly promulgated and enforceable regulations under section 251. Section 252, however, included requirements wholly apart from those in section 251, and which Congress directed state commissions alone to enforce when conducting arbitrations. In particular, Congress directed state commissions to "establish any rates for interconnection, [resold] services, or network elements according to subsection (d) [of section 252]." 47 U.S.C. § 252(c)(2). In subsection (d), Congress set forth the specific factors that a state commission must use when it makes its rate "[d]eterminations." 47 U.S.C. § 252(d)(1)-(3). Significantly, the provisions of section 252 that directly authorize the state commissions to establish prices in arbitrations are devoid of any reference to FCC regulations.

2. It was no accident that Congress largely preserved traditional state authority over the local exchange market and that it gave state commissions exclusive authority over pricing issues. Rather, it was a purposeful choice reflected in numerous sections of the Act and in its legislative history. Like most legislation, "the Act was the product of many successful compromises among a variety of competing views and interests, and reflects the customary give and take of the legislative process." [22] Perhaps nowhere in the Act, however, are the outcomes of those legislative compromises more clear than in the text of many of the above provisions, as passed by Congress and signed into law by the President. In one provision after another, Congress removed language referring to or giving the FCC

---

[22] Brief of Amici Curiae Congressman Bliley, *et al.*, at 3, *Iowa Utilities Bd. v. FCC*, No. 96-3321 (8th Cir., filed Dec. 23, 1996); *see also* Brief of Amici Curiae Congressman Dingell, *et al.*, *Iowa Utilities Bd. v. FCC*, No. 96-3321 (8th Cir., filed Nov. 15, 1996).

regulatory authority over issues that fundamentally affect the local exchange market.

For example, Congress rejected earlier versions of section 251(f)(2) that had provided for *dual* FCC/state commission authority over decisions to modify or suspend interconnection and access obligations for small and mid-sized LECs, concluding instead that those decisions required a thorough knowledge of the small and mid-sized LECs and the local markets and should thus be handled exclusively by state commissions. *See* S. Rep. No. 104-23, at 22, 93 (1995) (§ 251(i)); H.R. Rep. No. 104-204, at 74, 144 (1995) (§ 252(e)). Thus, on the day that the Senate passed the Act, Senator Daschle (the minority leader) remarked: "The bill before us also recognizes the important role that must be played by Public Utilities Commissions (PUC's) in *rural States*. PUC's are the best entities to judge whether a given market within their State can support competition. *That's not a judgment we should make from Washington.*" 142 Cong. Rec. S709 (daily ed. Feb. 1, 1996) (emphasis added).

Similarly, the House amended H.R. 1555 on the day it passed that bill to add the precursor to section 251(d)(3), which "[p]reserve[s] state access regulations." The House version was identical in every respect to the final text of section 251(d)(3) as later amended in Conference and enacted into law, except that the House originally sought to uphold the enforceability of state commission regulations, orders and policies regarding interconnection and access obligations only if they would "not substantially prevent *the* [*FCC*] from fulfilling the requirements of this section and the purposes of this part." 141 Cong. Rec. H8444, cols. 2-3 (daily ed. Aug. 4, 1995) (inserting new subparagraph (B) in House Commerce Committee's version of section 242(b)(4), reprinted in 141 Cong. Rec. H8427, col. 1) (emphasis added). However, in response to concerns expressed by state commissions,[23] the Confer-

[23] The Chair of the Wisconsin Public Service Commission expressed her concern in a letter to Representative Watts that the House bill reported out of committee wrongfully expanded the

ence deleted reference to the FCC in the above-quoted phrase, leaving section 251(d)(3) as preserving state regulations, orders and policies that do "not substantially prevent implementation of the requirements of this section and the purposes of this part." In short, section 251(d)(3) confirms the states' independent role in executing Congress's plan to introduce competition to the local markets of all states. That role is further confirmed by section 261(b)'s general preservation of state commission authority to promulgate regulations that fulfill the requirements of the local telephone provisions of the 1996 Act, independent of any regulations that the FCC might also promulgate (pursuant to the limited authority Congress gave the FCC).

The legislative history of the Act also confirms what the language and structure of sections 251 and 252 show—that Congress made a conscious choice to reserve exclusive control over pricing issues to state commissions. Earlier versions of the 1996 Act had given the FCC control over pricing, but those provisions were modified in Conference to place pricing standards under the control of state commissions under a new section 252. *See Joint Explanatory Statement* at 13; *see generally id.* at 117-26. In the bill that was enacted into law, Congress made numerous clear distinctions between "the requirements" of section 251 and the separate "requirements of section 252," including the pricing standards set forth in section 252(d). *See, e.g.*, 47 U.S.C. §§ 251(c)(2)(D), (c)(3), 252(e)(2)(B). Although Congress sometimes referred to FCC rules when also referring to the requirements of section 251, it never referred to such rules when separately

---

FCC's authority and that the "manager's amendment" on the House floor, which added the precursor to section 251(d)(3) discussed above in text, "does not give us everything we had asked for, [but] it certainly does a better job of balancing federal and state jurisdiction." The state commission Chair further wrote that "[to] the extent that your efforts would give the states a stronger chance to gain some ground *on the jurisdictional issues in conference committee*, I would tend to support your efforts." 141 Cong. Rec. H8453 (daily ed. Aug. 4, 1995) (emphasis added).

referring to the pricing standards of section 252. *See, e.g., id.* § 252(c)(1), (c)(2), (e)(2)(B), (f)(1), (f)(2).[24]

3. Congress did not leave the FCC without any role to play under the 1996 Act. The requirements of section 251 include several specific references to FCC regulations under that section.[25] At the same time, however, section 251(d)(3) expressly preserves the ability of the state commissions themselves to implement the interconnection and access requirements of section 251, so long as their policies are in keeping with the text of section 251 and the overall purposes of the local competition part of the 1996 Act. On those specific subjects where Congress has authorized the FCC to implement section 251, the FCC may preclude enforcement of a state commission's policies, but only if those state policies do not satisfy the broad guidelines of the Act. Nowhere does section 251(d)(3) reference FCC regulations. Moreover, Congress preserved state commissions' exclusive authority to implement the requirements of section 252, including the arbitration and approval of interconnection agreements and the setting of prices in arbitration. Congress provided that if, but only if, a state commission fails to execute its responsibilities under section 252 with respect to a particular matter, the FCC "shall issue an order preempting the State commission's jurisdiction of that proceeding or matter

---

[24] For example, in 47 U.S.C. § 252(e)(2)(B), Congress provided that a state commission may reject an interconnection agreement adopted by arbitration only if the state commission "finds that the agreement does not meet the requirements of Section 251, including the regulations prescribed by the [FCC] pursuant to Section 251, or the standards set forth in subsection (d) of this section." While the FCC plainly has some regulatory authority under section 251, the breadth of that authority is limited, as described more fully in the briefs filed by the BOCs and GTE.

[25] *E.g.*, 47 U.S.C. § 251(b)(2) (number portability); *id.* § 251(c)(4)(B) (prohibitions on resale); *id.* § 251(d)(2) (network elements); *id.* § 251(e) (numbering administration); *id.* § 251(g) (exchange access); *id.* § 251(h) (treatment of comparable carriers and incumbents).

. . . and shall assume the responsibility of the State commission under this section [252] with respect to the proceeding or matter and act for the State commission." 47 U.S.C. § 252(e)(5).

Put another way, Congress gave the FCC the role of backup regulator of the local exchange market. In those states where regulators are willing and able to take affirmative steps to open their local markets to competition consistent with the broad guidelines established by the Act, Congress permitted those regulators to continue to exercise their historical control without interference from the FCC. However, in states where regulators have abdicated that responsibility and are unwilling either to enforce the congressional mandates of section 251 or to undertake their regulatory responsibilities in section 252 to arbitrate disputes or review interconnection agreements, the FCC may regulate in lieu of the state commission as if it were the state commission. In this way, Congress preserved the historical role of the state commissions as regulators of intrastate telecommunications service, while ensuring that all citizens enjoy the benefits of local competition by permitting the FCC to fill any void left by states that had not acted to open their local markets to competition.[26]

The plain language and legislative history of numerous sections of the Act thus undermine the central premise of petitioners' jurisdictional arguments, including their arguments on pricing—that Congress intended to bring about competition in the local exchange through detailed FCC rules on every conceivable subject that would bind all state commissions throughout the country. To the contrary, viewed as a whole, the Act establishes Congress's clear objective to preserve state commission regulatory

---

[26] An exception to this scheme is found in 47 U.S.C. § 251(e)(1), which grants "exclusive jurisdiction" to the FCC "over those portions of the North American Numbering Plan that pertain to the United States." That reference to the FCC's "exclusive jurisdiction" is the only such reference in section 251.

authority over local telephone markets and to deny the FCC the plenary regulatory authority over those markets that it seeks.

B. The Eighth Circuit's Rulings on the Scope of FCC Authority Under Sections 251(d)(3), 251(f)(2) and 252(e)(6) Are Consistent With the Plain Terms and Legislative History of the Act.

As discussed above, in addition to giving state commissions exclusive authority to establish the rates for interconnection and access, Congress also gave state commissions: (1) the explicit right in section 251(d)(3) to apply their own regulatory policies to implement the broad competition goals of the Act; (2) the sole authority in section 251(f)(2) to waive or modify portions of the Act for mid-sized and small LECs; and (3) the exclusive regulatory authority to approve or reject interconnection agreements, subject only to review in federal district courts under section 252(e)(6). The court of appeals' rulings on each of these sections is independently supported by the text and legislative history of each provision. Contrary to petitioners' suggestions, therefore, the Eighth Circuit's decision on each of these sections must be affirmed regardless of the Court's disposition of petitioners' arguments on the scope of the FCC's jurisdiction over pricing.

1. *Section 251(d)(3) Limits Whatever Regulatory Authority the FCC May Validly Exercise to Implement the Requirements of Section 251.*

The FCC argues that 47 U.S.C. § 251(d)(1) expressly grants it the statutory authority to implement every provision of the local competition portion of the Act. FCC Br. 19; *see also* AT&T Br. 23; MCI Br. 27. As the BOCs and GTE demonstrate in their briefs, Congress's direction to the FCC to establish regulations within six months cannot possibly be transformed into a revolutionary grant of plenary authority to the FCC over every aspect of intrastate telecommunications governed by section 251.[27] How-

[27] By its terms, section 251(d)(1) addresses "the requirements of this section," 47 U.S.C. § 251(d)(1), and therefore does not

ever, regardless of the subject matters that the FCC may permissibly regulate under section 251, and regardless of the statutory source of whatever regulatory authority the FCC may have, the FCC may not ignore the language of section 251(d)(3), which operates as an express limitation upon *any* FCC authority exercised to implement the requirements of section 251. Nevertheless, in its First Report and Order the FCC did just that, by issuing binding, national rules and requiring all state commissions uniformly to adhere to the FCC's rules to the exclusion of the state commission's own rules and policies that may differ from the FCC's. FRO ¶¶ 53-62, 101-03, 179 (J.A. 431-36, 455-56, 495-96). The Eighth Circuit correctly rejected the FCC's attempt to nullify Congress's clear command in section 251(d)(3) to preserve state regulation of interconnection and access. Pet. App. 36a-40a.

The FCC seeks to dismiss section 251(d)(3) as nothing more than a provision to "ensure that state commission orders consistent with federal law are not invalidated on the theory that the Commission's rules preempt a regulatory field." FCC Br. 22. That argument ignores the text of the Act. Congress made absolutely clear in section 261(b) that the Act, which necessarily includes any FCC regulatory authority thereunder, was not intended to have field preemptive effect.[28] Congress did not need to repeat

---

address rulemaking by the FCC to implement the requirements of other sections, such as section 252 (including the pricing standards of section 252(d)). Consequently, section 251(d)(3), like section 251(d)(1), is properly read only to address non-pricing regulations to fulfill the requirements of section 251. However, if petitioners were correct in their erroneous argument that the FCC has authority to issue pricing rules because the requirements of section 251 supposedly incorporate by reference the pricing standards of section 252, then the anti-preemption provision of section 251(d)(3) would necessarily be equally applicable to the FCC's pricing rules.

[28] As previously noted, section 261(b) provides, "Nothing in this part [*i.e.*, sections 251-261] shall be construed to prohibit any State commission from enforcing regulations prescribed prior to February 8, 1996, *or from prescribing regulations after such date of enactment, in fulfilling the requirements of this part,* if such regulations

this point in section 251(d)(3), as the FCC's argument necessarily suggests. Instead, Congress went even further in section 251(d)(3) by limiting the FCC's power to preempt *specific* state regulations, orders or policies. It bears emphasizing that in section 251(d)(3), entitled "Preservation of state access regulations," Congress explicitly barred the FCC, when exercising whatever limited regulatory authority it possesses to implement section 251, from "preclud[ing] the enforcement of any regulation, order, or policy of a State commission that—(A) establishes access and interconnection obligations of local exchange carriers; (B) is consistent with the requirements of this section; and (C) does not *substantially prevent* implementation of the requirements of this section and the purposes of this part [*i.e.*, sections 251-261]." 47 U.S.C. § 251 (d)(3) (emphasis added). Thus, section 251(d)(3) is far more specific, and far more restrictive of FCC authority, than an anti-field preemption provision.

The FCC also claims that because section 251(d)(1) —in the FCC's view—authorizes the FCC to issue regulations to implement the provisions of section 251, the enforcement of any state regulation that is inconsistent with an FCC regulation would by definition "substantially prevent" implementation of the Act. FRO ¶ 103 (J.A. 456). Yet that assertion can succeed only if Congress intended the FCC to be the sole implementor of section 251 or if there were only one reasonable way to implement the broad goals of the Act. For several reasons, neither premise can be sustained.

First, as noted above, section 261(b)—which the FCC does not even cite, let alone discuss, in its brief—provides that state commissions may issue regulations to fulfill the requirements of the Act. In light of this section, any argument that the FCC is the sole entity that Congress authorized to implement the broadly worded goals of the Act is completely without merit. Just as important, sec-

---

are not inconsistent with the provisions of this part." 47 U.S.C. § 261(b) (emphasis added).

tions 261(b) and 251(d)(3) are consistent in permitting state commissions to fulfill the requirements of section 251 (and, for section 261(b), also to fulfill the requirements of section 252) *without regard to FCC regulations.* It does no good for the FCC to point to the language in 47 U.S.C. § 252(c)(1) directing state commissions to ensure that the resolution of open issues in arbitration "meet[s] the requirements of Section 251, including the regulations prescribed by the [FCC] pursuant to Section 251." Under the highly specific and sweeping terms of section 251(d)(3), FCC regulations that are otherwise proper under section 251 are not enforceable to override a state commission's own regulations and policies.[29]

Any other reading of section 252(c)(1) would write section 251(d)(3) out of the Act, which is what the FCC apparently would like to do. However, as discussed at page 31, *supra,* Congress consciously inserted section 251(d)(3) into the Act to address the concerns of state regulators. Congress did not accept the House version of section 251(d)(3) that went into the Conference Committee, which would have limited state regulation to policies that would not "substantially prevent *the FCC from fulfilling* the requirements of this section and the purposes of this part." *See* pages 31-32, *supra.* By removing "the FCC" from the final text of the section, Congress made clear its position that more than one way existed to implement section 251 and that a state regulation could differ from an FCC regulation, yet still be consistent with section 251 and not "substantially prevent" implementation of the goals of the local competition provisions of the Act. *See INS v. Cardoza-Fonseca,* 480 U.S. 421, 442-43 (1987) ("Few principles of statutory construction are more com-

---

[29] As discussed *supra* at page 34 n.26, Congress did grant "exclusive jurisdiction" to the FCC "over those portions of the North American Numbering Plan that pertain to the United States." 47 U.S.C. § 251(e)(1). A state commission would therefore be bound by FCC regulations under that lone provision conferring "exclusive jurisdiction" on the FCC.

pelling than the proposition that Congress does not intend *sub silentio* to enact statutory language that it has earlier discarded in favor of other language") (internal quotations omitted).[30] In short, the FCC's argument on the meaning of section 251(d)(3) is nothing more than an effort to reverse a legislative defeat.

Second, if the FCC were correct that it has plenary power to regulate under section 251 and that the enforcement of any state regulation inconsistent with an FCC regulation would, by definition, "substantially prevent" implementation of section 251, then section 251(d)(3) would once again be a meaningless provision. Under current preemption law, if the FCC did have the plenary regulatory authority it erroneously claims, state rules that were directly inconsistent with the FCC's own rules or that stood "as an obstacle to the accomplishment and execution of the full purposes and objectives of Congress," *i.e.*, rules that "substantially prevented" implementation of the FCC's regulations, would be preempted without the need for section 251(d)(3) to say so. *See Fidelity Federal Savings & Loan Ass'n v. de la Cuesta*, 458 U.S. 141, 153 (1982). Congress obviously included section 251(d)(3), not as a meaningless gesture, but as an express limitation on whatever regulatory authority the FCC was given under section 251.

---

[30] The FCC's construction of the statutory scheme ignores not only the legislative history of the section, but also the established principle of statutory construction that a specific statutory provision prevails over a more general provision. *See Bigger v. American Commercial Lines, Inc.*, 862 F.2d 1341, 1344 (8th Cir. 1988) (*citing MacEvoy Co. v. United States*, 322 U.S. 102, 107 (1944)); *accord Fourco Glass Co. v. Transmirra Prods. Corp.*, 353 U.S. 222, 228-29 (1957). It also ignores this Court's repeated admonition that "we start with the assumption that the historic police powers of the States [are] not to be superseded by [a] Federal Act unless that was the clear and manifest purpose of Congress." *Rice v. Santa Fe Elevator Corp.*, 331 U.S. 218, 230 (1947); *see Arkansas Elec. Coop. Corp. v. Arkansas Pub. Serv. Comm'n*, 461 U.S. 375, 377 (1983) ("the regulation of utilities is one of the most important of the functions traditionally associated with the police powers of the States").

The FCC also argues that there is no valid distinction between a state regulation that is inconsistent with the Act and a regulation that is inconsistent with the FCC's own application of the standards of the Act. FCC Br. 23 n.7. This argument, however, ignores the text of the interconnection and access standards of section 251, which are sufficiently general to sustain differing implementations by state commissions. The FCC and other petitioners concede as much by their reliance on the *Chevron* doctrine of deference in support of the merits of the FCC's rules, which they would not need if the statutory standards were susceptible of only a single interpretation. *See Chevron U.S.A. Inc. v. Natural Resources Defense Council,* 467 U.S. 837 (1984). Thus, as the Eighth Circuit held, a state regulation can be consistent with section 251 if it represents a reasonable approach to implementing that section's requirements, even if the state's method of implementation differs from the FCC's preferred approach. Pet. App. 37a-38a. Section 251(d)(3), therefore, represents an explicit congressional rejection of the usual rule that when a federal and state regulation are in conflict, the federal regulation always prevails.

In the First Report and Order, the FCC sought to avoid the clear implications of sections 251(d)(3) and 261(b) by attempting to discover its preemption authority in section 261(c). FRO ¶ 98 (J.A. 454). The FCC's effort to locate preemption authority in that section, however, is unavailing. Section 261(c) authorizes states to impose additional legal requirements intended to open local telephone markets to competition, so long as those requirements are consistent with this part of the Act (sections 251-261) and any regulations validly promulgated by the FCC under this part. 47 U.S.C. § 261(c). As the Eighth Circuit found, sections 261(b) and 251(d)(3)—unlike section 261(c), which addresses state laws wholly apart from the 1996 Act—deal specifically with state commission regulations that fulfill the requirements of the 1996 Act, not with *additional* state legal requirements. Pet. App. 39a. The FCC cannot minimize the import of Congress's omis-

sion in the anti-preemption provision of section 251(d)(3), and in the preservation of state commission authority in section 261(b), of any requirement that state commission regulations comport with FCC rules. *See Russello v. United States*, 464 U.S. 16, 23 (1983).

Finally, the FCC's reliance upon section 261(c) ignores the settled principle that a specific statutory provision prevails over a more general provision. Section 251(d)(3) is expressly and specifically applicable to every state "regulation, order, or policy" that "establishes access and interconnection obligations of local exchange carriers."[31] By contrast, section 261 lacks this specificity. In addition, section 261(b) expressly addresses the authority of state commissions to prescribe regulations that fulfill the requirements of the 1996 Act. Once again, section 261(c) lacks such specificity. Accordingly, where state regulation of interconnection and access obligations is concerned, section 251(d)(3) must control.

Congress's considered decision to allocate regulatory authority in this manner, and to place express limitations on the FCC's preemption power, also serves to distinguish the cases that the FCC relies upon to support its position —*City of New York v. FCC*, 486 U.S. 57 (1986), and *Fidelity Federal Savings & Loan Ass'n v. de la Cuesta*, 458 U.S. 141 (1982). In neither of those cases did Congress expressly limit the preemptive authority of the federal agency, as it so clearly did here. To the contrary, *de la Cuesta* held that the statutory language authorizing the Federal Home Loan Bank Board to regulate federal savings and loans "suggest[ed] that Congress expressly contemplated, and approved, the Board's promulgation of regulations superseding state law." 458 U.S. at 162. Similarly, *City of New York v. FCC* upheld FCC regulations that established technical standards governing the quality

[31] This reference to the "access and interconnection obligations of local exchange carriers," 47 U.S.C. § 251(d)(3)(A), is a broad, shorthand reference to the numerous obligations of LECs set forth in subsections (b) and (c) of section 251.

of cable television signals and that prohibited local authorities from imposing more stringent technical standards. In so doing, the Court noted, "[i]t is also quite significant that nothing in the Cable Act or its legislative history indicates that Congress explicitly disapproved of the Commission's preemption of local technical standards." 486 U.S. at 67. In sum, in both *de la Cuesta* and *City of New York*, the Court recognized that Congress could have limited the preemption authority of the respective regulatory agencies if it had wanted to, though in each case it did not. In the 1996 Act, however, Congress explicitly did limit the FCC's preemption authority. Congress's choice must be respected.

2. *The FCC Never Determined That Any State Regulation, Order or Policy Was Inconsistent With Section 251 or "Substantially Prevented" Implementation of the Requirement of Section 251 or the Purposes of the Act.*

For an additional reason, the Eighth Circuit correctly rejected the FCC's position that its uniform, national interconnection and access rules are binding on the states: the FCC never actually determined that any particular state regulation, order or policy was, in fact, contrary to the requirements of section 251 or would "substantially prevent" implementation of the requirements of section 251 or the purposes of the local competition provisions of the 1996 Act. To the contrary, the FCC simply pronounced in the First Report and Order that "state regulations that are inconsistent with our rules *may* 'substantially prevent implementation of the requirements of this section and the purposes of [Part II of Title II]'." FRO ¶ 102 (J.A. 456) (emphasis added) (quoting 47 U.S.C. § 251(d)(3)); *see also id.* ¶¶ 177-80 (J.A. 494-96) (new entrants need not "comply with a multiplicity of state variations" in interconnection requirements). The FCC's use of the word "may" in its order is telling and not surprising, since a "substantial prevention" finding would have been impossible given the FCC's failure to examine—or even in the

NPRM to request comments on—whether any particular state's regulations implementing section 251 had actually hindered competition in that state. The FCC simply assumed (as it has here as well), without any basis in the record, that state regulations that differed in any way from its own regulations might have that effect.[32] However, if section 251(d)(3) has any meaning at all, it is that the FCC must make specific findings and conclusions about the real impact of particular state commission regulations, orders and policies on the pro-competitive goals of the Act before issuing or enforcing preemptive regulations.[33]

Yet, the FCC did the one thing that Congress explicitly said it could not do: preempt all state regulations that differed from its own uniform, national rules without first determining whether the state regulations were consistent with section 251 or whether they substantially prevented implementation of that section or the purposes of the Act. Because it failed to take these predicate steps to a preemption order, the Eighth Circuit properly held that the "FCC's blanket statement that state rules must be consistent with the Commission's regulations promulgated

---

[32] Significantly, some state commissions, such as Connecticut's Department of Public Utility Control, have expressly concluded in contested proceedings *after* passage of the 1996 Act that their rules and policies for interconnection, unbundled access to network elements and resale competition—even where different from the FCC's rules—are consistent with the 1996 Act and its goals. See page 20 n.16, *supra*.

[33] Because the FCC did not develop *any* record on the effect of state interconnection and access rules on competition, the FCC's defense of its preemption ruling in this proceeding is necessarily limited to establishing that *all* state commission regulations, orders and policies that differ in any way from the FCC's rules must be preempted on their face. In other words, to uphold the FCC's actions and reverse the Eighth Circuit, this Court would have to find that there is no possible set of circumstances under which a state commission's actions that varied from the FCC's rules would satisfy the requirements of section 251(d)(3). *See California Coastal Comm'n v. Granite Rock Co.*, 480 U.S. 572, 580, 588-89 (1987). There is no basis for making that finding on this record.

pursuant to section 251 is not supportable in light of section 251(d)(3)." Pet. App. 39a.

3. *The FCC Unlawfully Restricted State Commissions' Statutory Authority to Modify or Suspend Obligations for Small and Mid-Sized LECs.*

Further underscoring Congress's confidence in the states, 47 U.S.C. § 251(f)(2) gives to state commissions alone the authority to suspend or modify the requirements of section 251(b) or (c) in certain circumstances for LECs in their state that serve fewer than two percent of the nation's subscriber lines.[34] Those circumstances include when the LEC can demonstrate in a petition filed with the state commission that section 251(b) or (c) imposes "a requirement that is unduly economically burdensome."[35] In purporting to construe section 251(f)(2), the FCC issued Rule 405(d), which impermissibly narrows the circumstances under which Congress intended that a smaller LEC may obtain relief from the requirements of section 251(b) or (c). The rule does so by requiring smaller LECs to prove that a section 251 requirement "would be likely to cause undue economic burden *beyond the economic burden that is typically associated with efficient competitive entry.*" 47 C.F.R. § 51.405(d) (emphasis added) (Pet. App. 307a-308a). Rather than interpreting

---

[34] Under section 251(f)(2), only LECs with fewer than two percent of the nation's subscriber lines in the aggregate qualify for this "2% waiver" provision. That definition includes all of the Mid-Sized LECs. The Mid-Sized LECs have a unique interest in the application of this provision because, unlike smaller, rural LECs that make up the vast majority of LECs in this country, many of the Mid-Sized LECs do not qualify for the automatic rural exemption of 47 U.S.C. § 251(f)(1)—a provision addressed at length in the Brief for the United States Telephone Association and Rural Telephone Coalition ("USTA Brief"), which brief the Mid-Sized LECs fully endorse.

[35] The "unduly economically burdensome" test is just one of three alternative tests in section 251(f)(2) for justifying a waiver, but the FCC conceded below that its rules neither address nor purport to limit a LEC's right to resort to the other two tests.

the statute, the FCC's rule changed the text of the statute, by adding words of limitation to the straightforward phrase used by Congress in the statute.

In other words, if "efficient competitive entry"—the FCC's phrase, not Congress's—would "typically" cause the demise of the smaller LEC with a strong historical tie to its service area, due to the entry of a multinational competitor with no long-term commitment to that area, the FCC's rule would disable the state commission from even temporarily suspending or modifying any of the requirements of section 251. Yet, that scenario is precisely what Congress intended would satisfy the "unduly economically burdensome" test for waivers under section 251 (f)(2). *See* pages 28-29, *supra*. By definition, the numerous small and mid-sized LECs are not "typical," but are each characterized by a unique history and market. The statutory phrase, and not the one made up by the FCC, governs when a state commission may tailor a requirement to the uniquely local situation to *enhance* competition by ensuring the local company's survival.

These defects in the FCC's rule are not surprising given the FCC's own conclusion that its rulemaking record did not afford the agency a sufficient basis to establish national rules governing section 251(f). In its First Report and Order, the FCC found "convincing assertions that it would be an overwhelming task at this time for the Commission to try to anticipate and establish national rules for determining when our generally-applicable rules should *not* be imposed upon carriers." FRO ¶ 1253 (emphasis in original) (J.A. 1020). That finding—which the FCC then promptly ignored by issuing Rule 405(d) as a binding, national rule—comported with Congress's intent in enacting section 251(f), which gives the FCC *no* role to play in that purely local decision. Indeed, Congress deleted any reference to FCC jurisdiction in section 251 (f)(2) and decided instead that waiver decisions requiring a thorough knowledge of small and mid-sized LECs should be handled *only* by state commissions, which are

best equipped to make such determinations on a company-by-company basis, and not from Washington. *See* page 31, *supra*. Once again, the FCC may not claim authority specifically rejected by Congress. *Cardoza-Fonseca*, 480 U.S. at 442-43.

The Eighth Circuit therefore did not need to address the merits of the FCC's rule when vacating it as beyond the FCC's statutory authority. The Eighth Circuit relied on the express statutory text and clear legislative history of section 251(f)(2), which vested regulatory authority over waivers solely in state commissions, and the court independently supported its decision by reference to section 2(b) of the Communications Act. Pet. App. 28a. For these reasons, and for the reasons set forth in USTA's brief, there are no grounds to disturb the Eighth Circuit's ruling vacating Rule 405(d), either on the basis of the text of section 251(f) itself or on broader, jurisdictional grounds.

4. *The FCC Unlawfully Ordered That Parties Aggrieved by a State Commission Determination Under Section 252 May Bypass District Court Review and Seek Review Directly From the FCC.*

In yet another usurpation of a power that Congress did not grant the FCC, the FCC ruled in the First Report and Order that any party dissatisfied with the action taken by a state commission under section 252 to approve or reject a negotiated or arbitrated interconnection agreement may seek review of that state action before the FCC. FRO ¶¶ 121-29 (J.A. 465-69). However, as with its pricing and waiver provisions, Congress nowhere granted the FCC this regulatory power. In section 252, Congress placed each state commission—not the FCC—at the center of responsibility for overseeing the efforts of private parties to enter into agreements for local interconnection, network elements, or services. If negotiating parties remain unsatisfied after a state has acted to arbitrate, approve, or reject interconnection agreements, Congress expressly em-

powered the federal district courts, not the FCC, to review state commission determinations.

Congress could not have made its intent clearer. Thus, section 252(e)(6), entitled "Review of State commission actions," states:

> In any case in which a State commission makes a determination under this section, any party aggrieved by such determination may bring an action *in an appropriate Federal district court* to determine whether the agreement or statement meets the requirements of section 251 of this title and this section.

47 U.S.C. § 252(e)(6) (emphasis added). Congress provided only one venue, "an appropriate Federal district court," for parties aggrieved by state commission determinations.

Despite this clear congressional mandate, the FCC once again sought power that Congress did not give it, and it therefore added words and requirements that Congress never enacted. Thus, while the Act states that parties aggrieved by a state commission determination have a single option, the FCC "conclude[d] that parties have several options for seeking relief." FRO ¶ 124 (J.A. 467). And while the Act states that aggrieved parties must seek review in a federal district court, the FCC "conclude[d] that a person aggrieved by a state determination under sections 251 and 252 of the Act may elect to either bring an action for federal district court review *or* a section 208 complaint to the Commission against a common carrier." *Id.* ¶ 128 (J.A. 468) (emphasis added). Moreover, the FCC made it clear that its assertion of review authority would not be limited to determining whether a common carrier has complied with a state commission determination. It would also extend to reviewing carrier actions *"even if the carrier is in compliance with an agreement approved by a state commission."* *Id.* ¶ 127 (J.A. 468) (emphasis added). In other words, the FCC claims plenary authority to review the terms of state-approved interconnection agreements.

The statutory mechanism for negotiating and approving interconnection agreements under section 252 excludes any direct, or even indirect, oversight role by the FCC. Congress relied on state commissions alone to mediate or arbitrate open issues during negotiations, and regardless whether the parties reach agreement solely through negotiation or through a combination of negotiation and arbitration, Congress required that the agreement be submitted to the state commission for approval or rejection. 47 U.S.C. § 252(e)(1). Congress also specified the standards to be followed by the state commission in determining whether to approve or reject agreements. *Id.* § 252(e)(1)-(4). The state commissions, therefore, have exclusive jurisdiction to determine the validity of such agreements, subject only to review by a federal district court. *Id.* § 252(e)(6).

Congress authorized the FCC to exercise authority over interconnection agreements in one limited instance—where the state commission fails to exercise its responsibilities under section 252. The sole provision authorizing FCC involvement in the process is section 252(e)(5), entitled "Commission to act if State will not act." This statute provides:

> If a State commission fails to act to carry out its responsibility under this section in any proceeding or other matter under this section, then the Commission shall issue an order preempting the State commission's jurisdiction of that proceeding or matter within 90 days after being notified (or taking notice) of such failure, and shall assume the responsibility of the State commission under this section with respect to the proceeding or matter and act for the State commission.

Id. § 252(e)(5). The title and explicit language of this provision could not be clearer: the FCC may enter this area of state concern only if the State commission does not fulfill its specific statutory responsibilties. Even then, the FCC is limited to exercising the same authority that the state commission may exercise under section 252.

These words are unambiguous and must be the starting and ending point of statutory interpretation.

Because Congress expressly excluded the FCC from any role in reviewing state commission determinations, the Court must reject the FCC's attempt to justify its power grab by concocting a new interpretation of its jurisdiction over complaints against interstate common carriers under 47 U.S.C. § 208, a provision that predates the 1996 Act. The FCC's conclusion that "[s]ection 252(e)(6) does not divest the Commission of jurisdiction, in whole or in part, over complaints that a common carrier violated section 251 or 252 of the Act," FRO ¶ 126 (J.A. 468), is premised upon the FCC's mistaken belief that its generalized section 208 complaint jurisdiction already provides the agency with power to adjudicate the new rights, responsibilities and procedures Congress detailed in the Act.

Section 208 does no such thing, for three fundamental reasons. First, the FCC has repeatedly stated that it does not have section 208 jurisdiction to hear complaints relating to *intrastate* matters. *See, e.g., Just Aaron*, 10 FCC Rcd. 11519 (1995); *ACC Long Distance Corp.*, 8 FCC Rcd. 85 (1993); *HAP Services, Inc.*, 2 FCC Rcd. 2948 (1987). As the FCC itself has acknowledged, local exchange service is the "paradigmatic intrastate market." *See* page 3 n.3, *supra*.

Second, the express language of section 208 does not support expanded FCC jurisdiction. That section gives the FCC general jurisdiction to supervise wrongs done by "common carriers." Nothing in that section purports to grant authority to review and override the decisions of a state utility commission. Complaints regarding the arbitration, approval or rejection of an interconnection agreement are all complaints about the state commission's determinations under section 252. The FCC's novel ruling on the scope of section 208 therefore collides with the plain meaning of that provision.

Third, nothing in the Act demonstrates that Congress intended to expand the FCC's complaint jurisdiction under section 208. The FCC therefore relied on an argument

that Congress, in the general savings clause in section 601(c) of the Act (uncodified in Title 47), somehow indirectly modified the express provision for federal district court review in section 252(e)(6), *and* expanded the jurisdictional reach of section 208 to intrastate matters.[36] Again, that assertion of jurisdiction rests entirely upon a contorted and improper reading of section 208 as governing state regulatory action, and an indifference toward Congress's choice that parties aggrieved by state commission actions may seek review only in federal district courts.

The Eighth Circuit overturned the FCC's ruling regarding the scope of its complaint jurisdiction under section 208. The court held that traditional rules of statutory construction require interpreting Congress's choice of federal district court review of state commission decisions as the exclusive means of review. Pet. App. 31a-32a (citing cases). The absence of any reference in section 252 to FCC review reinforced the court's conclusion in this regard. *See id.* at 33a. The court correctly noted:

> The only grant of any review or enforcement authority to the FCC is contained in subsection 252(e)(5), and this provision authorizes the FCC to act only if a state commission fails to fulfill its duties under the Act. The FCC's expansive view of its authority under section 208 is thus contradicted by the language, structure, and design of the Act.

Id. Only after rendering its conclusion based on "the language, structure, and design of the Act" did the court separately and independently hold that section 2(b) of the Communications Act *also* precludes the FCC from exer-

---

[36] In the First Report and Order, the FCC stated: "Section 601(c)(1) of the 1996 Act provides that the 1996 Act 'shall not be construed to modify, impair or supersede' existing federal law—which includes the section 208 complaint process—'unless expressly so provided.' Sections 251 and 252 do not divest the Commission of its section 208 complaint authority." FRO ¶ 126 (J.A. 468). Additionally, the FCC seized on the fact that Congress in section 252(e)(6) omitted the word "exclusive" when it expressly gave jurisdiction to the federal courts to review state determinations. *Id.* ¶ 124 (J.A. 467).

cising authority under section 208 to review state commission decisions on interconnection agreements. It so held because many aspects of those agreements, such as pricing, are outside the FCC's jurisdiction. *See id.* at 33a-34a. The Act's general savings clause in section 601(c) is hardly the straightforward and unambiguous grant of intrastate authority that *Louisiana PSC* requires. *See* 476 U.S. at 377.

Following Congress's explicit choice to limit review of state commission decisions to the federal district courts is particularly important for small and mid-sized LECs. These LECs are especially vulnerable to efforts by large well-financed entrants to grind them down through multiple and duplicative regulatory proceedings. The FCC cannot ignore Congress's plainly expressed intention that parties to an agreement need only pass one regulatory hurdle —the state commission—when entering into interconnection agreements. Accordingly, the FCC should not be permitted to seize regulatory authority over interconnection agreements through the back door of section 208, when Congress itself directly denied the FCC such authority under the Act. The Eighth Circuit was therefore correct to reject the FCC's effort to rewrite section 252 by placing review of state commission determinations within the FCC's jurisdiction.

C. The Text and Structure of the Act as a Whole Undermine Petitioners' Argument that the Act Necessarily Gives the FCC Power to Issue Binding National Rules on Pricing Matters.

As this discussion has demonstrated, there is no basis for petitioners' arguments that Congress rejected the historical model of local telephone regulation and sought to concentrate regulatory authority over the local markets in the FCC. The FCC can argue all it wants that regulation by fiat from Washington is supposedly the most "efficient" way to ensure competition. Congress had other interests to balance when it passed the 1996 Act.

Rather than address all of petitioners' pricing jurisdiction arguments in this brief, the Mid-Sized LECs fully support and incorporate by reference herein the arguments of the BOCs and GTE concerning the FCC's lack of statutory authority to promulgate national pricing rules. It should come as no surprise that Congress listened to the wishes of those who sought to keep pricing authority in the local market solely in the hands of state regulators, where it had always been. Even the FCC concedes that under the Act state commissions retain exclusive regulatory authority over retail rates for local telephone service. FCC Br. 32 n.12. It is hardly a leap in logic to conclude that the 104th Congress had sufficient confidence in the knowledge and abilities of state regulators to permit them to maintain exclusive regulatory authority over the rates that incumbents charge to new entrants as well. After all, the Act expressly states that wholesale rates shall be based upon the retail rates that even the FCC concedes state commissions, and state commissions alone, may set. *See* 47 U.S.C. § 252(d)(3) ("a State commission shall determine wholesale rates on the basis of retail rates"). Furthermore, a key input to any determination of a retail rate is the price charged for interconnection and network elements. Given the state commissions' experience and know-how in analyzing the cost and profit structures of each of the over 1,000 incumbent LECs, it was logical for Congress to give the state commissions exclusive authority to determine the inputs to retail rates in addition to the retail rates themselves.[37]

---

[37] Congress's enactment of a statute preserving state regulatory authority subject to newly enacted federal standards is not novel, and contrary to the claims of petitioner MCI (Br. 40), poses no constitutional problems. *See, e.g., Hodel v. Virginia Surface Mining & Reclamation Ass'n*, 452 U.S. 264, 288-89 (1981) (upholding statute against constitutional challenge), *cited in Printz v. United States*, 117 S. Ct. 2365, 2380 (1997). If a state chooses not to continue to regulate its local telephone market in the manner prescribed in the Act, Congress provided that the FCC would then, and only then, assume the responsibilities of the state commission. 47 U.S.C. § 252(e)(5).

This Court should therefore affirm the Eighth Circuit in its decision to vacate the FCC's pricing rules and the other FCC orders and regulations discussed in Part I of this Argument. Each aspect of the court of appeals' decision, whether it involves pricing, preemption, waivers, or review of state commissions, is independently supported by the text, structure and legislative history of the specific statutory provision at issue and the local competition part of the 1996 Act generally. Furthermore, the court of appeals' well-reasoned construction of section 2(b) of the Communications Act independently supports each aspect of its decision. Though each ruling by the court of appeals on the various orders and regulations stands alone, the court's rulings also support each other and are internally consistent, as they fit with Congress's overall desire to introduce competition into the local telephone markets, not by detailed one-size-fits-all national rules promulgated by the FCC, but by voluntary negotiation and, only when necessary, by state regulation subject to federal district court review.

II. THE FCC'S UNBUNDLING RULES EVISCERATE THE RESALE PROVISIONS OF THE ACT.

There is no disagreement that the Telecommunications Act of 1996 establishes distinct modes for opening local telephone markets to competition for new entrants that lack some or all of the network facilities needed to provide local service—interconnecton with, and use of, unbundled elements of the incumbent's network, or resale. FRO ¶ 12 (J.A. 413). Nor can there be any disagreement that Congress intended the Act to promote facilities-based competition. As one member who later sat on the Conference Committee put it, "it is no exaggeration to say that the entire bill is premised on the existence of robust facilities-based competition." Hearings before House Subcomm. on Telecommunications & Finance of the House Comm. on Commerce, 104th Cong., Serial No. 104-34, at 9 (daily ed. Aug. 4, 1995); *see also* 141 Cong. Rec. H8465 (daily ed. Aug. 4, 1995) (the Act is intended to

"give[] new entrants the incentive to build their own local facilities-based networks, rather than simply repackaging and reselling the local services of the local telephone company"). To encourage facilities-based competition, however, the Act established distinct pricing standards for the two very different modes of competition. Thus, the Act allows new entrants seeking to compete through the use of their own incomplete network facilities to fill in the gaps in those facilities by purchasing, *at cost-based rates*, discrete elements from an incumbent's network. By contrast, those new entrants seeking to compete with an incumbent LEC by doing nothing more than purchasing finished retail telephone services from the incumbent and reselling the services must pay the incumbent a statutorily defined discount from the retail rate (*i.e.*, a *wholesale rate*) to buy the finished service.

There is a disagreement of the most fundamental nature, however, about the impact of the FCC's unbundled access rules upon Congress's careful distinction between resale and the purchase of unbundled network elements. The Mid-Sized LECs and other cross-petitioners contend that the FCC's rules—which permit a new entrant to obtain from a LEC at cost-based rates a fully assembled platform containing all of the network elements necessary to provide finished telephone service—render the resale provisions of the Act a nullity. For if a requesting carrier could simply purchase all of the pre-assembled network elements that an incumbent LEC uses to provide retail telephone service, the carrier (at a minimum) would get the same thing as if it had simply purchased the incumbent LEC's finished telephone service and then resold it without the need for interconnection with the incumbent's facilities. There would, however, be one very critical difference—the requesting carrier would obtain the finished telephone service at the cost-based rates provided for in 47 U.S.C. § 251(c)(3), rather than at the wholesale rate separately provided for in the resale provisions of 47 U.S.C. § 251(c)(4).

The Mid-Sized LECs submit that while the Eighth Circuit's decisions on the issues discussed in Part I of this Argument are correct and should be affirmed, the court of appeals unfortunately erred in concluding that the FCC's rules preserved the congressional distinction between resale and unbundled network elements. For several reasons, the decision of the Eighth Circuit on this critical issue should be reversed.[38]

First, the text of several sections of the Act establishes the obligation of incumbent LECs to provide requesting carriers with access to discrete pieces of their network infrastructure. The duty to provide unbundled access to network elements, however, does not require the incumbent to make available all of the network elements necessary to provide a finished retail service, and it certainly does not require the sale of a fully assembled platform of those elements. Thus, section 251(c)(3) provides, in relevant part, that incumbents shall provide "unbundled network elements in a manner that allows requesting carriers to combine such elements to provide . . . telecommunications service." 47 U.S.C. § 251(c)(3).[39] Section 251(d)(2) expressly limits an incumbent LEC's obligation to provide access to proprietary elements of its network. 47 U.S.C. § 251(d)(2).

---

[38] In supporting their cross-petition on the merits, the Mid-Sized LECs do not wish to repeat all of the arguments made by the BOCs and GTE in support of their cross-petitions. The Mid-Sized LECs therefore respectfully refer the Court to the briefs filed this day by the BOCs and GTE and incorporate the arguments in those briefs by reference.

[39] Notwithstanding the plain language of section 251(c)(3), the FCC's unbundled access rules require the incumbent, not the requesting carrier, to bear the burden and expense of combining unbundled network elements. *See* 47 C.F.R. § 51.315(c)-(f) (Pet. App. 294a); *see also* FRO ¶¶ 294-95 (J.A. 552-53). The Eighth Circuit properly vacated these rules as contrary to the plain language of section 251(c)(3) (Pet. App. 52a-53a, 70a-71a), and the FCC does not challenge that ruling.

Second, the interconnection and unbundled access sections of the Act are integrated, interdependent provisions. Congress plainly intended that a requesting carrier would obtain access to the unbundled elements of an incumbent's network through physical interconnection with the incumbent's network. Thus, the right of interconnection necessarily implies that the requesting carrier has some facilities of its own to interconnect with the incumbent's facilities. Under the FCC's rules, however, a requesting carrier without any of its own network facilities can purchase a fully operational platform of network elements from the incumbent. Indeed, since the FCC has deemed operator and directory assistance services to be network elements, the requesting carrier can even require the incumbent to perform those services on its behalf. The net effect of the Eighth Circuit's acceptance of the FCC's rules is to permit a carrier that has no facilities of its own to obtain finished telephone service at cost-based prices. This necessarily obliterates the distinction between resale and unbundled elements that Congress was careful to create, and without which true competition from facilities-based competitors will never occur.

Third, the FCC's interpretation of the Act can lead only to what Congress itself feared: the inability of small and mid-sized LECs to withstand the economic calamity of new entrants picking off their large business customers by offering telephone service entirely with recombined unbundled elements priced at cost, rather than at an avoided-cost discount from the higher retail rate that state commissions have required LECs to charge business customers to support residential service. The House specifically amended its bill going into Conference to ensure that LECs need only provide resale at "wholesale rates" rather than "at economically feasible rates to the reseller." *Compare* 141 Cong. Rec. H8426 (§ 242(a)(3)) (daily ed. Aug. 4, 1995) *with id.* at H8444, col. 2 ("resale" amendment). Representative Dingell explained that the amendment was necessary to eliminate the requirement

that "local telephone companies . . . subsidize the long distance competitors," by "requir[ing] service which cost $25 to be sold to AT&T for $6; something which would have caused the necessity of subsidizing, then, AT&T at the expense of small business and local [residential] phone user, an outrageous situation." *Id.* at H8452 (also noting that Reps. Bliley and Fields worked to correct "this failure" in the bill).

It is readily apparent from a reading of the First Report and Order that the FCC anticipated that its rules obliging incumbents to provide new entrants with access to the full array of network elements necessary to provide retail telephone service would be attacked for eviscerating the resale provisions of the Act. Accordingly, the FCC sought to justify its rules by arguing that requesting carriers seeking to provide telephone service solely through the purchase of network elements, rather than through resale, assumed economic risks that were not present in the resale context. As a result of these purported risks, the FCC asserted, its rules did not obliterate the Act's resale provisions. Specifically, the FCC stated:

> A carrier purchasing unbundled elements must pay for the cost of that facility, pursuant to the terms and conditions agreed to in negotiations or ordered by states in arbitrations. It thus faces the risk that end-user customers will not demand a sufficient number of services using that facility for the carrier to recoup its cost. . . . A carrier that resells an incumbent LEC's services does not face the same risk.

FRO ¶ 334 (J.A. 573-74).

However, the FCC's economic argument is based on assumptions, not facts. Furthermore, actual experience proves those assumptions to be false. For example, as GTE and several BOCs pointed out to the court of appeals,[40] a number of state commissions have taken the

---

[40] *See* Brief of GTE, SBC Communications, Inc., BellSouth Corporation and US West on Petition for Rehearing at 12 n.3, *Iowa Utilities Bd. v. FCC*, No. 96-3321 (8th Cir., filed Aug. 19, 1997).

position that requesting carriers can purchase or lease network elements on an "on demand" basis. Thus, a requesting carrier that has purchased a network element is only required to pay the incumbent for those times when the network element is actually in use by a customer. Such an arrangement thoroughly undermines the FCC's differential economic risk analysis, which was critical to its argument that its rules do not transform the resale provisions of the Act into mere vestiges.

For the foregoing reasons, the Mid-Sized LECs ask the Court to reject the FCC's position that incumbents must provide requesting carriers with access to *all* of the network elements necessary to provide retail telephone service and to vacate that part of the Eighth Circuit's decision upholding that position. However, if the Court should decide that the Eighth Circuit did not err in affirming the FCC's position, then at a bare minimum the Court must reject the FCC's effort to revive 47 C.F.R. § 51.315(b), which provides, "Except upon request, an incumbent LEC shall not separate requested network elements that the incumbent LEC currently combines." Pet. App. 294a. The Eighth Circuit (*see* Pet. App. 71a) vacated Rule 315(b) as inconsistent with section 251(c)(3) which, by its terms, only obligates incumbent LECs to provide access to network elements on an unbundled, *i.e.*, physically separated, basis.

The FCC and AT&T argue that Rule 315(b) simply prevents an incumbent from imposing gratuitous costs upon a requesting carrier by disassembling network elements that it currently combines, forcing the requesting carrier to bear the expense of reassembling them. FCC Br. 17; AT&T Br. 35-36. Thus, since incumbents already "currently combine" all of the network elements they use to provide finished retail telephone service, they should not be required to disconnect those network elements when the full array is purchased by a requesting carrier. This proffered justification for Rule 315(b) is, however, noth-

ing more than a post-hoc explanation of the Rule invented to create a loophole in the Eighth Circuit's initial decision prior to rehearing.

The FCC's current interpretation of and rationale for Rule 315(b) is quite different from the FCC's view in its First Report and Order. There, the FCC stated that under its interpretation of 47 U.S.C. § 251(c)(3), an incumbent is required to provide "as a single, combined element, facilities that could comprise more than one element. This means, for example, that, if a state commission requires incumbent LECs to provision subloop elements, incumbent LECs must still provision a local loop as a single, combined element when so requested, because we identify local loops as a single element in this proceeding." FRO ¶ 295 (J.A. 553). Thus, through Rule 315(b), the FCC simply sought to prohibit incumbents from unbundling certain network elements that could alternatively be viewed as a combination of several subelements. Nothing in the First Report and Order supports a reading of the rule as requiring an incumbent to turn over a fully assembled platform of network elements at cost-based rates.

However, after the Eighth Circuit invalidated the FCC's rules imposing the obligation to combine network elements on the incumbents (*see* page 55 n.39, *supra*), AT&T suddenly imbued Rule 315(b), which the court of appeals had not initially vacated, with an entirely new meaning. Specifically, AT&T argued in state commission proceedings that because an incumbent LEC "currently combines" all of the elements necessary for providing retail service to its own customers, Rule 315(b) prohibits the LEC from providing elements as separate, unbundled elements and requires the LEC instead to provide those elements "in combined form" at no extra charge.[41]

---

[41] *See* Brief of GTE, SBC Communications, Inc., BellSouth Corporation and US West on Petition for Rehearing at 6 n.1, *Iowa Utiliites Bd. v. FCC*, No. 96-3321 (8th Cir., filed Aug. 19, 1997).

By challenging the Eighth Circuit's invalidation of Rule 315(b), the FCC seeks to reopen a claimed loophole in the court's original decision that the Eighth Circuit properly closed in its decision on rehearing. To the extent that the FCC, AT&T and others viewed Rule 315(b) as requiring an incumbent to provide requesting carriers with a pre-combined platform containing *all* of the network elements necessary to provide finished telephone service, the Eighth Circuit properly rejected that rule as contrary to the "careful distinctions Congress has drawn in [47 U.S.C.] subsections 251(c)(3) and (4)." Pet. App. 71a.

III. THE FCC UNREASONABLY EXPANDED THE DEFINITION OF "NETWORK ELEMENTS."

Just as its rules on access to network elements eviscerated the resale provisions of the Act, the FCC's interpretation of the term "network element" is so unreasonably broad as to render meaningless the distinction between network elements and telephone services themselves. The Eighth Circuit erred in deferring to the FCC's unreasonable construction of this critical term of the Act.

The Act defines a network element as a "*facility or equipment used in the provision* of a telecommunications service," including the "features, functions, and capabilities that are provided *by means of such facility or equipment*, including subscriber numbers, databases, signaling systems, and information sufficient for billing and collection or used in the transmission, routing, or other provision of a telecommunications service." 47 U.S.C. § 153(29) (emphasis added). The crucial distinction that Congress drew between telecommunications "facilities or equipment" and the use of such to provide a telecommunications "service" shows that Congress rooted the definition of "network elements" in the *physical* parts of equipment of a network —loops, switches, etc.—including the "features, functions, and capabilities" provided by those physical elements.

Nevertheless, the FCC's network element rules distort beyond recognition the equipment/service distinction that is at the core of the network element definition. Thus,

significantly, the FCC's rules require incumbent LECs to provide unbundled access to their Operations Support Systems functions ("OSS"). *See* 47 C.F.R. § 51.319(f) (Pet. App. 301a). Those software systems, frequently proprietary in nature, include pre-ordering, ordering, provisioning, maintenance and repair, and billing functions supported by an incumbent's databases. Obviously, these software, databases and support systems are not physical elements of a network. They play no role in the physical delivery (*i.e.*, transmission or routing) of a telephone call. Rather, as their name suggests, they are business *support systems* that an incumbent uses to, among other things, process orders, dispatch repairmen, and keep track of a customer's service requests. Yet, in an invasion into the incumbent's business of extraordinary proportions, the FCC's rules require the incumbent to turn these important management systems over to the incumbent's competitors. The FCC has thus recklessly exposed business management systems that are critical to the operation of the LEC's own business to interface and other demands from the LEC's competitors that may conflict or compromise those systems. Anyone who has attempted the relatively simple task of interconnecting a home computer to an office network should understand the enormity of, and potential risks associated with, what the FCC has done. Congress could not have intended the LEC's competitors to have such unmitigated power over the systems that allow the LEC to control its own business.

The FCC's rules also improperly require incumbent LECs to provide unbundled access to their directory assistance and operator services. *See* 47 C.F.R. § 51.319(g) (Pet. App. 301a). Plainly, human operators are not "facilities or equipment," nor are they "features, functions or capabilities" provided by means of such "facilities or equipment." Requiring incumbents to make these personnel available to competitors obviously has nothing whatsoever to do with unbundling the pieces of the "network" that are actually used to deliver telephone calls. To hold

otherwise would expand the scope of "network elements" to include virtually all of the live support staff that a LEC employs to run its business operation. The absurdity of defining the term so broadly is reflected in an FCC determination that when a requesting carrier, such as AT&T, purchases unbundled access to a LEC operator, the operator must identify himself or herself as an AT&T operator whenever serving an AT&T local service customer. FRO ¶ 537 (J.A. 680). Given this determination, it is no stretch to imagine the FCC next requiring LEC telephone repair personnel to carry different velcro-backed uniform labels with the names of all requesting carriers and to attach the appropriate label to their uniforms whenever providing home repair services to a customer who subscribes to a particular requesting carrier.

Nevertheless, the Eighth Circuit upheld the FCC's characterization of operator services and directory assistance as "network elements" based on a construction of that term that, upon even a cursory inspection, proves to be as unbounded as the FCC's construction. The Eighth Circuit reasoned that because a "telecommunications service" is the "offering of telecommunications for a fee directly to the public" (47 U.S.C. § 153(46)), then any time a facility assists an incumbent in managing the business aspects of its operation, and thus incidentally assists the incumbent in providing retail telephone service, the facility is somehow "used in providing a telecommunications service." Pet. App. 42a-43a. As with the FCC's definition, however, if the court's construction were correct, anything and everything that assists an incumbent in the business aspects of its operation could be deemed a network element. Under the FCC's unbundling rules, all such elements would then have to be made available to a requesting carrier at cost-based rates. For example, office and repair personnel would be network elements, as would office equipment such as desks and personal computers. Once again, Congress could not have intended such an absurd result.

Finally, the Eighth Circuit erred in accepting the FCC's definition of network elements to include a LEC's "vertical services," such as caller ID and call waiting. Pet. App. 41a, 44a-45a. There is no dispute that these services are retail services that LECs must make available to requesting carriers but at wholesale rates. Yet, it is the FCC's position that these services are also discrete network elements that a requesting carrier can purchase from a LEC on an unbundled basis at cost-based rates. Treating vertical services as network elements eviscerates the Act's distinction between resale and unbundled elements and flies directly in the face of legislative history establishing that Congress decided that "services" were *not* to be included in the definition of network elements. *See* H.R. 1555 § 242(a)(2), 104th Cong., 1st Sess. (May 3, 1995) (unbundling provision of House bill originally applied to "services, elements, features, functions, and capabilities," but Conference Committee later eliminated term "services").

The FCC cannot justify the inclusion of caller ID and call forwarding within the scope of a LEC's unbundling obligations by reference to language in the Act's definition of network elements stating that such elements include "*information* . . . used in the transmission, routing, or *other provision* of a telecommunications service." 47 U.S.C. § 153(29) (emphasis added). According to the FCC, the phrase "other provision" expands the category of network elements to include *any* information related to the provision of telecommunications service. FRO ¶ 261 (J.A. 537-38). Such a construction of the Act, however, ignores settled principles of statutory interpretation that require a word to be interpreted in context. In particular, it ignores the principle of *ejusdem generis*, which requires general terms in a statute to be interpreted in accord with more specific terms preceding it. *See, e.g., Federal Maritime Comm'n v. Seatrain Lines*, 411 U.S. 726, 733 (1973). This principle requires the reference to "other provision" to be interpreted in accord with the specific

terms—"transmission" and "routing"—that precede it. The reference to "other provision" thus simply acknowledges that there are a series of discrete functions known by different technical names involved in transmitting a telephone call from one point in a network to another. In addition to "transmission" and "routing" there are signaling, switching, terminating, etc. Rather than reciting an exhaustive list of these terms, the Act uses a shorthand to encompass them all. Vertical services like call waiting and caller ID, however, are not involved in transmitting a call from point to point. Therefore, they are not "network elements," and the Eighth Circuit erred in upholding the FCC's inclusion of those services within the incumbent LEC's obligation to provide access to unbundled network elements.

CONCLUSION

For the foregoing reasons, this Court should affirm the judgment of the court of appeals in *Iowa Utilities Board v. FCC*, except that the Court should reverse the judgment insofar as it upheld the following: (1) the FCC's ruling that entrants—without using any of their own facilities—may rely solely on the purchase of network elements, at cost-based prices, to provide local service; and (2) the FCC's expansion of the statutory definition of network elements to include OSS, directory assistance, operator services, and vertical services.

QUESTION PRESENTED

1. Whether the FCC's Rule 51.315(b) can require incumbent phone companies to provision certain existing combinations of network elements priced at cost pursuant to § 251(c)(3) where such provisioning: (1) is similar to the resale of incumbent services, which is governed by the wholesale pricing standard of § 251(c)(4); and (2) is inconsistent with the Act's purpose of encouraging competitive investment.

ASSOCIATION FOR LOCAL TELECOMMUNICATIONS SERVICES, *et al.*,

Petitioners,

v.

IOWA UTILITIES BOARD, *et al.*,

Respondents.

On Writs of Certiorari to the United States Court of Appeals for the Eighth Circuit

OPPOSING BRIEF ON THE MERITS OF THE ASSOCIATION FOR LOCAL TELECOMMUNICATIONS SERVICES, *et al.*

STATEMENT

The Association for Local Telecommunications Services and certain of its members (hereafter "ALTS and its members") hereby oppose the briefs on the merits filed by AT&T, MCI, and the government concerning the FCC's Rule 51.315(b).[1] Congress created a distinction in the Telecommunications Act of 1996 between the purchase of network elements from incumbents at cost (47 U.S.C. § 251(c)(3)), and the purchase of resold incumbent services

[1] ALTS is a national trade association representing facilities-based providers of competitive local telecommunications services.

at a wholesale discount (*id.* § 251(c)(4)). However, the FCC's Rule 51.315(b), which requires that all existing combinations of network elements be provided at cost, destroys this distinction in those situations where the combinations of network elements being purchased are functionally equivalent to or identical to resold incumbent services. ALTS and its members urge the Court to set aside Rule 51.315(b) because the Rule would "obliterate" the distinctions between sections 251(c)(3) and 251(c)(4) of the Telecommunications Act of 1996.

Accordingly, this Court's remand to the FCC needs to be clear that the Commission is free to craft a new rule addressing combinations that do not resemble resold incumbent services. ALTS and its members continue to support and endorse the positions of AT&T, MCI and the government concerning the FCC's jurisdiction, and the FCC's interpretation of 47 U.S.C. § 252(i). Brief of ALTS filed April 3, 1998, in No. 97-830.

Furthermore, the members of ALTS are currently making substantial capital investments in order to enter local telecommunications markets.[2] This investment is central to the 1996 Act's goal of: ". . . accelerat[ing] rapidly private sector deployment of advanced telecommunications and information technologies and service to all Americans . . . ."[3]

---

[2] Local competitors have raised over $14 billion for local competitive investments since passage of the Telecommunications Act in February of 1996. Bear Stearns Report, March 1998.

[3] Joint Explanatory Statement of the Committee of Conference, H. Rep. No. 104-204, 104th Cong., 2d Sess. at 1 (1996).

The need to encourage this ongoing investment in competitive facilities is not vindicated by Rule 51.315(b). Therefore, ALTS and its members ask that Rule 51.315(b) be reversed and remanded to the FCC with instructions to preserve appropriate incentives for further competitive investments.

Competition Provisions of the 1996 Act

As part of Telecommunications Act of 1996, Pub. L. No. 104-104, 110 Stat. 56 ("1996 Act"), Congress enacted an additional subtitle to the Communications Act, 47 U.S.C. §§ 251-61, for the purpose of developing local competitive markets.[4] This portion of the 1996 Act establishes a framework whereby telephone customers eventually could choose their local carrier in the same way as they choose long distance providers today.

The 1996 Act imposes a duty on all incumbent local exchange carriers ("incumbents") to permit new market participants to utilize the incumbent's network and facilities in order to provide competing local service. In general, the 1996 Act provides three methods by which competitors can enter local telephone markets.

First, section 251(c)(2) directs incumbents to interconnect their local exchange networks with those of competing carriers at "rates, terms, and conditions" that are "just, reasonable, and nondiscriminatory," for the purpose of exchanging traffic with the competing providers.

Second, section 251(c)(3) requires incumbents to allow

---

[4]H.R. Rep. No. 104-204, at 89 (1996).

new entrants to purchase, on an unbundled basis, separate elements of the incumbent local exchange carrier networks at "rates, terms, and conditions" that are "just, reasonable, and nondiscriminatory," and based on cost.

Third, section 251(c)(4) requires incumbents to offer to new entrants their retail exchange services at wholesale rates. Unlike the prices for unbundled elements, which section 251(c)(3) requires be "based on the cost ... of providing" the elements, the wholesale rates for resold services are determined "on the basis of the [incumbent's] retail rates charged to subscribers" minus only the expenses that "will be avoided" by selling at wholesale instead of retail.

Implementing Regulations

The FCC issued a notice of proposed rulemaking to implement the 1996 Act's requirements in accordance with section 251(d)(1) and the FCC's general rulemaking authority. In its *First Report and Order*[5], issued on August 8, 1996, the Commission adopted rules that detailed certain of the pricing and non-pricing requirements of sections 251(c) and 252.

An important issue in the Commission proceedings concerned the possibility that certain combinations of existing elements could be ordered that would be identical to resold services provided by incumbents, but priced at cost under section 251(c)(3) rather than at section 251(c)(4)'s standard for wholesale services. Both incumbents and facilities-based competitors pointed out that the availability of cost-based network elements pursuant to section 251(c)(3) was intended

---

[5] *In re Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, 11 FCC Rcd 15499 (1996) (Joint App. At 403).

to permit facilities-based competitors to "fill-in" portions of their networks, rather than to act as a lower-priced substitute for resold incumbent services. Pet. App. 235a-38a. Arguing that pricing resold services at the level intended for network elements would discourage competitive investments, these parties urged the FCC to adopt some means of preserving the statutory distinction between resale and network elements, such as a requirement that combinations resembling resold services be priced at the resale level rather than at cost.

Rejecting these views, the FCC adopted rules implementing section 251(c)(3), including Rule 51.315(b), under which new entrants could request any existing combination of unbundled elements, including combinations essentially identical to resold services.[6] Pet. App. 230a-33a.

The pricing standards which the Commission finally adopted to implement section 251(c)(3) were based upon forward-looking economic costing principles, and involved solely the pricing of bottleneck network elements from the incumbents.[7] Furthermore, the FCC declined to adopt specific rules as to several important cost determinations,

---

[6] Rule 51.315(b) states: "Except upon request, an incumbent LEC shall not separate requested network elements that the incumbent currently combines."

[7] *See, e.g., Local Competition Order* at ¶ 679: "Congress recognized in the 1996 Act that access to the incumbent LECs' *bottleneck facilities* is critical to making meaningful competition possible;" and at ¶ 740: "The just and reasonable rate standard of TELRIC plus a reasonable allocation of the joint and common costs of providing network elements that we are adopting attempts to replicate, with respect to *bottleneck monopoly elements*, the rates that would be charged in a competitive market" (emphasis supplied).

such as cost of capital, allocations of overhead costs, and depreciation.

The Eighth Circuit's Vacation of Rule 51.315(b)

In the decision under review, the Eighth Circuit held that the FCC had exceeded its jurisdiction by promulgating rules to implement the pricing requirements of sections 251(c) and 252(d) of the 1996 Act, as well as rules related to many non-pricing requirements. As a result, the Eighth Circuit vacated the FCC's rules covering pricing requirements of sections 251(c) and 252(d), including Rule 51.315(c)-(f). The Court held that the FCC had jurisdiction to issue interpretive rules concerning some subsections of section 252. 120 F.3d at 794-95 n.10. Pet. App. at 12a.

In particular, the Eighth Circuit affirmed the FCC's decision to require the provisioning of network elements that could be combined by a new entrant to form a service similar to an incumbent's resold service. Pet. App. at 53a-58a. Having vacated the requirement in Rule 51.315(c)-(f) that incumbents must combine elements upon a new entrant's request, the court concluded that the burden of recombination was adequate to preserve the statutory distinction between sections 251(c)(3) and 251(c)(4): "With resale, a competing carrier can avoid expending valuable time and resources recombining unbundled network elements." Pet. App. at 815.

After issuance of the Eighth Circuit's decision on July 18, 1997, a petition for rehearing was filed asking the court to specifically address Rule 51.315(b). On October 14, 1997, the Eighth Circuit granted the petition because: "To permit such an acquisition of already combined elements at cost based rates for unbundled access would obliterate the careful distinctions Congress has drawn in subsections 251(c)(3) and (4) between access to unbundled network elements on the one

hand and the purchase at wholesale rates of an incumbent's telecommunications retail services for resale on the other." Pet. App. at 71a.

The FCC's *Third Order on Reconsideration* in Its *Local Competition* Proceeding

While ALTS and its members joined other competitive carriers in a broad defense of the FCC's *Local Competition* rules at the Eighth Circuit, subsequent actions by the FCC altered ALTS' understanding of Rule 51.315(b), resulting in this challenge. A short explanation of how the developments informing ALTS' present position came about will assist the Court in its review.

Almost all new entrants have to obtain the bottleneck unbundled network elements needed to provision competitive local services from the incumbent local exchange carriers. However, ALTS' members also purchase and install a substantial portion of their own *non-bottleneck* facilities, such as local switches and certain transport facilities. In this regard they differ from many of the long distance companies, which have not invested to the same degree in local competitive facilities.

Congress clearly intended that the competitive local investments being made by ALTS' members would be furthered by the Commission's implementation of the 1996 Act.[8] First, because these new investments are based on

---

[8] The Joint Explanatory Statement of the Committee of Conference describes the 1996 Act as creating: "a national policy framework designed to accelerate rapidly *private sector deployment* of advanced telecommunications and information technologies and service to all Americans . . . ." H. Rep. No. 104-204, 104th

(continued...)

state-of-the-art technology, they deliver advanced telecommunications services in a more efficient manner than existing facilities. Second, by creating alternative sources of supply, the existence of competitive facilities force the incumbents themselves to be more innovative and efficient.

The goal of inducing investment in competitive facilities is clearly reflected in Congress' creation of separate pricing standards for unbundled network elements under section 251(c)(3), as compared to resold incumbent services under section 251(c)(4). Had Congress intended that resold services be made available at "cost" pursuant to section 251(c)(3), it need not have created a separate statutory mechanism. Furthermore, the availability of resold services at the lower prices usually generated by section 251(c)(3)'s pricing standard would lessen the incentive for new entrants to build their own facilities.

Despite the FCC's rejection of requests to limit the use and pricing of combinations of network elements which are functionally equivalent to resold services (Pet. App. 242a-249a), ALTS and its members believed the Commission had not issued its final word on the important policy issue of the pricing of such elements because the FCC had left open several significant costing issues (cost of capital, depreciation, overhead allocations, etc.) for subsequent determination in individual cases.

This understanding proved unfounded on August 19, 1997, when the FCC issued its *Third Order on Reconsideration* in the *Local Competition* proceeding (the *Shared Transport Order)*, in which the Commission deliberately set the price of two important non-bottleneck UNEs -- local switching and

---

[8](...continued)
Cong., 2d Sess. at 1 (1996)(emphasis supplied).

shared transport -- at levels that automatically flowed through all the incumbents' economies of scope and scale.[9]

The refusal by the FCC to recognize the fundamentally distinct policy concerns between the pricing of bottleneck and non-bottleneck facilities substantially altered ALTS and its members' understanding of Rule 51.315(b). Once the FCC's *Shared Transport Order* demonstrated that the FCC's pricing paradigm for bottleneck facilities would be applied indiscriminately to non-bottleneck network elements, Rule 51.315(b) became a requirement that incumbents provision certain existing combinations (those that resemble resold incumbent services) at prices that conflict with Congress' pricing standard for resold services, and which fail to provide appropriate incentives for competitive investment.

Accordingly, ALTS and its members now ask that Rule 51.315(b) be vacated and remanded to the FCC with instructions that: (1) the Commission remains free to adopt rules involving combinations which do not replicate resold services; and (2) any new rules should fully accommodate the need for the continued encouragement of investment in competitive facilities.

---

[9] *In the Matter of Local Competition Provisions in the Telecommunications Act of 1996, Third Report and Order Upon Reconsideration*, CC Docket No. 96-98 (1997) ("*Shared Transport Order*"): "We note that incumbent LECs have significant economies of scope, scale, and density in providing transport facilities. *Requiring transport facilities to be made available on a shared basis will assure that such economies are passed on to competitive carriers*" (¶ 35; emphasis supplied).

SUMMARY

This Court should start its independent review of Rule 51.315(b) with a focused understanding of the Eighth Circuit's reversal. AT&T, MCI, and the government ("Petitioners"), as well as the incumbents, share an important assumption concerning the Eighth Circuit's logic. They each contend the order on rehearing prevents the FCC from requiring incumbents to provision *any* existing combination of network elements, including those combinations that are not functionally equivalent to services available from the incumbents via resale. Employing this broad reading, Petitioners attack the reversal of Rule 51.315(b) for "confusing" the physical unbundling of network elements with the unbundling of separate prices for those elements. The incumbents happily adopt this expansive interpretation of the decision, and vigorously defend it in the hope of being able to refuse new entrants' requests for any existing combination of network elements.

But this sweeping view incorrectly confuses the court's original determination that incumbents cannot be required to combine network elements (Pet. App. at 52a-53a) with the distinct issue presented in the October 14th Order -- the provision of combinations of elements that are currently combined (Pet. App. at 71a). Concerning the latter, the court's focus was not on the obligation "to recombine network elements that are purchased by the requesting carriers," but rather the manner in which Rule 51.315(b) destroyed the distinction between sections 251(c)(3) and 251(c)(4). Pet. App. at 71a.

Rule 51.315(b) indeed applies to all combinations: " ... an incumbent LEC shall not separate requested network elements that the incumbent LEC currently combines," but, correctly read, the Eighth Circuit's reversal of the rule in no way

implicates all the existing combinations of unbundled elements, only those combinations that so closely resemble resold services that the distinct pricing regimes imposed on each by the statute would be eliminated. As the Eighth Circuit explained: "The combined elements would be equivalent to resale under section 251(c)(3), yet priced at cost pursuant to section 251(c)(4)," a result that would "obliterate the careful distinctions Congress has drawn in subsections 251(c)(3) and (4) between access to unbundled network elements on the one hand and the purchase at wholesale rates of an incumbent's telecommunications retail services for resale on the other." Pet. App. at 71a.

Nothing in the Eighth Circuit's language dealing with Rule 51.315(b) suggests the court was attempting to parse the meaning of "unbundled" as the long distance companies contend. While the Eighth Circuit pointed out that this "obliterat[ion]" would not be permissible even for combinations involving only two network elements, the logic of the court's opinion applies solely to combinations that effectively replicate resold incumbent services, and not to any of the many other existing combinations of network elements.

In addition to being the more natural and narrow reading of the holding below, this interpretation appreciably mitigates the practical concerns of the long distance companies and the government because it would permit the FCC upon remand from this Court to require the provisioning of all existing combinations of elements that do not replicate resold services.

In the event this Court does adopt the decision below on the broad interpretation offered by petitioners and the incumbents, ALTS and its members ask the Court to clarify that its action does not compromise other sources of statutory authority by which the FCC could order incumbents to provision specific combinations of network elements which do

not replicate resold services, including sections 251(c)(6), 214, and 271 of Title II of the Telecommunications Act.

ARGUMENT

I. Reversal of Rule 51.315(b) Implicates Only the Existing Combinations of Network Elements that Resemble Resold Services of the Incumbent Providers.

The many pages of argument in Petitioners' briefs devoted to the Eighth Circuit's reversal of Rule 51.315(b) obscure the short and simple ruling below (Pet. App. at 71a):

> "Section 251(c)(3) requires an incumbent LEC to provide access to the elements of its network only on an unbundled (as opposed to a combined) basis. Stated another way, § 251(c)(3) does not permit a new entrant to purchase the incumbent LEC's assembled platform(s) of combined network elements (or any lesser existing combination of two or more elements) in order to offer competitive telecommunications services. To permit such an acquisition of already combined elements at cost based rates for unbundled access would obliterate the careful distinctions Congress has drawn in subsections 251(c)(3) and (4) between access to unbundled network elements on the one hand and the purchase at wholesale rates of an incumbent's telecommunications retail services for resale on the other. Accordingly, the Commission's rule, 47 C.F.R. §51.315(b), which prohibits an incumbent LEC from separating network elements that it may currently combine, is contrary to § 251(c)(3) because the rule would permit the new entrant access to the incumbent LEC's network elements on a bundled rather than an unbundled basis."

Petitioners locate the Eighth Circuit's core holding in the first sentence above -- "Section 251(c)(3) requires an incumbent LEC to provide access to the elements of its network only on an unbundled (as opposed to a combined) basis." They conclude from this sentence that the court's ruling is grounded on the belief that section 251(c)(3)'s reference to "unbundled" requires only the provisioning of physically separate elements, and does not require the provisioning of existing combinations of elements.[10] Having set up their target, they roll in their dictionaries and launch numerous salvos at the Eighth Circuit's asserted failure to understand that the word "unbundled" can also mean "separately priced."

But this effort to convert the October 14th decision into a misguided parsing of statutory language is totally unfounded. When the first sentence is read in context, it is clear the court was not grounding its reversal of Rule 51.315(b) on any particular meaning of "unbundled" as used in section 251(c)(3). Indeed, the word is never quoted, nor is there even a hint of textual analysis in this portion of the decision. Instead, the court's focus is upon the Rule's "obliterat[ion]" of the pricing distinctions mandated by Congress in situations where incumbents are required to provide existing combinations that resemble resold incumbent services.

---

[10] For example, AT&T sees a confusion of the phase "unbundled" with "separated" or "uncombined" (AT&T Brief at 37). MCI claims the decision means that "any requirement that incumbents provide elements in combination violate[s] the statute" (MCI Brief at 15). *See also* Federal Petitioners' Brief at 44: "The Eighth Circuit invalidated Rule 315(b) principally on the ground that the language of Section 251(c)(3) 'requires an incumbent LEC to provide access to the elements of its network only on an unbundled (as opposed to a combined) basis.'"

Nothing in the decision impairs the FCC's ability to issue rules concerning existing combinations that do *not* resemble resold services, and nothing suggests that section 251(c)(3) is not fully applicable to these combinations.

From start to finish, the Eighth Circuit's sole concern in rejecting Rule 51.315(b) is for the confusion it would produce between resale and unbundled network elements -- a concern that only applies to the existing combinations of elements that resemble resold services.

Beyond the fact that only a narrow view of the reversal of Rule 51.315(b) can be found in the Eighth Circuit's language, ordinary maxims requiring that appellate opinions be interpreted narrowly are underscored in the present context where a complex regulatory scheme is under review. A necessary consequence of the deference to administrative interpretations required under *Chevron, U.S.A., Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837, 844 (1984), is that appellate reversals of agency action should be confined to the particular error identified.

Rule 51.315(b) is a broad rule that requires incumbents to provide requesting new entrants with any and all existing combinations of elements, including combinations which resemble the resold services of the incumbents. The Eighth Circuit upheld a facial challenge to this rule based on the need to preserve the statutory distinctions between resold services and those existing combinations which resemble them. But nothing in the Eighth Circuit's reversal can -- or should -- be interpreted as prohibiting the FCC from revisiting its rule, and requiring the incumbents to provide any and all existing combinations that are *not* similar to resold services. This Court should adopt the Eighth Circuit's understanding of Rule 51.315(b), and reverse and remand the Rule to the Commission for consideration of a new rule that would

exclude combinations resembling resold services.

II. The Eighth Circuit Is Correct that Rule 51.315(b) Would "Obliterate" the Statutory Distinction Between Resold Services and Network Elements.

Once the strawman characterization of the decision below has been cleared away, it is evident the Eighth Circuit was not required to show the "judicial deference to reasonable interpretations by an agency of a statute that it administers" (*National R.R. Passenger Corp.* v. *Boston & Maine Corp.* 503 U.S. 407, 417 (1992)), in light of the Commission's disregard in Rule 51.315(b) for the express statutory distinctions Congress created between the pricing of resold services and network elements. In particular, petitioners' extended discussion of the "discrimination" that allegedly results if existing combinations of elements are not made available at cost pursuant to Rule 51.315(b) is unpersuasive given Congress' express determination in section 251(c)(4) of the pricing standard for resold services. *See, e.g.*, AT&T Brief at 44-46; MCI Brief at 16-19. Furthermore, the few arguments raised by Petitioners that do relate to the Eighth Circuit's actual decision below concerning Rule 51.315(b) are unavailing.

First, Petitioners accuse the court of requiring "artificial" increases in "the cost of using network elements so that leasing network elements would not become a less costly way to enter local markets than resale" (MCI Brief at 22).

But nowhere in the decision below does the court order the FCC or the states to protect the statutory distinction between resold services and network elements solely through price increases on the latter. Indeed, the absence of any such requirement is underscored by the recent action of the New York Public Service Commission, which preserves this

distinction by imposing geographic, market segment, and sunset provisions on network elements that resemble resold services -- and not by imposing price increases on the underlying network elements.[11]

Second, Petitioners attack " ... the court's assumption that there would be an 'inherent' economic advantage in competing via combinations of elements rather than resale . . ." (MCI Brief at 23-24). But the word "inherent" never appears in the court's reversal of Rule 51.315(b), nor is there any assumption -- express or implicit -- that unbundled elements enjoy an economic advantage over resold services. Petitioners' lengthy discussion of how resold services can fully compete with unbundled elements might be apposite if the reviewing court were trying to handicap the different entry vehicle of resale and network elements. But the plain basis for the court's action was the need to preserve the separate statutory identity of each entry mode -- not to tweak the likelihood of success of either.

Third, Petitioners claim there are sufficient non-price distinctions between the resale and network element entry strategies to preserve their separate identity even if Rule 51.315(b) has the effect of destroying Congress distinct pricing scheme for each (AT&T Brief at 46-48; MCI Brief at 23; each citing the *Local Competition Order* at ¶¶ 332-34).[12]

---

[11] *In the Matter of Petition of New York Telephone Company for Approval of its Statement of Generally Available Terms and Conditions Pursuant to Section 252 of the Telecommunications Act of 1996 and Draft Filing of Petition for InterLATA Entry Pursuant to Section 271 of the Telecommunications Act of 1996*, Case No. 97-C-0271 (NYPSC issued April 6, 1998).

[12] "We believe that sections 251(c)(3) and 251(c)(4) present

(continued...)

The FCC paragraphs cited by Petitioners speak only to the non-pricing distinctions that would exist between "carriers using *solely* unbundled elements, compared with carriers purchasing services for resale" (¶ 332; Pet. App. at 244a emphasis supplied).[13] This observation might be entitled to deference if new entrants were actually divided between pure examples of resale entry as opposed to entry through network elements. However, the real world is very different from Commission's hypothetical. New entrants do not make a commitment between either resale or facilities-based entry on a company-wide basis, but rather they determine their entry strategies on a case-by-case basis according to their individual business strategies and the particular economic facts surrounding their entry decisions for specific markets, and sometimes even for specific customers. Thus, because almost all new entrants have the back office systems and financial

---

[12](...continued)
different opportunities, risks, and costs in connection with entry into local telephone markets, and that these differences will influence the entry strategies of potential competitors. We therefor find that it is unnecessary to impose a limitation on the ability of carriers to enter local markets under the terms of section 251(c)(3) in order to ensure that section 251(c)(4) retains functional validity ...." Pet. App. at 244a. In reaching this conclusion, the FCC identified the ability of competitors using "solely unbundled elements" to offer services that are different that those offered by incumbents as the "principal" distinction that preserved the statutory structure. *Id.*

[13] *See also* ¶ 333 (Pet. App. at 244a): "In contrast, a carrier offering services *solely* by recombining unbundled elements can offer services that differ from those offered by an incumbent" (emphasis supplied).

resources to employ either approach in a particular situation, their individual choices between combinations of network elements and resold services are indeed driven by price. The hypothetical model employed by the Commission might be pertinent if competitors were actually forced to choose entry strategies on an "either all this or all that" basis. However, because they actually make their decisions on a far more disaggregated basis, the FCC's attempt to save the statutory structure is not entitled to any deference.

In sum, the FCC's effort to repair its evisceration of section 251(c)(4) is not entitled to deference under *Chevron,* nor could it survive deferential review even if that standard were applicable.

III. Other Statutory Authorities Empower the FCC to Order the Provisioning of Combinations That Do Not Resemble Resold Services.

Even if this Court were to agree with Petitioners and the incumbents that the Eighth Circuit's reversal of Rule 51.315(b) encompassed all combinations of network elements, and not just those combinations that are interchangeable with resold incumbent services, ALTS and its members respectfully ask that the Court take care not to inadvertently cordon off other sources of Commission authority which enable it to order the provisioning of combinations of network elements which do not replicate resold services.

A. The FCC Plainly Has the Authority to Order the Provisioning of Combinations of Network Elements Pursuant to Section 251(c)(6).

Section 251(c)(6) was drafted by the House of Representatives and adopted by the Conference Committee to give the FCC jurisdiction over certain physical collocation

requirements that were called into question in *Bell Atlantic v. FCC*, 24 F.3d 1441 (D.C. Cir. 1994).[14] The *Expanded Interconnection* proceedings that gave rise to *Bell Atlantic* had plainly encompassed the provisioning of what was then the central office equivalent of unbundled network elements -- co-location space, emergency power, cross-connects, etc.[15] Even if this Court were to uphold the Eighth Circuit on the jurisdictional issue and also were to affirm the Eighth Circuit's reversal of Rule 51.315(b) on the broad reading offered by the other parties, this Court should be careful not to compromise the FCC's plenary power to order the provisioning of combinations of network elements pursuant to section 251(c)(6).

B. The FCC Has the Authority to Order Combinations Of Network Elements Under Section 214.

The federal courts have long recognized the FCC's broad authority to condition the issuance of a certificate of convenience and necessity pursuant to section 214. As the incumbents request authority to add to their interstate

---

[14] H.R. Rep. No. 104-104 at 73 (1995)("Finally, this provision [which became section 251(c)(6)] is necessary to promote local competition because a recent court decision indicates that the Commission lacks the authority under the Communications Act to order physical collocation. (See *Bell Atlantic Tel. Co. v. Federal Communications Commission*, No. 92-1619 (D.C. Cir. June 10, (1994))").

[15] *In the Matter of Expanded Interconnection with Local Telephone Co. Faciliities*, 8 FCC Rcd 7369, 7390 (1992)(requiring incumbents to provide central office space and facilities upon an interconnector's request).

investments, the Commission clearly retains the power to require the incumbents to provision those combinations of existing elements that do not replicate resold incumbent services. *See, e.g., MCI v. AT&T*, 462 F. Supp. 1072, 1087 n.14 (N.D. Ill. 1978)("Thus, the FCC may prescribe competitive conditions in the exercise of its authority under Section 214 to grant construction permits for telecommunications facilities").

C. The FCC Has the Authority to Order Combinations of Network Elements Under Section 271.

Section 271 targets a core policy concern of the 1996 Act, the ability of the Bell Operating Companies to exploit their market control over local telecommunications. In order to protect long distance markets from any intrusion of this market power, and to insure that local markets are expeditiously opened to competition, section 271 and its related sections contain detailed provisions about the manner in which the Bell companies can enter long distance.[16]

---

[16] *See, e.g., Application by BellSouth Corporation, BellSouth Telecommunications, Inc., and BellSouth Long Distance, Inc., for Provision of In-Region, InterLATA Services in Louisiana*, CC Docket No. 97-231 (released February 4, 1998); *Application by BellSouth Corp., BellSouth Telecommunications, Inc., and BellSouth Long Distance, Inc., for Provision of In-Region, InterLATA Services in South Carolina*, CC Docket No. 97-208 (released Sept. 30, 1997); *Application of Ameritech Michigan Pursuant to Section 271 of the Communications Act of 1934, as amended, to Provide In-Region, InterLATA Services in Michigan*, CC Docket No. 97-137, Memorandum Opinion and Order, FCC 97-298 (released Aug. 19, 1997); *Application by SBC*

(continued...)

Among the checklist requirements contained in section 271(c)(2)(B)(i) is the requirement that the Bell operating companies provide interconnection in the manner specified by sections 251(c)(2) and 252(d)(1). If this Court agrees that the Commission does have the authority to implement these stautory provisions, then this delegation of authority clearly encompasses the power to order the provisioning of existing combinations of network elements that do not replicate resold services.

---

[16](...continued)
Communications Inc. Pursuant to Section 271 of the Communications Act of 1934, as amended, To Provide In-Region, InterLATA Services In Oklahoma, CC Docket No. 97-121, Memorandum Opinion and Order, 12 FCC Rcd 8685 (1997).

CONCLUSION

For the foregoing reasons, the Court should reverse Rule 51.315(b) and remand the rule to the FCC with instructions that: (1) the Commission remains free to adopt rules involving combinations which do not resemble resold services; and (2) any new rules should fully accommodate the need for continued investment in competitive facilities.

QUESTIONS PRESENTED

The questions presented in these cases are those set forth in our opening brief (at (I)), as well as the following:

4. Whether the Federal Communications Commission reasonably implemented 47 U.S.C. 251(c)(3)—which entitles "any requesting telecommunications carrier" to obtain access to the incumbent carrier's network elements—in determining that requesting carriers may obtain access to such elements as a means of providing telecommunications services whether or not they have constructed some facilities of their own.

5. Whether the Commission reasonably implemented 47 U.S.C. 251(d)(2), which directs the Commission to "consider" certain factors when determining "what network elements should be made available."

6. Whether the Commission reasonably implemented 47 U.S.C. 153(29) and 251(c)(3) in determining that new entrants may have nondiscriminatory access to operational support systems, operator services, and similar network facilities and functionalities.

7. Whether the Commission reasonably implemented 47 U.S.C. 153(29) and 251(c)(3) in determining that new entrants that have obtained access to the switching element also have access to the "vertical features" of that element.

TABLE OF CONTENTS

	Page
Argument	1
I. The Commission's plenary rulemaking authority extends to the local competition provisions of the 1996 Act	1
A. Respondents' view of the Commission's jurisdiction has no coherent textual basis	1
B. The traditional principles of the Communications Act confirm the Commission's jurisdiction	8
C. Respondents' approach would impose immense burdens on potential competitors and the federal courts	15
II. The Commission's rules reasonably implement the 1996 Act's guarantee of nondiscriminatory access to network elements	19
A. Introduction and summary of argument	19
B. The Commission reasonably rejected the incumbents' general proposals for limiting the competitive effects of Section 251(c)(3)	22
1. Rule 315(b) is a reasonable implementation of Section 251(c)(3)	22
2. The Commission reasonably interpreted Section 251(c)(3) not to include an implicit "facilities ownership" requirement	27
3. The incumbents' policy arguments lack merit	30
C. The Commission reasonably applied the statutory definition of "network element" and reasonably determined which elements must be made available	41

Table of Contents—Continued: Page

1. The Commission reasonably applied Section 251(d)(2) 41
2. The Commission's determinations concerning OSS, vertical switching features, and operator services were reasonable 45

In the Supreme Court of the United States

OCTOBER TERM, 1997

FEDERAL COMMUNICATIONS COMMISSION AND THE UNITED STATES OF AMERICA, PETITIONERS

v.

IOWA UTILITIES BOARD, ET AL.

AND RELATED CASES

ON WRITS OF CERTIORARI TO THE UNITED STATES COURT OF APPEALS FOR THE EIGHTH CIRCUIT

REPLY BRIEF FOR THE FEDERAL PETITIONERS AND BRIEF FOR THE FEDERAL CROSS-RESPONDENTS

ARGUMENT[1]

I. THE COMMISSION'S PLENARY RULEMAKING AUTHORITY EXTENDS TO THE LOCAL COMPETITION PROVISIONS OF THE 1996 ACT

A. Respondents' View Of The Commission's Jurisdiction Has No Coherent Textual Basis

1. A proper understanding of this jurisdictional dispute begins with the provision that respondents usher off to the back pages of their discussion (*e.g.*, Bell Atl. Br. 43). Without qualification, Section 201(b) provides: "The Commission may prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this Act." It is undisputed that Congress incorpo-

[1] We refer the Court to the Statement in our opening brief (at 2-15) and to the summary (pp. 19-22, *infra*) introducing Point II below, which addresses the questions presented in cross-petitioners' briefs. "1996 Act" refers to the Telecommunications Act of 1996, Pub. L. No. 104-104, 110 Stat. 56, to be codified in the 1996 Supplement to the United States Code. "Pet. App." refers to the appendix to the petition in No. 97-826.

rated Sections 251 and 252 into "this Act." Together with the Commission's specific obligation to issue expedited regulations "to implement *the requirements*" of Section 251 (47 U.S.C. 251(d)(1) (emphasis added)), Section 201(b) provides the simple and correct answer to every jurisdictional question presented here: In telecommunications regulation, federal rulemaking authority remains coextensive with the substantive scope of federal law, which *once* was confined to interstate matters, but now (as all agree) is not. See pp. 10-11, *infra*.

The easiest way to understand why *respondents'* answer to the jurisdictional question must be *wrong* is to consider a jarring anomaly deep within their exposition of this case. The parties have briefed two basic sets of disputes: disputes about the FCC's statutory jurisdiction to issue rules addressing certain provisions of the 1996 Act, and disputes on the merits about the substantive validity of FCC rules addressing other provisions that undeniably *do* fall within the Commission's jurisdiction. Most of the disputes in the latter category concern the Commission's implementation of the centerpiece of the local competition provisions: Section 251(c)(3), which entitles new entrants to lease network elements of an incumbent telephone company's network at "*rates, terms, and conditions* that are just, reasonable, and nondiscriminatory." 47 U.S.C. 251(c)(3) (emphasis added).

That provision does not itself mention the Commission, much less its jurisdiction to issue the rules challenged here only on the merits. Nonetheless, the premise of half this case, which respondents very much affirm, is that the Commission does have jurisdiction to issue precisely such rules: rules ensuring, in a broad variety of ways, that the "terms and conditions" of access to network elements are "just, reasonable, and nondiscriminatory." The Commission's jurisdiction to issue such rules, however, must come from somewhere, or else this statutory scheme would lapse into incoherence.

The problem for respondents is that any source of *that* jurisdiction necessarily also authorizes the Commission to issue rules addressing the other critical guarantee appearing *in the same statutory phrase*: the guarantee that a new entrant's access to network elements will be provided not just on non-pricing "terms and conditions," but also at "*rates*," that "are just, reasonable, and nondiscriminatory." 47 U.S.C. 251(c)(3) (emphasis added). That is so whether the Commission's jurisdiction to address network elements arises from the Commission's general rulemaking authority under Section 201(b), or from its more specific obligation "to establish regulations to implement *the requirements* of [Section 251]" on a six-month timetable (47 U.S.C. 251(d)(1) (emphasis added)). Under either or both of those sources of authority, the Commission's jurisdiction encompasses each of the words of Section 251(c)(3); it does not stop in mid-sentence.[2]

---

[2] One reason that respondents must and do acknowledge the Commission's authority to address some aspects of Section 251(c)(3) is that a separate provision, Section 251(d)(2), presupposes that authority in addressing the substance of a subcategory of nonpricing network-element issues. Section 251(d)(2) provides: "In determining what network elements should be made available for purposes of subsection (c)(3), *the Commission* shall consider" certain proprietary and other issues (emphasis added). To prop up its argument about pricing jurisdiction, Bell Atlantic is driven to argue (Br. 39) that Section 251(d)(2) alone "necessarily authorizes" the Commission to issue rules implementing Section 251(c)(3). That remarkable contention is unsound on three levels. First, it is countertextual: the subordinate clause at the beginning of Section 251(d)(2) *alludes to* the Commission's jurisdiction but obviously is not an affirmative *grant* of jurisdiction. Second, the contention is self-defeating: if that subordinate clause *were* a jurisdictional grant, the parallel construction in the very next subsection—"In prescribing and enforcing regulations to implement the requirements of this section, the Commission shall not preclude" certain state policies (Section 251(d)(3))—would itself be an affirmative grant of jurisdiction to the Commission "to implement the requirements" of Section 251 *in their entirety*. See also 47 U.S.C. 251(d)(1). Last but not least, Section 251(d)(2) addresses only a subcategory of nonpricing network-element issues: "*what* network elements should be made available" (emphasis added). Bell Atlantic

Put another way, respondents' jurisdictional argument fails not simply because their countertextual interpretation of Sections 201(b) and 251(d)(1) is wrong for the reasons discussed below. It also fails because their interpretation of those provisions *must be* wrong for this Court to make sense of the Commission's undisputed jurisdiction to address the many substantive issues in this case involving access to network elements. And respondents' argument fails not just as a matter of textual compulsion, but also as a matter of common sense: there is no reason why Congress would have intended to centralize national authority in the Commission to make basic regulatory choices concerning only an arbitrary subset of the inextricably interrelated pricing and nonpricing guarantees appearing in the same sentence of Section 251(c)(3). See p. 36, *infra*.

2. Whether the source of the Commission's undisputed jurisdiction to address access to network elements is identified as Section 251(d)(1) or Section 201(b) or both, that jurisdiction is not limited to Section 251(c)(3) (in its pricing and nonpricing aspects) but necessarily also extends—at a bare minimum, under Section 251(d)(1)—to the other substantive provisions of Section 251. Those include the other pricing provisions of Section 251(c), such as the obligation of incumbent LECs to provide interconnection at "*rates* * * * that are just, reasonable, and nondiscriminatory" and to offer services for resale "*at wholesale rates*." 47 U.S.C. 251(c)(2) and (4) (emphasis added); accord 47 U.S.C. 251(b)(5); see also pp. 17-18, *infra* (discussing Sections 251(b)(3) and 251(f)).

Respondents seek to deny the Commission any rulemaking authority to address those pricing standards. They try in two different ways to square that position

---

does not even try to explain how that provision could account for the Commission's unquestioned authority to address the many *other* network-element issues disputed on the merits in this case, see pp. 22-41, *infra*, or, more fundamentally, why the line should be drawn between pricing and nonpricing issues.

with the inconvenient proximity of Section 251's pricing standards to the nonpricing network-element provisions that the Commission has undisputed authority to address. The first strategy, favored by Bell Atlantic, is to assert that no pricing standards appear in Section 251 and to conclude that Section 251 "can have nothing to do with pricing." Br. 24; accord Br. 34-35. That contradicts the statutory text: Section 251(c)(3) addresses, all in the same phrase, the "rates, terms, and conditions" for access to network elements, and Sections 251(c)(2) and 251(c)(4) address, respectively, the "rates" for interconnection and resale. Other respondents acknowledge the rate standards of Section 251(c), but dismiss them as mere "passing reference[s]" (GTE Br. 32) to "just, reasonable, and nondiscriminatory" rates. In fact, however, statutory provisions mandating "just and reasonable" rates have been central to American regulatory law for much of this century, and Congress has commonly employed that very standard in delegating broad pricing authority to federal agencies, including the FCC.[3] That is just what Congress has done here.

Respondents' jurisdictional challenge ultimately boils down, then, to the following proposition: that the inclusion of *additional* pricing standards among the procedural provisions of Section 252 somehow eclipses the pricing standards in Section 251(c) as well as the Commission's authority to address them. That proposition fails not just because Sections 251(c)(2) and 251(c)(3) in fact incorporate "the requirements * * * of section 252" by reference, but also because Section 201(b) *directly authorizes* the Commission to prescribe "regulations * * * to carry out the provisions of this [Communications] Act," which now includes both Sections 251 *and* 252.

---

[3] See, *e.g.*, 47 U.S.C. 205(a) (common carrier rates), 254(b)(1) (universal service); *FPC* v. *Hope Natural Gas Co.*, 320 U.S. 591, 600-603 (1944) (FPC authority over natural gas rates); *Baltimore & Ohio R.R.* v. *Aberdeen & Rockfish R.R.*, 393 U.S. 87 (1968) (ICC au'hority over joint rates).

And even if respondents' reliance on Section 252 did not fail on its own terms, it would still be wrong. As discussed above, under any coherent interpretation of this statutory scheme, the Commission has—at a minimum—jurisdiction to issue rules that implement the pricing standards of Section 251(c), just as it has undisputed jurisdiction to issue rules that implement the nonpricing terms of Section 251(c)(3). The question is how to reconcile that grant of *rulemaking* authority—and each state commission's duty to follow "the regulations prescribed by the Commission" when arbitrating "any open issues" between carriers (47 U.S.C. 252(c)(1))—with Section 252's separate grant of authority to the state commissions to set specific carrier-to-carrier rates in individual *adjudicatory* proceedings. Respondents do not try to conduct that inquiry: they seek to have all pricing authority conferred on the state commissions and to deprive the Commission of any role at all. But "[s]tatutes must be interpreted, if possible, to give each word some operative effect." *Walters* v. *Metropolitan Educ. Enters.*, 117 S. Ct. 660, 664 (1997). The Commission's view of its statutory obligations recognizes the complementary rulemaking and adjudicatory roles of federal and state authorities in implementing the 1996 Act and, unlike respondents' approach, fits the provisions of the Act together to form a coherent whole. See Opening Fed. Br. 28 & n.10; Pet. App. 190a-195a (¶¶ 83-92).[4]

---

[4] Respondents contend (*e.g.*, Bell Atl. Br. 23) that a state commission's duty to adhere to Section 252(d) when arbitrating open *rate* issues, see 47 U.S.C. 252(c)(2), somehow nullifies its primary and quite consistent duty, when arbitrating "*any* open issues," to follow "the requirements of section 251, including the *regulations prescribed by the Commission* pursuant to section 251," 47 U.S.C. 252(c)(1) (emphasis added). As we explain in our opening brief (at 27-28), that contention is illogical: rate issues are "issues." Nor would our position, which avoids that illogic, render Section 252(c)(2) "superfluous" (Bell Atl. Br. 24). To the contrary, that provision directs the state commissions to adhere both to the Commission's rules, which may not be comprehensive, and also to the standards of Section 252(d), which Sections 251(c)(2) and

Drifting from the question presented, respondents also claim that the Commission's actual rules are so specific that they would deprive the States of an important role in implementing the 1996 Act. *E.g.*, GTE Br. 38-39. As an initial matter, the claim is incorrect, as our opening brief explains (at 26-27). To take just one example, while the Commission's methodology for network element rates is based on economic and not historical costs, the state commissions, in applying that methodology, would retain the critical and complex task of determining the economic costs of an efficient telephone network.[5] In any event, respondents' claim is immaterial to the disposition of this jurisdictional dispute. The question before this Court is not whether individual Commission pricing rules are either substantively invalid or sufficiently specific that they cross a hypothetical line between federal rulemaking authority and state adjudicatory authority. The question is whether the Commission may play *any* role at all in giving nationally consistent meaning to these core federal guarantees, a task that would otherwise fall entirely to the federal courts (see pp. 15-17, *infra*). The answer is yes.

(c)(3) incorporate by reference. See also 47 U.S.C. 252(e)(2)(B). Section 252(c)(2) also ensures that the state commissions will apply Section 252(d)(1)'s pricing standards during periods in which, for any reason, the Commission has not issued applicable pricing regulations that have taken effect and been upheld on the merits. But Section 252(c)(2) obviously does not foreclose the Commission from issuing regulations substantively consistent with Sections 251(c) and 252(d). Finally, there is no merit to respondents' use of legislative history (*e.g.*, State Comm'n Br. 25) to argue that the inclusion of some of the Act's pricing terms among the procedural provisions of Section 252 suggests, for reasons not evident on the face of the Act, that the Commission lacks all pricing authority. As petitioner MCI demonstrates (see Opening Br. 32-33), the legislative history points in quite the opposite direction.

[5] As respondents are aware (GTE Br. 15), the Commission's temporary and optional "default proxies" (see J.A. 134 (¶ 623)) were designed for a past period in which no cost studies could have been made available to the state commissions. They have no relevance to this case.

B. The Traditional Principles Of The Communications Act Confirm The Commission's Jurisdiction

Respondents' extensive reliance on Section 2(b) of the Communications Act of 1934, 47 U.S.C. 152(b), is no more persuasive than their account of the 1996 Act.

1. Section 2(b) was designed for a telecommunications world with sharp divisions between the *subjects* of state and federal regulation, a world in which substantive federal law governed the "interstate" component of telecommunications and substantive state law governed the "intrastate" component. To enforce that distinction, Congress provided, in 1934, that "nothing in this Act shall be construed to apply or to give the Commission jurisdiction with respect to * * * intrastate communication service." 47 U.S.C. 152(b).

Respondents attribute extraordinary significance to that provision as a basis for understanding the new telecommunications world created by the 1996 Act. One basic problem with their argument is that, as they concede, the 1996 Act displaces the traditional jurisdictional divide in many critical respects. In particular, although it preserves the state commissions' authority to regulate intrastate retail rates, the 1996 Act pervasively "appl[ies]" to, and repeatedly "give[s] the Commission jurisdiction with respect to," local competition matters, which defy characterization as either "interstate" or "intrastate."

We note some conspicuous examples. Section 253 invalidates every "State or local legal requirement" that "ha[s] the effect of prohibiting the ability of any entity to provide any interstate *or intrastate* telecommunications service," and it directs "the Commission" to "preempt the enforcement of such * * * legal requirement." 47 U.S.C. 253(a), (d) (emphasis added). Sections 251 and 252 themselves displace state law—and impose mandatory *federal* standards —on virtually every regulatory issue associated with opening local markets to competition. Moreover, as all agree, the FCC must issue rules to implement many of those substantive federal standards, and, in arbitrating

disputes between competing carriers, state commissions must "ensure that [their] resolution" of "any open issues * * * meet[s] the requirements" of the Commission's rules. 47 U.S.C. 252(c)(1). Indeed, the Commission's obligation to issue such preemptive federal rules is not even discretionary. Section 251(d)(1) compels the Commission to issue expedited rules implementing "the requirements" of Section 251, and the new "forbearance" provision further provides that "the Commission may not forbear from applying the requirements of section 251(c) * * * until it determines that those requirements have been *fully implemented*." 47 U.S.C. 160(d) (emphasis added); see Opening Fed. Br. 24-25.[6]

In sum, in local competition matters, Congress has now displaced the traditional jurisdictional divide, even though it saw no need to amend Section 2(b) to reflect the many respects, most of them undisputed, in which that is true. The 1996 Act adopts a new jurisdictional approach that simultaneously extends federal authority into the intrastate sphere *and* extends state authority into the interstate sphere—an approach under which federal and state authorities work together in complementary rulemaking and adjudicatory capacities in applying federal law to the same subjects. See Opening Fed. Br. 26-27, 37. Respondents cannot seriously dispute that fact: to restate an obvious example, the premise of five of the seven questions presented in this Court is that, despite Section 2(b), the Commission has jurisdiction to issue rules, which the state commissions must apply in arbitration, concerning a new entrant's access to network elements. That new jurisdictional model can and should be understood on its own terms, not by reference to the jurisdictional divide that it displaces.

---

[6] Contrary to the suggestion of some respondents (*e.g.*, Bell Atl. Br. 41 n.22), petitioners did not somehow waive reliance on the "forbearance" provision below, and the Eighth Circuit in fact addressed the provision on the merits. See Pet. App. 86a.

2. Moreover, respondents' reliance on Section 2(b) would be unsound even if the appropriate point of reference were that traditional jurisdictional divide. First, respondents' approach would improperly place Section 2(b) in unnecessary conflict with Section 201(b). Second, as discussed below (see pp. 11-15), the matters at issue here defy characterization as "intrastate" in any event.

Section 201(b) provides: "The Commission may prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this Act." It is undisputed that "this Act" includes all relevant portions of the 1996 Act, including Sections 251 and 252. See Opening Fed. Br. 19-20 & n.5 (discussing codification); see also 47 U.S.C. 251(i) ("savings provision" preserving "Commission's authority under Section 201"). To resist the logical conclusion—that Section 201(b) authorizes the Commission to issue rules addressing Sections 251 and 252—respondents observe only that the original substantive scope of the Communications Act was confined to "interstate" matters, as indicated by Section 201*(a)*. *E.g.*, Bell Atl. Br. 43. But of course it does not follow that the Commission's rulemaking authority is forever confined to what the Act's substantive scope used to be. Instead, Section 201(b) makes that rulemaking authority coextensive with whatever substantive boundaries Congress has fixed for the Act. Under Section 201(b), as Congress has extended the scope of the Act to local competition matters, it has extended the scope of the Commission's rulemaking authority to those matters as well.

Here, federal law indisputably *applies* to the regulatory matters at issue, despite Section 2(b)'s primary prohibition against "construe[ing]" the Act "to apply" to intrastate matters. 47 U.S.C. 152(b). Wherever federal law applies, Section 201(b) "straightforward[ly]" gives the Commission coextensive rulemaking authority: and that is the end of the inquiry. See *Louisiana Pub. Serv. Comm'n* v. *FCC*, 476 U.S. 355, 377 (1986). Respondents nonetheless retreat to Section 2(b)'s disjunction—"nothing in this Act

shall be construed to apply *or* to give the Commission jurisdiction with respect to" intrastate matters (emphasis added)—and argue that the second half of that phrase survives the displacement of the first half in the many matters now governed by federal law. In their view, the second half must survive, and must cancel out much of Section 201(b), if the word "or" is to have "effect" (GTE Br. 45).

It is not so. To give "effect" to Section 2(b)'s disjunction, it is unnecessary to violate Section 201(b) by detaching the Commission's rulemaking authority from the scope of federal telecommunications law. Instead, the disjunction's intended effect, which is consistent with Section 201(b), is to prohibit the Commission from exercising regulatory jurisdiction over intrastate matters arguably related to, but *not* expressly covered by, substantive federal law. The extent to which Section 2(b) limits the Commission's exercise of jurisdiction in *those* circumstances was the sole subject of this Court's analysis in *Louisiana*, despite respondents' efforts to wring greater significance out of that case. Indeed, as the Eighth Circuit recognized, the question posed here is the exact "opposite" (Pet. App. 19a) of the question decided in *Louisiana*: here, the substantive applicability of federal law is clear, and the question is what role the Commission may play in implementing it. *Louisiana* nowhere suggests that, despite the plain language of Section 201(b), the Commission's rulemaking authority is narrower than the explicit substantive reach of the Communications Act.

3. Finally, respondents' reliance on Section 2(b) is misdirected because the crucial matters at issue here defy characterization as "intrastate."

Respondents' objective in this litigation is far broader than the objective they profess. They claim to seek only the preservation of traditional state control over intrastate communications. *E.g.*, GTE Br. 11. That characterization is wrong for several reasons: to begin with, introducing competition into local markets is not a tradi-

tional subject of state concern—that is one reason why monopolists still enjoy 98% of local revenues (see Opening Fed. Br. 41)—and the jurisdictional dispute in this case is not about the preservation of substantive state law in any event. But respondents have mischaracterized their objective on a still deeper level. The central regulatory areas in which they seek to deny the FCC any rulemaking role are no more accurately characterized as "intrastate" than as "interstate," and, in extending their logic to the implementation of Section 271's long-distance provisions, they have waged an offensive against the core of the Commission's interstate authority. See pp. 14-15, *infra*.

Consider, first, the subject of the parties' substantive disputes about Section 251(c)(3)'s guarantee of nondiscriminatory access to network elements, the centerpiece not just of this litigation but of the local competition provisions themselves. Those disputes concern a new entrant's right to lease network elements (such as the loop) to provide each of its customers with a variety of telecommunications services, including both local and long-distance service. That guarantee cannot be classified as either "intrastate" or "interstate," because the same leased facilities used for local calls will also be used for interstate calls. See Opening Fed. Br. 35-36. For that reason, the rates, terms, and conditions on which new entrants may exercise their new rights will have profound consequences for competition not just in local markets, but also in the long-distance and other interstate markets.[7]

---

[7] The same is true of decisions under Section 251(f) about whether to relieve rural LECs from full compliance with Section 251(c)(3): The question there is also whether, and on what terms, new entrants will be able to use an incumbent's facilities to provide customers with both intrastate and interstate services. Cf. USTA/Rural Carrier Br. 26. California's separate reliance on Section 2(b) to limit the Commission's authority to address Section 251(b)(3)'s dialing parity obligation is unsound for the still more basic reason that Section 2(b)'s distinction is not even the distinction that California invokes Section 2(b) to support. Like the court of appeals (Pet. App. 87a-88a & n.5), California does *not*

In a passage that some respondents ignore (*e.g.*, GTE Br. 47), the Commission found that it would violate congressional intent to try to "separate" the carrier-to-carrier prices for (*e.g.*) network elements into distinct "intrastate" and "interstate" components governed under distinct state and federal regulatory schemes. See Opening Fed. Br. 36-37. Respondents did not propose such a "separations" regime at the time. Indeed, they do not seek it now. They seek instead to deny the Commission *any* role in this regulatory area, even though the area defies classification as either "interstate" or "intrastate." That gets the law exactly backwards. Where it is "not possible" to fulfill congressional intent by "separat[ing] the interstate and the intrastate components" of telephone regulation, jurisdictional conflicts must be resolved in favor of a continued federal role. *Louisiana*, 476 U.S. at 375 n.4.[8]

---

challenge the Commission's authority to address dialing parity as to an enormous class of intrastate calls: those that cross the lines of the more than 160 exchange areas—known as "local access and transport areas" or LATAs—created at the time of the AT&T divestiture. See California Br. 20-21; 47 U.S.C. 251(g). Section 2(b) cannot plausibly be read to divide up authority *between subcategories* of intrastate calls: *i.e.*, between "*intra*LATA" intrastate and "*inter*LATA" intrastate calls.

[8] The Bell Companies argue that our position on this point must be wrong because, they say, it suggests that the Commission always had authority to take regulatory measures ensuring competition in local markets. Bell Atl. Br. 32. In fact, the Commission had begun taking such measures, with judicial approval, in a variety of regulatory settings before 1996, and the Commission had set unitary rates for "private lines" and other facilities with both interstate and intrastate uses. See AT&T Opening Br. 4-9; Opening Fed. Br. 37-38; see also 47 U.S.C. 251(g). As AT&T observes in its opening brief (at 6, 9, 12), Section 253, added by the 1996 Act, answers the principal questions about the scope of that authority. Moreover, by creating new substantive federal standards addressing local competition, Sections 251 and 252 confirm that, when implementing those standards, the Commission acts within its express authority to "prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this Act." 47 U.S.C. 201(b); see pp. 10-11, *supra*. Bell Atlantic makes no attempt to address those points.

But respondents do not stop there. Like the Eighth Circuit in its mandamus order, respondents contend (*e.g.*, State Comm'n Br. 29) that Sections 251 and 252 operate to impair the Commission's jurisdiction over an additional subject that has always been a matter of uniquely federal concern: Bell Company entry into the interstate long-distance market, now governed by Section 271. Section 271 provides that "[t]he Commission shall not approve" a Bell Company's long-distance application "unless *it finds*," among other things, that the Bell Company has provided interconnection, network elements, and resale "in accordance with the requirements"—pricing and otherwise—of Sections 251(c)(2)-(4) and 252(d)(1) and (3). 47 U.S.C. 271(c)(2)(B)(i), (ii), (xiv) and (d)(3) (emphasis added); see Opening Fed. Br. 29.

Respondents would ban the Commission from playing any role in determining what it means to meet those requirements *as a prerequisite to long-distance entry*. *E.g.*, State Comm'n Br. 29. Instead, as respondents acknowledge, they would compel the Commission to abdicate core aspects of that long-distance inquiry to each of the 50 state commissions, with potentially radical state-by-state differences in both methodology and result. *Ibid.*[9] As the

---

[9] The Bell Companies acknowledge the same point but contend that, under their position, the FCC would retain an undefined residual role in determining "whether a Bell company is in *compliance*" with the States' pricing requirements. Bell Atl. Br. 42. That claim is both irrelevant and (in the Bells' own view, expressed elsewhere) untrue. First, the subject of any "compliance" inquiry would of course be compliance *with* the States' disparate methodological choices, to which respondents would bind the Commission, despite Section 271's contrary mandate. (Under the Bells' approach, the Commission would be bound until after the lengthy process of federal court review under Section 252(e)(6) has run its course, at which point the Commission would need to reconsider, and perhaps revoke, any earlier order approving an application based on an invalidated state methodology. See 97-1519 Pet. 22 n.7.) Second, the Bells themselves have elsewhere argued that the logic of the Eighth Circuit's decision—under which each state commission arbitrates all compliance disputes between carriers (Pet. App. 32a-34a)—precludes *any* role for the FCC in addressing pricing

D.C. Circuit has confirmed, that approach flatly contradicts the Commission's statutory obligation, before granting a Bell Company long-distance application, to "conclude[] *to its own satisfaction*" that the applicant has in fact met Section 271's requirements. *SBC Communications Inc.* v. *FCC*, 138 F.3d 410, 416 (1998) (emphasis added). Indeed, respondents' approach to Section 271 exemplifies what they hope to achieve in this litigation, and what the text of the Act forecloses: a dramatic shift in interstate regulatory authority from the federal government to the States.[10]

C. Respondents' Approach Would Impose Immense Burdens On Potential Competitors And The Federal Courts

Respondents' jurisdictional analysis is unsound for one final reason: They cannot keep the federal courts from giving nationally consistent content to the 1996 Act's central guarantees, but they can delay the process of federal interpretation of federal law and, in so doing, impose enormous interim burdens on potential competitors and the federal courts.

Congress is presumed to intend that the meaning of the laws it enacts will be consistent throughout the country. The federal guarantees of Sections 251 and 252 have highly consequential content, which the state commissions are not free to interpret however they please. The job of the federal courts, in reviewing state arbitration decisions

---

issues under Section 271. See 97-1519 Reply Br. in Supp. of Pet. 4-5 n.3 (quoting Bell briefs); see also J.A. 292 (mandamus order) (to perform its "quite simple" role under Section 271, FCC should, *inter alia*, "simply ask[] the state commission whether the applicant BOC has complied with the state commission's pricing rules").

[10] Resolution of the FCC's authority to implement Sections 251 and 252 must accommodate, but cannot change, the plain meaning of Section 271. We have separately challenged the Eighth Circuit's mandamus order because, even if respondents were to prevail here as to Sections 251 and 252, the Eighth Circuit's view of Section 271 would still be invalid and should still be reversed. See 97-1519 Pet. 27-28.

under Section 252(e)(6), is to ensure that those new federal guarantees are consistently observed. The dispute here is not, as respondents seek to portray it (*e.g.*, Bell Atl. Br. 45), whether the federal courts may accommodate the expertise of state commissions in resolving the distinctive factual issues that arise in particular regions and involve particular carriers. They may do that. What the federal courts assuredly may *not* do is to "defer" to 50 potentially inconsistent legal interpretations of the 1996 Act's core substantive guarantees.[11]

For example, Congress provided that the rates charged for access to an incumbent's network elements must be "based on the cost (determined without reference to a rate-of-return or other rate-based proceeding) of providing [such elements]" and "may include a reasonable profit." 47 U.S.C. 252(d)(1). Congress did not intend for 50 state commissions to diverge on such basic federal issues as whether "cost" means forward-looking economic costs or historical costs. The "cost" standard has a determinate content, although the parties of course disagree about what that content is. Indeed, the respondent LECs themselves have urged the federal courts to overturn many state commission determinations that the Act calls for network-element rates to be based on forward-looking rather than historical costs (as the FCC had also determined in its now-vacated rules).

That and many other substantive disagreements about the 1996 Act must ultimately be decided by the federal courts. The question is whether the federal courts will decide the parties' core substantive disagreements on the

---

[11] See, *e.g.*, *AT&T Communications of Cal., Inc.* v. *Pacific Bell*, No. C 97-0080, 1998 WL 246652, at *3 (N.D. Cal. May 11, 1998) (conducting de novo review of state interpretations of 1996 Act because "'[s]tate commissions, while having experience in regulating local exchange carriers in intrastate matters, have little or no experience in implementing federal laws and policies and do not have the nationwide perspective characteristic of a federal agency'") (quoting *U.S. West Communications, Inc.* v. *Hix*, 986 F. Supp. 13, 17 (D. Colo. 1997)).

merits in a single proceeding on direct review of the FCC's rules or, as the respondent LECs would prefer, in piecemeal review proceedings under Section 252(e)(6) stretching well into the next century. The latter approach would inflict anticompetitive uncertainties and severe transaction costs on potential competitors, to the ultimate detriment of consumers. It would also greatly burden the federal courts, which, without applicable Commission rules, would have to interpret many of the 1996 Act's guarantees from scratch. But, sooner or later, the federal courts will give content to this federal law. See Opening Fed. Br. 39-41.

The principal question, then, is whether the incumbent monopolists, which still control 98% of local revenues (see Opening Fed. Br. 41), will succeed in placing logistical obstacles in the way of the "federal deregulatory power needed to complete American telephony's transition from command-and-control regulation to open competition." Jim Chen, *TELRIC In Turmoil, Telecommunications in Transition*, 33 Wake Forest L. Rev. 51, 54 (1998). Congress gave the Commission the rulemaking powers at issue here precisely because it wanted a smooth and expeditious transition to open competition, not a chaotic and dilatory one. And if Congress had left any doubt about the degree of federal regulatory authority necessary to make this federal statute work, the Commission's considered answer would be entitled to substantial deference. See Opening Fed. Br. 41-42.

* * * * *

The Commission's authority to adopt rules addressing the 1996 Act's pricing provisions is by far the most important jurisdictional issue in this case, and that is why the parties have focused on it. Several respondents suggest that, even if the Commission's rulemaking jurisdiction extends to many of the provisions of Section 251, including the rate provisions, it does not extend to certain others: *e.g.*, the "dialing parity" provision of Section 251(b)(3) (see California Br. 40-48) or the "rural exemp-

tions" provision of Section 251(f) (see USTA/Rural Carrier Br. 17-20).

That is incorrect. The same provisions that give the Commission its undisputed authority to implement the nonpricing network-element provisions of Section 251(c)(3) also authorize the Commission to issue general rules addressing, at a minimum, the other provisions of Section 251. See p. 4, *supra*. Moreover, the Eighth Circuit based its disposition of Sections 251(b)(3) and 251(f) on the same general grounds that underlay its primary decision denying the Commission any role in addressing the 1996 Act's pricing provisions.[12] If this Court resolves the pricing issues in the Commission's favor, the Eighth Circuit's rationale for denying the Commission authority to address Sections 251(b)(3) and 251(f) would collapse, and those portions of the decision below should be reversed. Alternatively, if this Court were to have any doubt about the proper disposition of these secondary jurisdictional issues after resolving the parties' principal dispute, it should remand those aspects of the case to the court of appeals for further consideration.[13]

---

[12] Those were, *first*, an unwillingness to recognize Section 251(d)(1) as an explicit declaration of the Commission's obligation to "implement the requirements of this section"; *second*, a belief that the Commission's general regulatory authority under Section 201(b) is confined to exclusively interstate matters, even though that provision imposes no such limitation; *third*, an expansive interpretation of Section 2(b); and *fourth*, a nearly irrebuttable presumption that, wherever the 1996 Act contemplates *some* role for the state commissions, the Commission may play *no* role at all (even though the state commissions and the FCC indisputably play overlapping roles in many areas, such as access to network elements). See Pet. App. 10a-24a, 27a-30a, 34a-36a, 83a-86a. As we have discussed, each of those grounds is invalid. See also note 7, *supra*; Opening Fed. Br. 26 n.9; Opening AT&T Br. 30-31 (discussing 47 U.S.C. 208).

[13] The Rural and Mid-Sized Carriers rely heavily on 47 U.S.C. 261(b), which the Eighth Circuit cited only in passing (Pet. App. 39a), and to which the state commission respondents devote no discussion. Entitled "[e]xisting [s]tate [r]egulations," Section 261(b) preserves state regulations that "fulfill[] the requirements of this part" and are

II. THE COMMISSION'S RULES REASONABLY IMPLEMENT THE 1996 ACT'S GUARANTEE OF NONDISCRIMINATORY ACCESS TO NETWORK ELEMENTS

A. Introduction And Summary Of Argument

The 1996 Act is a comprehensive legislative package that is designed to open all telecommunications markets to competition. In many respects, the Act greatly benefits the incumbent monopolists that challenge the Commission's rules governing access to network elements.[14] For example, the Act "as a whole *relieves* the [Bell Companies] of several of the burdens imposed by [the 1982 AT&T consent decree], particularly by prescribing in § 271 a method whereby the [Bell Companies] can achieve a long-sought-after presence in the long-distance market." *BellSouth*

"not inconsistent with the provisions of this part." The "provisions" with which such regulations must be "consistent" include, of course, any provisions recognizing the Commission's rulemaking role, *e.g.*, 47 U.S.C. 251(d)(1), 252(c)(1); see also 47 U.S.C. 261(c), and respondents' reliance on Section 261(b) is therefore circular. Moreover, the scope of Section 261(b) is confined to state regulations "fulfilling the requirements of this part," and the 1996 Act elsewhere indicates that the scope of its "requirements * * * includ[es] the regulations prescribed by the Commission." 47 U.S.C. 252(c)(1); see also 47 U.S.C. 261(c). For that reason, as well as the others discussed in our opening brief (at 23 & n.7), there is also no merit to the Rural and Mid-Sized Carriers' argument that the anti-field-preemption provision of Section 251(d)(3) somehow limits the legal effect of validly issued Commission rules. And, in part because Section 251(d)(3) "was designed" for "state statutes or regulations that are independent from the Telecommunications Act of 1996," the Eighth Circuit squarely held that, *despite Section 251(d)(3)*, state commissions must "ensure that arbitrated agreements comply with the Commission's regulations" whenever those commissions "are fulfilling their roles as arbitrators of agreements pursuant to the [1996 Act]." Pet. App. 38a-39a; see 47 U.S.C. 252(c)(1). *No* party has challenged that aspect of the Eighth Circuit's holding.

[14] The state commissions do not challenge any of the network-element rules disputed here on the merits, even though they are bound by those rules when arbitrating disputes under Sections 251 and 252. See 47 U.S.C. 252(c)(1); Pet. App. 38a.

Corp. v. *FCC*, No. 97-1113, 1998 WL 242244, at *7 (D.C. Cir. May 15, 1998); see also 1996 Act, Pub. L. No. 104-104, Tit. VI, § 601(a)(2), 110 Stat. 143 (superseding GTE consent decree). And the Act enables all incumbent LECs to offer competitive services in the traditional markets of other incumbents.

The incumbents have little appetite, however, for any interpretation of the local competition provisions that would bring competition to their home markets.[15] Instead, they seek to engraft various limitations onto Section 251(c)(3)'s core guarantee of "nondiscriminatory access to network elements on an unbundled basis at any technically feasible point on rates, terms, and conditions that are just, reasonable, and nondiscriminatory." Through such limitations, they seek to impede the 1996 Act's basic objectives: an infusion of competition into traditional monopoly markets "as quickly as possible," H.R. Rep. No. 204, 104th Cong., 1st Sess. 89 (1995) (House Rep.); and (what is the same) the rapid conversion of those markets, with their webs of hidden and inefficient cross-subsidies, into rational markets in which the price of services reflects the cost of providing them.

The limitations that the incumbents seek, however, do not appear either in Section 251(c)(3) or anywhere else in the 1996 Act. In fact, the incumbents cannot point to any actual *restrictions* that Section 251(c)(3) places on a new entrant's rights of access to network elements; instead, they principally contend that various provisions either

---

[15] See generally *Alarm Bells: Is This Really What Congress Had in Mind with the Telecom Act?*, Wall St. J., May 12, 1998, at A1 ("Two years ago, the federal government enacted a law designed to crack local telephone monopolies and bring consumers the benefits of competition. By sweeping away decades of regulation, Washington thought it was paving the way for a free-for-all among the Baby Bells, long-distance carriers, cable operators and other telecommunications providers. Instead, the urge to merge has overwhelmed the compulsion to compete."); *A Bid Too Far?*, The Economist, May 16, 1998, at 63 ("Like it or not, there is precious little competition in America's $100 billion local telephone market[.]").

enhancing those rights in specific respects or creating *other* rights (such as resale) should be construed, by negative inference, to have imposed implicit limitations on the basic guarantees of Section 251(c)(3). As we discuss below, those textual arguments would be unpersuasive even if this Court were reviewing this statutory scheme *de novo*: Congress wrote Section 251(c)(3) broadly because it recognized that nondiscriminatory access to network elements would be the only effective means of creating robust local competition in the foreseeable future. The incumbents' textual arguments are particularly unsound, moreover, as arguments for overcoming the deference that the Commission is due in effectuating this many-dimensioned statutory scheme. And the incumbents' other textual arguments fare no better. The Commission reasonably implemented Section 251(d)(2), which instructs it to "consider" certain factors when determining "what network elements should be made available"; and it reasonably implemented the 1996 Act's definitional and other provisions in directing incumbents to provide new entrants with nondiscriminatory access to certain specific elements disputed here.

The incumbents thus fall back on a variety of policy contentions. We discuss those contentions in more detail below, but three points warrant mention at the outset. First, the "arbitrage" that the incumbents resist is another name for the rational, cost-based competition that, under *any* interpretation, Section 251(c)(3) is designed to create. Because such competition is both intended and inevitable, the incumbents' essential submission is that this Court should read *permanent*, countertextual limitations into the 1996 Act to accommodate *interim* concerns, properly addressed in a separate proceeding, about the pace of universal-service reform under Section 254. This statute, however, is designed to last well into the next century; the incumbents' approach would lock it firmly in the past.

Second, there is no dispute here about whether the construction of new facilities is often desirable; the question is *who* should decide *what* new facilities it would be *efficient* to construct. The Commission's approach would generally leave those decisions to market forces, which (when rates for access to an incumbent's network elements are set properly) will give new entrants incentives to construct facilities when, and only when, it is efficient to do so. The incumbents' contrary approach would necessitate the very "edict[s] of central planning" (GTE Br. 17) that they profess to dislike, and it would warp the course of competition.

Finally, Congress created resale of an incumbent's existing services as an entry *option*, one among several, and it left the choice of those options to private market actors. Nothing in the 1996 Act requires new entrants to pick the resale option when, by its terms, Section 251(c)(3) also gives them the option of leasing network elements, with its very different mix of advantages and disadvantages. The incumbents' argument for creating such a requirement has no textual foundation; instead, it is derivative of, and no sounder than, their other policy contentions.[16]

B. The Commission Reasonably Rejected The Incumbents' General Proposals For Limiting The Competitive Effects Of Section 251(c)(3)

The incumbents' most ambitious challenges, which they present together (*e.g.*, Bell Atl. Br. 53-63), are the two that the Eighth Circuit viewed as related: related in the sense that either, if accepted, would effectively remove network elements as an entry option for many carriers. See Pet. App. 56a-57a. The first challenge, which the Eighth

---

[16] This brief addresses the major contentions in the numerous briefs (three by the Bell Companies alone) filed on behalf of the cross-petitioners. To the extent that we have not addressed other contentions, that is attributable to the page limitation, not to any substantive agreement with cross-petitioners.

Circuit did accept (*id.* at 69a-72a), concerns Rule 315(b)'s ban on an incumbent's infliction of discriminatory costs on new entrants. The second challenge, which the Eighth Circuit rejected (*id.* at 53a-60a), concerns the Commission's decision not to impose a "facilities ownership" requirement on new entrants invoking Section 251(c)(3).

1. Rule 315(b) Is A Reasonable Implementation Of Section 251(c)(3)

Rule 315(b), 47 C.F.R. 51.315(b), forbids an anticompetitive practice that we describe in our opening brief (at 43-48), and which the incumbents nowhere disavow as their objective: They want to disconnect previously connected elements, over the objection of the requesting carrier, not for any productive reason, but just to impose wasteful reconnection costs on new entrants. Put another way, the incumbents want to drain value out of their facilities to ensure that their competitors either spend money unnecessarily to replace the lost value or stay out of the market altogether. The result: an unnecessary expenditure of resources, no net increase in value, and thwarted prospects for competition.

That anticompetitive exercise in economic waste is so plainly discriminatory that, even in the absence of a Commission rule, it would violate an incumbent's statutory obligation to provide "*nondiscriminatory* access to network elements * * * on rates, terms and conditions that are just, reasonable, and nondiscriminatory." 47 U.S.C. 251(c)(3) (emphasis added). But because the Commission *has* interpreted Section 251(c)(3) to forbid this practice, see Opening Fed. Br. 43-46; note 17, *infra*, the incumbents must show that the statute somehow forecloses that interpretation. See *Chevron U.S.A. Inc.* v. *Natural Resources Defense Council, Inc.*, 467 U.S. 837, 842-843 (1984). They cannot.

The incumbents rely principally on the second sentence of Section 251(c)(3), which supplements the nondiscrimination rights of the first sentence, and further bars incumbent LECs from frustrating a new entrant's right "to

combine [requested] elements" where (for example) the elements were not previously combined as the new entrant wishes to combine them or where the new entrant wishes to combine them with its own elements. The incumbents argue that "it cannot be * * * 'discriminatory' for an incumbent to do just what section 251(c)(3) expressly requires of it—provide network elements in a manner that allows a new entrant to combine them" Bell Atl. Br. 56. That is illogical. The inclusion of specific obligations in the second sentence of Section 251(c)(3) does not give incumbent LECs a free pass through the nondiscrimination mandate of the first sentence. An incumbent's duty to "allow" new entrants to combine elements that they wish to combine does not somehow entitle the incumbent to disconnect elements, against the new entrants' wishes, simply to impose anticompetitive costs on them.[17]

The incumbents also claim that imposing such costs cannot be discriminatory because, after all, "it was the incumbent that did the work and spent the money to design a network and combine the individual elements that comprise it." U.S. West Br. 52. The argument reduces to this: "because we are the regulated monopolists who put value into this network, we have the right to take much of that value away, and force new entrants to waste money in putting it back, before we let them share in our economies of scale." Few propositions could be more antithetical to the 1996 Act. To create local competition, Congress wished to preserve, not waste, the accumulated value of existing facilities. See Pet. App. 137a (¶ 11). And, al-

---

[17] As the Commission explained, the discriminatory and wasteful character of the conduct prohibited in Rule 315(b) justifies that rule quite apart from a separate issue on which we have not sought this Court's review: whether an incumbent must itself *combine* previously *uncombined* elements before making them available to new entrants. *Third Order on Reconsideration*, FCC No. 97-295, ¶ 44 (Aug. 18, 1997) (J.A. 247-248), petitions for review pending *sub nom. Southwestern Bell Tel. Co.* v. *FCC*, Nos. 97-3389, *et al.* (8th Cir., argued Jan. 15, 1998); see generally Pet. App. 230a-231a (¶¶ 289-293).

though the incumbents wrongly suggest otherwise (*e.g.*, Bell Atl. Br. 56), a new entrant must of course compensate incumbents for access to precombined elements at cost-based rates: rates that take the costs of combination into account and "may include a reasonable profit" for the incumbent. 47 U.S.C. 252(d)(1)(B).

The incumbents also renew their argument (*e.g.*, Bell Atl. Br. 53-55) that the term "unbundled" means "disconnected" and that compliance with Section 251(c)(3) thus entitles them to disconnect requested elements whenever they wish, no matter what the anticompetitive harm. As we observe in our opening brief (at 44-45), however, the prevailing definition of "unbundled" during the 15 years leading up to the 1996 Act was "offered at separate prices"; indeed, in some contexts, it would have been nonsensical for "unbundled" to have meant "disconnected." See Opening MCI Br. 19-20.[18] Here, recognizing that many new entrants would enter local markets incrementally, Congress entitled those entrants to elements on an "unbundled" basis to ensure that an incumbent would not charge them for more elements than they want. But, by protecting new

---

[18] As noted in our opening brief (at 45), the incumbents' approach to "unbundled elements" ignores the technical reality of the telephone network, including, in particular, the signaling system. The incumbents respond only that "the FCC's rules consider signaling and switching to be part of the *same* element" when new entrants seek access to both. Bell Atl. Br. 57. That is incorrect. The Commission's rules define switching (47 C.F.R. 51.319(c)) and signaling (47 C.F.R. 51.319(e)) as separate elements, and that separate definition of the signaling system element continues to apply "[w]hen a requesting telecommunications carrier purchases unbundled switching capability from an incumbent LEC." 47 C.F.R. 51.319(e)(1)(ii). The incumbents (*e.g.*, Bell Atl. Br. 54) separately argue that, in paragraph 44 of the Third Order on Reconsideration (J.A. 247-248), the Commission departed from its preferred usage and employed the term "unbundled" to mean "physically severable." The passage in question, however, addressed the precedential effect of the Eighth Circuit's initial opinion in this case. It is of course that Eighth Circuit opinion (along with the subsequent order invalidating Rule 315(b)) whose misapplication of the term is at issue here.

entrants in that respect, Congress did not entitle incumbents to make the elements that new entrants *do* want less valuable than they are when the incumbents use them. Indeed, the incumbents cannot point to any context in which the term "unbundled" has been used that way: to compel someone, against that person's will, to accept requested items on a disconnected basis. In the end, even the incumbents recede from that construction and appeal to "context." *E.g.*, Bell Atl. Br. 54. But, as discussed, "context" defeats them; and, even if it did not, it surely accommodates the Commission's construction of Section 251(c)(3)'s nondiscrimination mandate.

One final point: The incumbents' textual arguments (*e.g.*, Bell Atl. Br. 53-56) for invalidating Rule 315(b) are detached from, and much broader than, their general policy arguments for limiting the competitive effects of Section 251(c)(3). Whereas their policy arguments purport to favor facilities-based competitors (*e.g.*, *id.* at 64), their textual arguments for challenging Rule 315(b) would disadvantage *all* new entrants alike. If Section 251(c)(3) meant what they say, incumbents could disconnect any two previously combined network elements whenever they wished to disadvantage the requesting carrier—whether or not the requested elements could by themselves be used to provide finished services, and whether or not the requesting carrier had facilities of its own. The incumbents' construction of this statute would thus undermine all element-based competition equally, with no conceivable public benefit.[19]

---

[19] Respondent Association for Local Telecommunications Services (ALTS), which represents niche-market carriers with some local facilities of their own, seeks to defend *both* the Eighth Circuit's judgment concerning Rule 315(b) *and* the Commission's authority to "requir[e] the incumbents to provide any and all existing combinations that are *not* similar to resold services." ALTS Opposing Br. 14. ALTS can accomplish that feat only by rejecting the incumbent LECs' textual position and by arguing instead that, "to save the statutory structure" (*id.* at 18), Section 251(c)(3) should be construed not to give new entrants efficient access to all elements needed to provide services

2. The Commission Reasonably Interpreted Section 251(c)(3) Not To Include An Implicit "Facilities Ownership" Requirement

The incumbents next challenge the Commission's decision *not* to issue rules imposing a "facilities ownership" limitation on Section 251(c)(3). In their view, a new entrant should be able to obtain elements under that provision only if it already has "at least some network facilities of its own." Bell Atl. Br. 57. The argument has no textual or policy basis.

a. As the Commission found (Pet. App. 242a (¶ 328)), and as the Eighth Circuit reaffirmed (*id.* at 55a), neither Section 251(c)(3) nor any other provision of the 1996 Act requires a new entrant to build its own facilities before obtaining access to the elements of an incumbent's network. To the contrary, Section 251(c)(3) compels incumbents to provide access "to *any* requesting telecommunications carrier for the provision of a telecommunications service" (emphasis added), which the Act elsewhere defines as "the offering of telecommunications for a fee directly to the public * * * *regardless* of the facilities used," 47 U.S.C. 153(46) (emphasis added). In marked contrast, the immediately preceding subsection, Section 251(c)(2), obligates incumbents to "interconnect" with "the facilities and equipment" of other carriers, language that does not appear in Section 251(c)(3).

An incumbent's simple obligation to provide access "to any requesting * * * carrier" disposes of this issue. But the incumbents' textual problems do not stop there. The incumbents contend that new entrants must have "at least some" facilities of their own (Bell Atl. Br. 57) before invoking Section 251(c)(3). What does "some" mean? As the Commission observed, the incumbents presumably seek a rule that is not "so easy to meet it would ultimately be

---

independently available under Section 251(c)(4). But that argument, which we separately address below (at pp. 36-41), is unhinged from any textual basis for challenging Rule 315(b) itself.

meaningless." Pet. App. 248a (¶ 339). A meaningful rule would require extensive federal regulations governing the number and kinds of facilities that a new entrant must own before invoking rights under Section 251(c)(3). Apart from the dubious policy merits of distorting the market with such regulations, see p. 34, *infra*, Congress's failure even to suggest statutory standards for such regulations confirms what the statutory text already makes clear: that Congress did not intend to limit Section 251(c)(3) so as to necessitate such regulations in the first place.

b. With no textual basis for their proposed rule, the incumbents turn to a phrase that *protects* new entrants' rights in particular respects and mischaracterize that phrase as an implicit *restriction* of new entrants' rights in more general respects. They argue that, because Section 251(c)(3) entitles new entrants to gain access to an incumbent's elements "at any technically feasible point," Congress must have "contemplate[d] a physical interconnection of networks" (Bell Atl. Br. 57); and because Congress "contemplate[d]" that particular circumstance, Congress must also have intended to *limit* Section 251(c)(3) to that circumstance, and thus to carriers that wish "to make a physical connection" (*id.* at 58) with the incumbent.

That argument is unsound and, in any event, irrelevant. It is unsound because, as the Commission observed, the guarantee of network access "at any technically feasible point" addresses the points of the network at which new entrants *may* obtain access to elements; it does not *require* new entrants to connect their own facilities to the incumbent's elements at those points. See Pet. App. 242a-243a (¶ 329) ("If we were to conclude otherwise, then new entrants would be prohibited from requesting two network elements that are connected to each other because the new

entrant would be required to connect a single network element to a facility of its own.").[20]

And the argument could not help the incumbents in any event. To manipulate particular facilities used in providing service under Section 251(c)(3), a new entrant must typically establish a "physical connection" (Bell Atl. Br. 58) between its own operational support systems (OSS) and the OSS of the incumbent LEC. See *In re Application of Ameritech Mich. Pursuant to Section 271*, FCC No. 97-298, ¶¶ 134-143 (Aug. 19, 1997) (*Ameritech Michigan Order*) (lodged with this Court in No. 97-1519); see also J.A. 118 (¶ 518). That is so whether or not OSS is itself considered a "network element." See pp. 46-47, *infra*. For that reason, if Congress had meant to base a "facilities ownership" requirement on a phrase *protecting* a new entrant's rights (a dubious proposition by itself), it could not have chosen more inapt language than the phrase it used here, which guarantees access "at *any* technically feasible point." Congress's choice of language was not inapt, however, because Congress made Section 251(c)(3) applicable to "any requesting * * * carrier" and did not intend to impose any "facilities ownership" requirement at all.

---

[20] There is similarly no merit to the incumbents' efforts (*e.g.*, Bell Atl. Br. 58-59) to infer a "facilities ownership" requirement from Section 251(c)(6), which gives new entrants a right to "physical collocation" with an incumbent's facilities. Again on the false premise that whenever Congress creates one competitive option it implicitly withdraws another, the incumbents argue that "Congress would have had no need to require physical collocation for this purpose if, as the FCC asserts, entrants would never actually be required to enter onto the incumbent's premises to connect equipment." *Ibid.* That does not follow. The fact that Section 251(c)(6) specifically entitles a new entrant to physical collocation if that is what it seeks does not mean that Section 251(c)(3) compels every new entrant to construct facilities of its own before gaining access to network elements.

3. The Incumbents' Policy Arguments Lack Merit

In sum, the text of the 1996 Act itself forecloses the incumbents' principal efforts to limit Section 251(c)(3), and even if it did not, the Commission's resolution of any ambiguities would be at least reasonable. See *Chevron*, 467 U.S. at 842-843. The incumbents nonetheless challenge the Commission's decision on several discrete policy grounds. Each is invalid.

a. *Universal service.* Under the traditional system of hidden cross-subsidies for universal service, many customers have paid above-cost telephone rates so that other customers may pay what the incumbent LECs have long characterized as below-cost rates. (The extent to which the above-cost rates truly fund universal service, rather than pad monopoly profits, has always been a subject of debate.) The incumbents contend that, because the price of access to network elements is based on cost, such access would allow new entrants to undersell incumbents in providing service to end users who pay the above-cost prices that currently subsidize universal service.

Here it is crucial to focus on what the incumbents do and do not argue. They do not deny that, under *any* interpretation of Section 251(c)(3), the availability of elements at cost-based rates will ultimately have the effect, which Congress very much intended, of driving prices to cost by permitting new entrants to attract customers who would otherwise pay supracompetitive prices. That market-oriented, efficiency-inducing process is what the incumbents call "arbitrage" and "gamesmanship." *E.g.*, Bell Atl. Br. 50. Congress called it "competition."

Congress also recognized, no less than the incumbents, that driving prices to cost will require replacement of the traditional universal service regime. Congress chose a solution that accommodates, rather than distorts, rational and cost-based competition in local markets. In a provision that the incumbents rarely discuss, Congress called for the creation of a new universal service regime funded not

by covertly above-cost rates exacted from urban and business customers, but by explicit and competitively neutral contributions from "*[a]ll* providers of telecommunications services," *including* new entrants that provide service under Section 251(c)(3). 47 U.S.C. 254(b)(4) (emphasis added). In a May 1997 order, the Commission, following the general recommendations of a Federal-State Joint Board, see 47 U.S.C. 254(a), began implementing the transition to the new regime.[21]

Because the incumbents cannot indefinitely keep competition from driving prices to cost, their complaint, at bottom, is about the details of the transition from the old telecommunications world into the new. In particular, they ask this Court to find some way to impede the competitive effects of Section 251(c)(3) to accommodate what they contend will be a "potentially lengthy period" (Bell Atl. Br. 50) of universal service reform. That argument is unsound on two levels.

First, it is misdirected. As the Commission found, the proper way to reconcile universal service concerns with the emergence of robust local competition is not to erect arbitrary new barriers to competition, as the incumbents would like, but to ensure timely implementation of the universal service reforms ordered in Section 254. See Pet. App. 132a-136a (¶¶ 3-9). In whatever respects the incumbents dispute the implementation plan designed by the Commission and the Federal-State Joint Board, they should pursue those disputes in their Fifth Circuit challenge to that plan. See *Texas Office of Pub. Util. Counsel*,

---

[21] See *In re Federal-State Joint Board on Universal Serv.*, 12 FCC Rcd. 8776 (May 8, 1997) (*Univ. Serv. Order*), petitions for review pending *sub nom. Texas Office of Pub. Util. Counsel* v. *FCC*, Nos. 97-60421 *et al.* (5th Cir. filed June 25, 1997). The Commission contemporaneously indicated that competition was not developing in a way that would require instantaneous reforms. See *In re Access Charge Reform*, 12 FCC Rcd. 10,175, 10,184 (June 18, 1997), petitions for review pending *sub nom. Southwestern Bell Tel. Co.* v. *FCC*, Nos. 97-2618, *et al.* (8th Cir., argued Jan. 15, 1998).

supra. But those disputes are no basis for thwarting the local competition guarantees. Congress intended to move both competition and universal service into a dynamic and rational future; the incumbents' essential proposal is to stop the clock on competition because, they suggest, Congress enacted Section 254 largely in vain.[22]

That suggests the second problem with their argument. To address *interim* concerns about the timing of universal service reform, the incumbents would read *permanent* limitations into the guarantees of Section 251(c)(3). But Congress wrote those guarantees to last well into the next century, long after the process of reforming universal service has run its course, and long after any conceivable objection to widespread cost-based competition has vanished. Congress enacted Section 254 precisely to ensure that universal service concerns would not warp the process of bringing competition to local markets. By assuming away the efficacy of Section 254, however, the incumbents would permanently impair competition to accommodate a hidden-subsidy system that the 1996 Act itself has made obsolescent.

---

[22] Some incumbents suggest (*e.g.*, Bell Atl. Br. 49-50; U.S. West. Br. 47) that Section 254 may be ineffectual in reforming intrastate universal service subsidies. Congress thought otherwise. Section 254(f) provides that, under state regulatory direction "not inconsistent with the Commission's rules," "[e]very telecommunications carrier that provides intrastate telecommunications services shall contribute, on an equitable and nondiscriminatory basis," to universal service funding mechanisms. See also 47 U.S.C. 253(b). The Commission adds:

> [A]s competition develops, the marketplace itself will identify intrastate implicit universal service support, and * * * states will be compelled by those marketplace forces to move that support to explicit, sustainable mechanisms consistent with section 254(f). As states do so, we will be able to assess whether additional *federal* universal service support is necessary to ensure that quality services remain "available at just, reasonable, and affordable rates."

Univ. Serv. Order, 12 FCC Rcd. at 8785-8786 (emphasis added) (quoting 47 U.S.C. 254(b)(1)).

In the end, the incumbents' real quarrel is with Congress's carefully considered decision to reform universal service *and* promote robust local competition "as quickly as possible." House Rep. 89; compare 47 U.S.C. 251(d)(1) with 47 U.S.C. 254(a)(2). But this is no place to second-guess that decision. And, with their 98% market shares holding fast more than two years after the Act's passage (see Opening Fed. Br. 41), the incumbents are particularly ill-positioned to do any second-guessing.

b. *Facilities-based competition.* The incumbents also propose to engraft atextual limitations onto Section 251(c)(3) to give new entrants greater incentives to build new facilities. *E.g.*, Bell Atl. Br. 63-64. That argument is also unsound. The issue here is not, as the incumbents portray it, *whether* the construction of new facilities is desirable. The issue, instead, is *who* should decide *which* facilities it would be *efficient* to build, and *when*. As a general matter, the Commission's approach would leave those decisions to market forces, which best reflect what is efficient. The incumbents would assign those decisions to government regulators and, specifically, to the Commission. The Commission reasonably declined the invitation.

Congress recognized, and the incumbents do not deny, that it would make little social or economic sense to try to induce new entrants to duplicate *all* of the telecommunications facilities they might need to provide service, including, for example, the multitude of wires, buried cables, switches, and transport trunks that are part of the existing infrastructure. Absent radical technological change, *some* of those facilities will indefinitely embody such immense economies that the social costs of duplicating them would far outweigh the benefits: important resources would be spent, and streets would be dug up, with no commensurate increase in the value or diversity of telecommunications services. In other circumstances, however, the benefits of building new facilities would outweigh the costs: where, for example, new facilities would

enable a new entrant to offer more, better, or less costly services.

The question is how to distinguish between efficient and inefficient construction of new facilities and who should draw the distinction. The Commission rejected the incumbents' proposal for a government-imposed "facilities ownership" limitation on Section 251(c)(3) because "it would not be possible to identify the elements carriers must own [to make such a limitation meaningful] without creating incentives to build inefficient network architectures that respond not to marketplace factors, but to regulation"; that result, the Commission observed, would frustrate "the 1996 Act's goals of promoting competition." Pet. App. 248a (¶ 339). The incumbents do not answer that concern. Instead, they simply argue that the absence of a facilities-ownership rule would impose *greater* harms because, they say, it would "undermine" any incentive for new entrants to build their own facilities. *E.g.*, Bell Atl. Br. 64.

That is simply incorrect. New entrants invoking rights under Section 251(c)(3) may obtain access to an incumbent's facilities only at cost-based rates that "may include a reasonable profit" for the incumbent. 47 U.S.C. 252(d)(1)(B). If those rates are set at the proper levels (see pp. 35-36, *infra*), new entrants will rationally choose to construct facilities of their own whenever that is the efficient choice: for example, where customer demand exceeds the capacity of existing facilities, or where the new entrant needs new facilities to offer different or more efficient services. See, *e.g.*, J.A. 132-133, 140, 172 (¶¶ 620, 685, 743); see also G. Stigler, *The Theory of Price* (4th ed. 1987). Those incentives are as applicable to new entrants that start out with no local facilities of their own—those who initially seek access to the "platform"—as to new entrants that have already constructed some facilities. Moreover, the incentive to build new facilities will often be enhanced because new entrants will wish to reduce the burdens of negotiating with, and relying on, their chief

competitors—the incumbent LECs—in order to do business. See, *e.g.*, D. Carlton & J. Perloff, *Modern Industrial Organization* 501 (2d ed. 1994).

Ultimately, it is the incumbents' approach, not the Commission's rules, that would suppress efficient facilities development, because their approach would deter many potential competitors from entering local markets at all. See pp. 40-41, *infra*. Moreover, the incumbents' calls for more regulation would force new entrants that *do* enter local markets to construct new facilities inefficiently. Whether through a "facilities ownership" requirement or through an "essential facilities" theory that the statutory language rejects, see p. 43, *infra*, the incumbents would have the government tell private market actors to build new facilities even where they would rather pay a hostile incumbent for the use of its facilities at cost-based rates that "may include a reasonable profit." The Commission reasonably determined that private actors are in a better position to know when such construction makes economic sense. See, *e.g.*, J.A. 63-64, 132-133 (¶¶ 339-340, 620); see also J.A. 54-55 (¶ 287).[23]

Of course, those private actors will have the correct incentives to construct efficient (and not inefficient) facilities only if the prices for access to an incumbent's facilities are set at levels that promote such construction. The Commission's vacated pricing rules do call for prices set at those levels. See, *e.g.*, J.A. 140 (¶ 685). And many state commissions have voluntarily followed the Commission's approach, as the incumbents pointed out in opposing certiorari. *E.g.*, 97-826 Regional Bell Br. in Opp. 19-20; 97-826 GTE Br. in Opp. 24. The incumbents say little about the obvious interrelationship between pricing and nonpricing rules in this context. That reticence is revealing. At bottom, the incumbents' mistaken suggestion that the Commission's nonpricing rules will "undermine" new

---

[23] As discussed above (p. 26), the incumbents' challenge to Rule 315(b) is not even arguably calculated to induce facilities-based competition; it is designed to suppress competition generally.

facilities construction (Bell Atl. Br. 64) can amount to nothing more than a prediction that prices for network elements will be set too low and that new entrants will thus have the wrong incentives.[24] See J.A. 131 (¶ 618) ("The price levels set by state commissions will determine whether the 1996 Act is implemented in a manner that is *pro-competitor* * * * or, as we believe Congress intended, *pro-competition*."). Their argument here is therefore misdirected: their real quarrel is with particular pricing policies, not with the Commission's underlying refusal to inject itself unnecessarily into the determination of which new facilities are efficiently constructed.

Finally, under *any* approach to this statute, there must of course be close coordination between the pricing and nonpricing determinations needed to give effect to Section 251(c)(3). The need for such coordination illustrates why, as discussed in Point I above, it is illogical to suppose that Congress gave the Commission *no* methodological role in addressing the pricing issues that are inextricably bound up in the nonpricing issues that, as all insist, the Commission does have authority to decide. See p. 4, *supra*; see also *American Tel. & Tel. Co.* v. *Central Office Tel., Inc.*, 118 S. Ct. 1956, 1963 (1998) ("Rates * * * do not exist in isolation.").

c. *The distinction between resale and network elements.* The incumbents propose one final justification both for restricting Section 251(c)(3)'s guarantees to new entrants with "facilities of [their] own" and for compelling all new entrants to perform the "additional work" of recombining elements that an incumbent has disconnected solely to burden competition. Bell Atl. Br. 47. They argue

---

[24] That concern is the flip side of a wish: some incumbents (see GTE Br. 41) seek to inflate network element rates to cover universal service costs and to recover the historical costs of their investments, even though the 1996 Act provides that those rates shall be based on "the *cost* (determined *without* reference to a rate-of-return or other rate-based proceeding) of providing the * * * network element." 47 U.S.C. 252(d)(1)(A)(i) (emphasis added).

that reading such limitations into Section 251(c)(3) is required to avoid "utterly obliterat[ing] the statutory distinction between resale and the use of unbundled elements." *Ibid.* That is incorrect for several independent reasons.

i. Section 251 contains several entry options designed collectively to infuse local markets with competition. Congress included several options because it did not know exactly how competition would develop, and it left those decisions to private market actors. It enacted Section 251(c)(4) because it knew that resale would be particularly important in the very near term and that, even thereafter, new entrants would still prefer resale over network elements in certain contexts. See pp. 38-40, *infra*. It enacted Section 251(c)(3) because it recognized that, unlike resale, access to network elements is the only option that can promote full entry into, and dynamic competition in, local telephone markets. *Ibid.* But nothing in Section 251 compels new entrants to pick one entry option over another when either, by its terms, is available. Nor should the Commission, much less the federal courts, create artificial limitations on one option to encourage greater use of another.

What the incumbents seek, though, is a rule confining new entrants to one option (resale) when the statutory text makes another option (network elements) available as well. Unable to find any textual hook for that rule, the incumbents argue that such a rule must be created to avoid "inconsisten[cy] with the scheme" of the 1996 Act. Bell Atl. Br. 61. But the incumbents cannot be speaking about any inconsistency between the Commission's approach and *the text of the Act*. It is natural and common for Congress to create a set of options for private actors and to leave the choice of those options to the private actors, as it has done here. And even the incumbents concede that the Commission's approach will preserve resale as an attractive entry option in many circumstances. Bell Atl. Br. 62-63; see also pp. 38-40, *infra*.

Instead, when the incumbents speak of "inconsisten[cy] with the scheme," they mean that the Commission's approach is inconsistent *with their policy concerns*, which they wrongly attribute to Congress. They claim, in particular, that the Commission's approach is inconsistent with the obsolescent system of universal service cross-subsidies that Section 254 seeks to abolish, and with their own invalid theories about the degree of regulatory intervention needed to spur facilities construction. *E.g.*, Bell Atl. Br. 16. Just as those policy concerns are unsound for the reasons found by the Commission and set forth above, so too is the incumbents' wholly derivative rationale for dictating a new entrant's choice between two equally available statutory options.

ii. Moreover, the incumbents' argument is independently invalid because it rests on a false factual premise. They assert that, under the Commission's plain-language approach, new entrants providing service under Section 251(c)(3) without first building local facilities of their own —those seeking access to the "platform"—would obtain "the exact equivalent of resale" (Bell Atl. Br. 60), "the same thing using different words" (*id.* at 52). That is incorrect, as the Commission has found.

Section 251(c)(4) restricts a new entrant to repackaging the incumbent's *existing retail* services under its own brand name. By contrast, a new entrant that invokes Section 251(c)(3) does not "resell" anything: it leases an incumbent's underlying elements. With those elements, it can provide retail services that the LEC does *not* provide its customers (see Pet. App. 244a-245a (¶ 333) (discussing Centrex)), and, just as important, it can provide crucial *non*-retail services that are necessarily unavailable under Section 251(c)(4). For example, one responsibility that new entrants would typically assume when providing service through Section 251(c)(3), but *cannot* assume when they resell retail services under Section 251(c)(4), is "exchange access": the task of originating and terminating telephone traffic between their customers and the

various long-distance networks. See Pet. App. 245a (¶ 333); see also J.A. 65-71 (¶¶ 356-365). For those reasons, only Section 251(c)(3), and not Section 251(c)(4), enables new entrants to make full, flexible, and truly competitive entry into local markets.

With that greater flexibility come greater risks and operational costs. Because a reseller pays an incumbent only for the retail services it actually resells, the wholesale rates applicable to resale guarantee a predictable margin between the new entrant's resale revenues and what it owes the incumbent for the resold services (although the new entrant's additional costs may deny it any actual profit). See 47 U.S.C. 251(c)(4), 252(d)(3). In contrast, the profitability of using *cost*-based network elements to compete against incumbents depends on several variables, including whether, after agreeing to serve particular customers, the new entrant can recover enough revenues from particular services (including exchange access) to recover its flat-rated charges for loops and all other network elements needed to provide service. See Pet. App. 245a-246a (¶ 334).[25]

The elements option also poses greater operational burdens: unlike resale, with its relatively simple back-office requirements, the elements approach requires new en-

---

[25] Indeed, the loop cost *alone*, which is charged at a flat rate, commonly exceeds the wholesale price of residential telephone service in both urban and non-urban areas. The flat-rated cost of that and other elements needed for service illustrates one reason why, as the Commission has determined, access to network elements poses greater risks for new entrants than resale whether or not "shared transport" is a network element, a discrete issue now pending in the Eighth Circuit. See *Third Order on Reconsideration*, ¶ 47 (J.A. 248-249); cf. Bell Atl. Br. 62. More generally, the incumbents mischaracterize the cost differences between network elements and resale. *E.g.*, Bell Atl. Br. 52 (discussing "discount"). When access to network elements is more profitable to a new entrant than resale, that is often largely attributable not to the difference in what the new entrant pays the incumbent, but to a new entrant's additional *receipt* of (for example) fees for exchange access, a service that new entrants can provide only under Section 251(c)(3).

trants to deploy additional systems to keep track of element-specific usage data and to bill interexchange carriers for originating and terminating exchange access. The reduced risks and transaction costs of resale thus permit more immediate and more narrowly focused entry into telecommunications markets, which is why resale is a particularly important entry option in the very near term.[26] For those reasons, as the Commission found, it is unnecessary to carve exceptions out of the plain language of Section 251(c)(3) to preserve "distinctions" between these two very different entry options. See Pet. App. 243a-246a (¶¶ 331-334); *Third Order on Reconsideration* ¶ 47 (J.A. 248-249).[27]

iii. The incumbents' arguments about "gaming the regulatory system" (Bell Atl. Br. 63) through access to the "platform" are illogical for one final, independent reason. The incumbents simply assume that, once a new entrant gains such access, it will not thereafter build local

---

[26] The relative ease of, and absence of risk in, using resale for immediate entry into local markets is also one reason why the 1996 Act briefly restricts the ability of certain long-distance carriers to market long-distance services jointly with resold local services in some areas, a restriction that will terminate at the latest in February 1999. 47 U.S.C. 271(e)(2); see Pet. App. 246a-247a (¶¶ 336-337). At the same time, Congress expected that local competition resulting from a proper construction of Section 251(c)(3) would help satisfy an important condition (as resale alone could not) for Bell Company entry into the long-distance market. See 47 U.S.C. 271(c)(1); *Ameritech Michigan Order*, ¶¶ 92-101. Such entry would itself terminate the joint-marketing restriction if it occurred before the February 1999 sunset. 47 U.S.C. 271(e)(2).

[27] As the incumbents acknowledge (Bell Atl. Br. 62-63), the different pricing regimes for these two entry options ensure that resale will be a more attractive entry option than network elements for new entrants seeking to recruit customers who (according to the incumbents) are currently served below cost, based on hidden subsidies that are available only to the incumbent. The Act squarely authorizes such resale, which places the incumbents at no competitive disadvantage, no matter what the mechanics of the incumbent's universal service subsidies. See, *e.g.*, *Univ. Serv. Order*, 12 FCC Rcd. at 8866.

facilities of its own: facilities that would satisfy the incumbents' proposed "facilities ownership" rule and would entitle the new entrant, *under the incumbents' own analysis*, to exercise rights under *either* Section 251(c)(3) *or* Section 251(c)(4). But, under a proper pricing regime, all new entrants, including those with access to the platform, will have powerful incentives to develop their own facilities whenever that would contribute to efficiency and consumer welfare. See pp. 34-36, *supra*. And, unlike a reseller, a new entrant that leases elements becomes directly familiar with those elements' costs and usage patterns and can judge when it would be efficient to build new elements. What the incumbents seek, then, is a rule that nips in the bud the very facilities-based competition that would moot their policy arguments: a rule that discourages the initial entry, and the development of a customer base, that would make subsequent facilities investments attractive.

C. The Commission Reasonably Applied The Statutory Definition Of "Network Element" And Reasonably Determined Which Elements Must Be Made Available

Moving from the general to the more specific, the incumbents challenge the Commission's determinations of the "elements that incumbents must provide." Bell Atl. Br. 65. There are two discrete subjects of that challenge (see *id.* at 65-72): the Commission's application of the "necessary" and "impair" standards of Section 251(d)(2), and its specific determinations that Section 251(c)(3) entitles new entrants to gain access to an incumbent's "operational support systems," "vertical switching features," and operator services.

1. The Commission Reasonably Applied Section 251(d)(2)

Section 251(d)(2) instructs the Commission, when "determining what network elements should be made available," to "consider, at a minimum," whether access to *proprietary* elements is "necessary," and whether failure to

provide access to *other* elements "would impair the ability of the * * * carrier seeking access to provide the services that it seeks to offer." The Commission defined "necessary" to mean "that an element is a prerequisite for competition," J.A. 50 (¶ 282), and it defined "impair" to mean " 'to make or cause to become worse; diminish in value,' " J.A. 53 (¶ 285) (quoting *Random House College Dictionary* 665 (rev. ed. 1984)). The Commission further observed that Section 251(d)(2) sets forth "minimum *considerations* that the Commission shall take into account," but that it does not require the Commission, after considering those factors along with various others, to assign them dispositive weight. J.A. 54 (¶ 286) (emphasis added). The Commission explained that, in the same order, it had expressly taken these considerations into account when formulating its limited initial set of network elements that must be unbundled. J.A. 48-49 (¶ 277).[28] It added that the state commissions should also follow those considerations "to the extent [those commissions] impose additional unbundling requirements." *Ibid.* The Eighth Circuit upheld the Commission's approach. See Pet. App. 47a-50a.

The nature of the incumbents' challenge here is difficult to discern. If they are contending that Section 251(d)(2) itself should have compelled a different outcome in the Commission's initial categorization of "what network elements" must be made available, they do not clearly say so or even specify the "elements" that (in their view) Section 251(d)(2) somehow removes from the scope of a new entrant's access rights. If they are contending that Section 251(d)(2) requires a further case-by-case inquiry into a *particular* new entrant's need for a *particular*

---

[28] See, *e.g.*, First Report and Order ¶¶ 388-389 (loops), 393 (network interface device), 410-411, 419-420 (switching), 425 (tandem switching), 482 (signaling), 491, 497 (call-related databases), 521-522 (OSS), 539-540 (operator and directory assistance systems); compare *id.* at ¶ 414 (determining that additional unbundling of switching element to create independent vertical feature elements is *not* "necessary to promote local competition").

facility or functionality that falls within one of the Commission's categories, their frequent use of the passive voice—"*some* inquiry into actual market conditions should be made" (Bell Atl. Br. 66)—leaves unanswered *who* would be conducting that inquiry. The incumbents would presumably foist most of that proposed chore on the state commissions in individual arbitration proceedings, even though Section 251(d)(2) does not, by its terms, even speak to their role.

The incumbents theorize that Section 251(d)(2) somehow confines a new entrant's access rights to an incumbent's "essential facilities." But the antitrust term "essential facilities" does not appear anywhere in this statute. Instead, Congress chose other words with quite different meanings. As to most network elements, what the Commission must "consider" is *not* whether the element is "essential," but whether deprivation of the element "would impair the ability" of a requesting carrier "to provide the services that it seeks to offer." 47 U.S.C. 251(d)(2)(B). The Commission reasonably determined that a new entrant's ability to offer service is "impaired" ("diminished in value") if "the quality of the service the entrant can offer, absent access to the requested element, declines" or if "the cost of providing the service rises." J.A. 53 (¶ 285). That is the plain meaning of the term. And, as to "proprietary" elements, Congress directed the Commission to "consider" whether access to the element is "necessary," a term that, as the Eighth Circuit observed, this Court itself has broadly defined to mean "convenient, or useful," rather than "essential." Pet. App. 48a (quoting *M'Culloch* v. *Maryland*, 17 U.S. (4 Wheat.) 316, 413 (1819)); accord *Armour & Co.* v. *Wantock*, 323 U.S. 126, 129-130 (1944) (rejecting claim that "necessary" means "essential").

Moreover, Section 251(d)(2) does not even direct the Commission (as the incumbents suggest) to give the "necessary" and "impair" standards dispositive weight. See J.A. 54 (¶ 286). Instead, it directs the Commission to

"consider" those factors, "at a minimum," "[i]n determining what network elements should be made available." And that is what the Commission did. It considered those factors together with the competitive goals of the 1996 Act; it then created an initial categorization of network elements that must be unbundled; and it further concluded that, in most (but not all) circumstances,[29] new entrants may decide, without case-by-case regulatory second-guessing, when the use of existing elements would avoid costly inefficiencies in providing service. See J.A. 50-55 (¶¶ 282-288); p. 42 and note 28, *supra*. No more was required. When a "statute by its terms merely requires the Commission to consider" certain factors, "[t]hat means only that it must reach an express and considered conclusion about the bearing of a factor, but is not required to give any specific weight to it." *Time Warner Entertainment Co.* v. *FCC*, 56 F.3d 151, 175 (D.C. Cir. 1995) (internal quotation marks omitted), cert. denied, 516 U.S. 1112 (1996); see also *United States* v. *RCA*, 358 U.S. 334, 351-352 (1959).

Finally, there is no merit to the incumbents' unelaborated proposal for greater regulatory intervention "to

---

[29] As the Eighth Circuit observed, the Commission's application of Section 251(d)(2) "is not toothless." Pet. App. 49a; see, *e.g.*, J.A. 52-53 (¶ 284) (describing circumstances in which a "new entrant should not have access to proprietary information * * * where it is not necessary to provide service"). The incumbents nonetheless claim that, as to proprietary elements, restrictive regulations are required to preserve an incumbent's incentive to offer innovative services. *E.g.*, Bell Atl. Br. 67-68. In a passage they ignore, however, the Commission determined that its approach "will stimulate innovation in the market, offsetting any hypothetical reduction in innovation by the incumbent LEC," and that "the threat to competition" from the incumbents' restrictive alternative "would far exceed any costs to consumers resulting from reduced innovation by the incumbent LEC." J.A. 51 (¶ 282). That predictive judgment is entitled to particular deference, as the Eighth Circuit observed. Pet. App. 49a-50a. Finally, it bears repeating that, when incumbents make any of their facilities available to new entrants under Section 251(c)(3), they are entitled to compensation at cost-based rates that "may include a reasonable profit." 47 U.S.C. 252(d)(1)(B).

promote facilities-based competition." Bell Atl. Br. 66. As discussed, when rates for an incumbent's elements are set properly, new entrants will have incentives to build new facilities when, and only when, it is efficient to do so. See pp. 34-36, *supra*. "As a practical matter, if it is more efficient and less costly for new entrants to obtain network elements from a source other than an incumbent LEC, new entrants will likely pursue the more efficient and less costly approach." J.A. 54 (¶ 287). In effect, the incumbents want a rule restricting new entrants to more expensive or less efficient means of obtaining the elements they seek. Such a rule, the Commission reasonably found, would "inhibit new entry," "restrict the potential for meaningful competition," and thus "undermine the procompetitive goals of the 1996 Act." *Ibid.*; see also Pet. App. 48a (agreeing with Commission).

2. The Commission's Determinations Concerning OSS, Vertical Switching Features, And Operator Services Were Reasonable

a. Because an incumbent retains ultimate physical control over its network elements even when new entrants lease them under Section 251(c)(3) (see J.A. 38 (¶ 258)), it keeps detailed information in various databases about the underlying facilities serving all customers, including customers who have chosen other local carriers. Those databases and their associated programs—which handle maintenance, repair, ordering, provisioning, billing, and other functions—are the incumbent's "operational support systems," or OSS. The question here is whether a new entrant may gain access to the incumbent's OSS as an efficient means of obtaining needed network and service information and of manipulating network elements to provide services to its new customers.[30] Without an efficient electronic interface between the incumbent's OSS and the

---

[30] The question is thus *not* whether new entrants may appropriate an incumbent's general "business skills" (Bell Atl. Br. 69). See J.A. 118 (¶ 518); 47 C.F.R. 51.319(f)(1).

new entrant's own systems, a new entrant would have to resort, at best, to slower and more cumbersome means of obtaining essential network information, processing customer requests, and securing maintenance and repair functions. The new entrant might find it impossible, for example, to conduct basic customer transactions (such as providing an installation date) in a single call. As the Commission found, that disparity in responsiveness would preclude a competitor from making efficient, competitive use of the incumbent's network elements. See J.A. 116-122 (¶¶ 516-522).

The Commission directed incumbents to provide nondiscriminatory access to their OSS on alternative grounds: (1) OSS falls within the statutory definition of "network element" (in two different respects), and (2) "nondiscriminatory access to the functions of operations support systems, which would include access to the information they contain, could be viewed as a 'term or condition' of unbundling *other* network elements under section 251(c)(3), or resale under section 251(c)(4)." J.A. 117-118 (¶ 517) (emphasis added). The latter ground is independent of, and as important as, the first: a new entrant's access to elements used in providing service cannot be "nondiscriminatory," as required by Section 251(c)(3), if the incumbent, by denying access to its OSS, can prevent the new entrant from using those elements as efficiently as the incumbent could use them. See also 47 C.F.R. 51.311(b). Significantly, as in the court of appeals, and as in their cross-petitions for certiorari, the incumbents *do not challenge this nondiscrimination ground*. See 97-1087 Fed. Br. in Opp. 14-15 (noting waiver of claim). That waiver is fatal to their challenge: the Commission emphasized that this was an independent basis for its decision. See J.A. 117-118 (¶ 517) ("under *any* of these interpretations, operations support systems functions are subject to the nondiscriminatory access duty imposed by section 251(c)(3)") (emphasis added). For that reason alone, this

Court should affirm the portion of the judgment below addressing OSS.

In any event, the Commission reasonably *also* found that OSS falls within Section 3(29)'s two-part definition of "network element." See 47 U.S.C. 153(29). First, operational support systems readily qualify as "facilit[ies] * * * used in the provision of a telecommunications service," and their functions are "features, functions, and capabilities that are provided by means of such facilit[ies]." *Ibid.*; see J.A. 117 (¶ 517)); Pet. App. 42a-43a (agreeing with Commission).[31] Moreover, the second sentence of Section 3(29) includes what is largely an express *itemization* of OSS: "databases * * * and information sufficient for billing and collection or used in the transmission, routing, or other provision of a telecommunications service." 47 U.S.C. 153(29); J.A. 117 (¶ 517); Pet. App. 43a. The incumbents' approach would exclude several *enumerated* items—such as "databases" and "billing and collection" information—from the scope of the network elements to which new entrants may gain efficient, nondiscriminatory access, and that alone confirms that their approach is wrong.[32] See Pet. App. 43a-44a.

---

[31] See *Random House Dictionary of the English Language* 690 (2d ed. 1987) (defining "facility" as "something designed, built, installed, etc., to serve a specific function affording a convenience or service" or "something that permits the easier performance of an action, course of conduct, etc."); 47 U.S.C. 153(46) (defining "telecommunications service" as "the *offering* of telecommunications for a *fee* directly to the public") (emphasis added).

[32] The incumbents suggest (*e.g.*, Bell Atl. Br. 69) that the definition of "network element" is restricted to "equipment used to route or transmit a call." That is plainly incorrect, as the statutory references to "billing," "collection," and "databases" make clear. Moreover, as the Commission and the Eighth Circuit observed, the incumbents' view would read out much of Section 3(29), which embraces a range of items "used in the transmission, routing, *or other provision* of a telecommunications service" (emphasis added). See J.A. 40, 116-117 (¶¶ 261, 516); Pet. App. 42a-44a. In any event, OSS *is* used in the "ordering, provisioning, maintenance and repair" of network transmission facilities. J.A. 118 (¶ 518); see also 47 C.F.R. 51.5. Similarly, as discussed

Finally, if Sections 3(29) or 251(c)(3) were ambiguous on this or any other issue, the Commission's approach would be entitled to substantial deference. See *Chevron*, 467 U.S. at 843-844.

b. The incumbents next contend that the Commission improperly designated vertical switching features (*e.g.*, call forwarding, caller identification, and call waiting) as "network elements." Bell Atl. Br. 71-72. In fact, however, the Commission expressly declined to unbundle the switch "into a basic switching element and independent vertical feature elements." J.A. 88 (¶ 414). What the Commission *did* determine is that vertical features "are provided through operation of hardware and software comprising the 'facility' that is the switch"; that they are thus "'features' and 'functions' of the switch"; and that new entrants obtaining access to the switch are entitled to make use of those functions (just like other functions) of the element they have paid for. J.A. 87-88 (¶ 413) (quoting 47 U.S.C. 153(29)).

Without any textual basis, the incumbents would carve out of that switching element, and deny to new entrants, whatever functions the incumbents provide as retail services to their customers. See Bell Atl. Br. 72. That proposal flies in the face of Sections 3(29) and 251(c)(3), and the Commission reasonably rejected it. J.A. 87-88 (¶ 413). As the Eighth Circuit recognized, Section 251(c)(3) entitles new entrants to gain access to elements used in providing services whether or not the incumbent also offers those services to its customers and whether or not the new entrant could therefore resell them. Pet. App. 45a; see also pp. 36-41, *supra*. Indeed, the incumbents' approach would invite obvious abuse, as the Commission found: it would encourage them to evade their unbundled access duties altogether by recharacterizing elements as

---

below, operator services and vertical switching features (*e.g.*, call forwarding) are also part of the call-routing network.

"services" and selling them as such to end users. J.A. 41 (¶ 263); see also Pet. App. 45a.

c. "Operator services" are the increasingly automated network "facilities and functionalities" (J.A. 125 (¶ 534)) that use hardware and software to route calls through the network and perform a variety of other call-related tasks, such as the disposition of calling-card (and other "0+") calls. See 47 C.F.R. 51.5. Similarly, "directory assistance" facilities enable callers to find, and complete calls to, the numbers they wish to call. The Commission found that "these facilities and functionalities are important to facilitate competition in the local exchange market," and that they fall within the two-part definition of "network element." J.A. 125-126 (¶ 534). The Eighth Circuit affirmed. Pet. App. 42a.

Because they are directly involved in call-routing, "operator services" fall within even the incumbents' cramped misdefinition of "network elements." See p. 47 and note 32, *supra*. The incumbents nonetheless conflate "operator services" with "live operators" and conclude that Congress could not have meant to include "people" within the scope of Section 251(c)(3). GTE Br. 57. "Operator services" and "directory assistance," however, describe complex network facilities and functionalities, not just the people who run them. Any element is controlled by people, and human involvement does not somehow remove an element from the scope of Section 3(29). Moreover, the incumbents' equation of "operator services" with "live operators" is anachronistic, as anyone with a calling card knows: such services, like directory assistance, are largely (and increasingly) automated. Finally, as with vertical features, nothing in the Act prohibits new entrants from obtaining access to network elements that an incumbent, characterizing such elements as "services," may provide to its customers. Pet. App. 42a, 44a-45a.[33]

---

[33] We rest on the discussion in our opening brief (at 48-50) of the Commission's rules interpreting Section 252(i). We add two brief observations here. First, respondents' interpretation of that provision

CONCLUSION

The relevant portions of the judgments below invalidating the Commission's rules should be reversed, and the relevant portions upholding those rules should be affirmed.

Respectfully submitted.

(*e.g.*, Bell Atl. Br. 73) reads "any * * * element" (of an agreement) to mean "all elements." That is not what Congress wrote or meant. Second, if this issue turns on a dispute about the extent to which the Commission's rules protect the incumbents against the plain language of this provision (see Bell Atl. Br. 74 n.43), the proper course is to remand to the Commission for clarification on that issue, not to impose respondents' own countertextual view of Section 252(i).

ARGUMENT

Respondents and cross-petitioners confirm that the FCC had jurisdiction to adopt its pricing and other rules and that each of the challenged local competition rules is substantively valid. In particular, when their briefs are stripped of their rhetoric, they are challenging the FCC's rules by (1) ignoring the nature of the facilities and services that the rules address, (2) misstating the express terms of the Communications Act, and (3) relying on "policies" that Congress did not enact and that respondents' positions would not advance.

I. THE FCC HAS JURISDICTION TO IMPLEMENT ALL THE ACT'S LOCAL COMPETITION PROVISIONS.

The respondents' briefs have defended the Eighth Circuit's jurisdictional holdings by misstating the bases of the FCC's authority and the terms of the Act. In particular, contrary to respondents' assertions, petitioners are not claiming that the FCC has jurisdiction because "Congress would *never* pass a communications statute without intending the FCC to superintend every aspect." Bell Atl. Br. 29.

Rather, the point is that, in contrast to other provisions enacted by the Telecommunications Act of 1996, Congress deliberately codified the new local competition provisions as §§ 251-76 of the Communications Act. See AT&T Br. 22 & n.12. By doing so, Congress gave the FCC authority to "execute and enforce" these new provisions (47 U.S.C. § 151), to "prescribe such rules and regulations as may be necessary to . . . carry out the provisions," (*id.* § 201(b)), and otherwise to enforce them. *Id.* §§ 154(i), 208, 303(r). Moreover, § 251(d)(1) mandated that the FCC adopt regulations implementing the requirements of § 251 within six months of its enactment and before the States conclude the arbitration

decisions that are reviewable only in federal district court and under federal law.

Further, it is simply not the case that the FCC's rules under §§ 251-252 intrude on the States' historic jurisdiction over "intrastate services." In particular, contrary to respondents' repeated assertions, the facilities and arrangements at issue will be used to provide not just retail "intrastate services," but also "exchange access" services that are overwhelmingly "interstate services" that the FCC has regulated for 60 years. Moreover, as no party disputes, the original Communications Act of 1934 gave the FCC jurisdiction over rates, terms, and conditions in which customers lease the same local loops and other associated facilities that will here be used for interstate as well as intrastate calls (AT&T Br. 5-6 & n.3). The FCC's rules thus exercise the jurisdiction over leased facilities that the FCC always had, while implementing new resale and transport arrangements that are provided in conjunction with the leased facilities.

For these reasons, respondents have primarily devoted their briefs to defending only the Eighth Circuit's holding that the FCC lacks jurisdiction over the pricing provisions of the Act, and to arguing only that § 252(c) expressly denies the FCC jurisdiction over the pricing requirements of §§ 251-52 that it otherwise would have. But the FCC would have jurisdiction over these pricing and other requirements of §§ 251 and 252 even if respondents' reading of § 252(c) were a possible one -- as it is not.

A. Section 201(b) Gives The FCC Jurisdiction Over All The Act's Requirements.

Because § 201(b) authorizes the FCC to adopt rules to carry out each provision of the Communications Act, its terms authorize the FCC to adopt rules to implement all the pricing and other requirements of the Act, including the provisions of

§ 252(c) that are claimed (erroneously) to require states to establish prices solely under the standards of § 252(d). That is why the LEC and state commission respondents are reduced to contending (in arguments buried in the backs of their briefs) that § 201(b) cannot or should not mean what it plainly says.

Respondents' principal argument, again, is based on their assertions that the substantive requirements of the first sentence of § 201(b) do not apply to the services and facilities that § 251(c) requires LECs to provide. But even if that claim were correct, § 201(b) expressly grants the FCC rulemaking authority to implement the "provisions of this Act," and there is no basis for the claim that this authority can somehow be "limited to [the] interstate communication" purportedly addressed in the first sentence of this "section." GTE Br. 33; Bell Atl. Br. 43; States Br. 26-27. That is particularly so because other sections of the Act direct the FCC to adopt regulations implementing only the requirements of "this section" (*e.g.*, §§ 251(d)(1), 317(e)) and not the entire "Act."

The LECs also claim that Congress could not have intended to give the FCC the same § 201(b) rulemaking power over §§ 251-76 that it had over the original provisions of the Act and that "the FCC cannot pluck such a generalized term out of the 1934 Act" and apply it to the "1996 Act's" local competition provisions. GTE Br. 34. The reason, they say, is that this would "give the FCC intrastate jurisdiction denied to the agency by section 2(b)" and would mean that Congress "wasted its breath" when it adopted § 2(b). Bell Atl. Br. 43-44.

However, §§ 2(b) and 201(b) are each "generalized term[s] out of the 1934 Act." If § 201(b) and the other general grants of jurisdiction over all the Act's requirements were somehow inapplicable to §§ 251-76, then so, too, would be § 2(b). But because Congress deliberately codified the new local competition provisions in the Communications Act (AT&T Br.

22 n.12), the jurisdictional grant of § 201(b) and § 2(b)'s rule of construction each are applicable to §§ 251-76.

Contrary to the LECs' claims, there is also no conflict between § 2(b) and § 201(b), for § 2(b) places no limitation on § 201(b)'s express grant of rulemaking authority over the provisions of the Act. Rather, § 2(b) merely provides that no provision of the Act may be "*construed* to apply *or* to give the [FCC] jurisdiction" over intrastate services. Because the substantive requirement of §§ 251 and 252 unambiguously "apply" to intrastate matters, § 201(b) and the Act's other general provisions expressly grant the FCC the same jurisdiction over those intrastate matters addressed in §§ 251-52 as it has over the interstate services to which other provisions of the Act apply. No "construc[tion]" of the Act is required to "give" the FCC jurisdiction over the requirements of §§ 251-52. Thus, the effect of § 2(b) here, as elsewhere, is to bar the FCC from asserting "protective" jurisdiction (as the ICC had done in the *Shreveport Rate Cases*, 234 U.S. 342 (1914)) over those aspects of intrastate services to which provisions of the Act do not unambiguously apply (*e.g.* the retail rates that LECs and new entrants charge their customers). See MCI Br. 45, AT&T Br. 12 n.9.

For the same reasons, the States' and the LECs' reliance on *Louisiana Public Service Comm'n* v. *FCC*, 476 U.S. 355 (1986) is misplaced. It held only that where it was unclear whether a statutory requirement (there, depreciation schedules established under § 220) applies to intrastate services, § 201(b) does not authorize the FCC to adopt regulations applying that provision to intrastate services. In this regard, §§ 251-52 no more apply to establishing the *retail* rates charged to end users than did the provisions of § 220 of the Act that were construed in *Louisiana*, so §§ 251-52 do not alter *Louisiana*'s holding that the FCC has no jurisdiction over intrastate exchange and exchange access rates.

By contrast, because all concede that §§ 251-53 apply to the intrastate as well as the interstate aspects of the new *wholesale* arrangements that will enable new entrants to offer competing exchange and exchange access services, § 201(b) authorizes the FCC to adopt regulations implementing all the requirements of §§ 251 and 252, including the requirements of § 252(c)(2) and § 252(d) insofar as they govern the arbitration proceedings that states conduct. Congress here followed this Court's holdings that there is no inconsistency between granting ratemaking authority to a state tribunal and authorizing a federal agency to adopt rules prescribing the specific standards that States are to apply in establishing rates. *Wilder* v. *Virginia Hospital Assoc.*, 496 U.S. 498, 516 (1990).

B. Section 251(d)(1) Independently Establishes The FCC's Authority To Adopt Pricing As Well As Non-Pricing Rules.

Further, even if § 201(b) and the Act's other general provisions did not give the FCC rulemaking authority over all the requirements of §§ 251-76, the FCC's authority to adopt all its pricing and other local interconnection rules would be established by § 251(d)'s requirement that the FCC "establish regulations to implement the requirements of this section" by August of 1996. As previously explained (AT&T Br. 24-25), there is no substance to respondents' various efforts to argue that the phrase "the requirements of this section" can be read to mean "only the areas in § 251 where Congress explicitly called for the FCC's involvement." States Br. 20.[1]

---

[1] Remarkably, respondents also simultaneously argue that "[b]y stating that the FCC must consider certain factors 'in determining what network elements should be made available,' [section 251(d)(2)] *itself* necessarily authorizes the FCC to make such a 'determination' in the first place." Bell Atl. Br. at 39. However, if the terms of § 251(d)(2) constituted a sufficiently clear grant of authority, then the virtually identical phrase in section 251(d)(3) -- "in

(continued...)

Respondents thus now claim that even if § 251(d)(1) established the FCC's authority to adopt rules to implement "the requirements of" § 251, the FCC cannot adopt pricing rules because pricing is addressed in § 252, not in 251. Bell Atl. Br. 34; GTE Br. 31. This claim is simply wrong. Section 251 requires incumbent LECs to charge (1) prices for interconnection and network elements that are "just, reasonable, and nondiscriminatory" (2) "wholesale" rates for resale, and (3) "just and reasonable" rates for co-location. §§ 251(c)(2),(3),(4),(6). By contrast, all § 252(d) does is supply statutory standards that limit the discretion of the FCC and the state commissions and that govern the setting of prices for *some* of these arrangements in arbitration proceedings. The FCC's pricing rules thus implement "requirements" of § 251.

However, because §§ 251(c)(2) & (3) incorporate the "requirements . . . of Section 252" by reference, GTE argues that a LEC's sole duty under § 251(c) is to charge the rates that state commissions establish under the requirements of § 252 and include in interconnection agreements.[2] GTE Br. 32. But this claim, too, is foreclosed by § 251(c)'s terms. Sections 251(c)(2) & (3) require LECs to charge rates that are "just, reasonable, and nondiscriminatory in accordance with the terms and conditions of the agreement [established under § 252] and the requirements *of this section* [251] *and* section 252." 251(c)(2) (emphasis added). Thus, § 251(c) imposes duties on LECs to charge rates that are just and reasonable and consistent with the

---

[1] (...continued)
prescribing and enforcing regulations to implement the requirements of this section" -- would itself authorize the FCC to "prescribe" and "enforce" the "requirements of" section 251. Respondents cannot have it both ways.

[2] This is also the premise of the BOCs' equally erroneous claim that § 271 of the Act does not require the FCC independently to determine whether a BOC is charging prices that satisfy §§ 251 and 252(d) in ruling on applications for long distance authority. *See* Bell Atl. Br. 41-42.

requirements of § 251 and § 252(d) as well as with the interconnection agreements that state commissions establish in arbitrations. Further, as Bell Atlantic (Br. 35) correctly states, the provisions of § 251(c)(4) and § 251(c)(6) do not even refer to § 252. In short, § 251 plainly imposes pricing requirements that are independent of both § 252(d)'s standards and the specific pricing determinations that States make in arbitration proceedings.

C. The FCC's Authority To Adopt Pricing Rules Is Not Impliedly Repealed By § 252(c), But Is Confirmed Both By Its Terms And Those Of §§ 160, 253, And 271.

Next, respondents argue that even if §§ 151, 201(b), or 251(d) granted the FCC rulemaking authority over all the Act's local competition requirements, § 252(c) of the Act takes away the FCC's jurisdiction over pricing. They contend that § 252(c) "express[ly]" grants any State that elects to conduct arbitration proceedings the "exclusive" authority to construe the Act's pricing requirements in the first instance and frees them from following FCC pricing regulations. GTE Br. 34. However, § 252(c) does no such thing. To the contrary, it expressly provides that "[i]n resolving by arbitration . . . *any* open issues . . . a State commission *shall* (1) ensure that such resolution and conditions meet the requirements of section 251 of this title, *including the regulations prescribed by the Commission*"; [*and*] (2) "establish any rates . . . according to subsection (d)." § 252(c) (emphasis added). Because pricing issues are clearly among the "open issues" that state commissions must arbitrate, § 252(c) requires States to comply with both any pricing regulations that the FCC adopts and the standards of § 252(d).

Respondents' contrary claims all rest on an attempt to give § 252(c)'s terms a meaning that they cannot bear and that is foreclosed by numerous other provisions of the Act. In

particular, they claim that § 252(c) created a "clear dichotomy between pricing and other matters." Bell Atl. Br. 23. They assert that § 252(c)(1) requires States to comply with FCC regulations in resolving any open non-pricing issues, but that pricing issues are addressed "as a separate matter" in § 252(c)(2) which, respondents claim, requires that the states "solely" follow the standards contained in § 252(d). GTE Br. 28-29. Because § 252(d) "makes no mention of the FCC" (GTE Br. 29, 32), respondents claim that the States that choose to conduct arbitrations were granted the "exclusive" authority initially to interpret the federal pricing standards. However, the Act's terms and structure foreclose any claim that there is such a "dichotomy."

Section 252(c). First, respondent's claims are foreclosed by § 252(c)'s terms. The phrase "any open issues" cannot be limited to "non-pricing issues," for the phrase does not appear in § 252(c)(1). Rather, this phrase is contained in the preamble to § 252(c), and the States' duties in resolving any "open issues" are thus defined in *each* of § 252(c)'s three subsections. Conversely, § 252(c)'s language and structure forecloses the respondents' argument that the phrase "any open issues" can be read to mean only "any non-pricing issues" and that the States' duty to follow FCC regulations applies only to non-pricing issues. Indeed, because the phrase "any open issue" applies to § 252(c)(2), respondents' claims would render it absurd. The section would then provide that "in resolving any *non-rate* issues . . . a State Commission shall . . . (2) establish [] *rates*." As a matter of simple grammar, the phrase "any open issues" must include rate issues.

Second, contrary to respondents' arguments, § 252(c)(2) does not say that States are to follow "solely" the standards contained in § 252(d) when they establish rates. The word "solely" appears only in the LECs' brief and not in § 252(c)(2)'s terms. Indeed, the other provisions of the Act -- and

respondents' own concessions -- establish that § 252(c)(2) could not permit a State to establish rates "solely" based on the standards of § 252(d). As both the States and the LECs have conceded, there are at least some FCC regulations that States must follow in setting rates. For example, respondents concede (Bell Atl. Br. 38; States Br. 33) that the FCC has the exclusive authority to determine how LECs recover costs for numbering administration and number portability. See § 251(e)(2). As the Eighth Circuit recognized, the state commissions will have to comply with the FCC's rules that govern whether or how those costs are included in rates for network elements, interconnection, or resale. Otherwise, LECs would not recover these costs, or would recover them twice. Pet App. 89a-91a. Similarly, while the Act requires LECs to provide collocation at "just" and "reasonable" rates, § 252(d) provides no standards for establishing collocation rates. These and other pricing issues can thus only be governed by the terms of § 251 and the FCC's regulations under them.

Third, rather than prescribe that rates be determined "solely" under § 252(d)'s standards, Congress linked the requirements of § 252(c)'s subsections by the conjunctive "and." That demonstrates that the FCC had it exactly right. State commissions must resolve all open issues, including pricing issues, in a manner (1) that is consistent with whatever pricing regulations the FCC chose to adopt (§ 252(c)(1)) and (2) in the case of rates, that also comply with § 252(d)'s pricing standards. That is not a "tortured reading." GTE Br. 29. That is exactly what the language Congress wrote says.[3]

---

[3] Similarly, GTE's claim (p. 29) that § 252(d) "conspicuously omits any mention of the FCC" is wrong. Section 252(d)(2)(B)(ii) explicitly mentions the FCC and further confirms Congress' understanding that both the FCC and the state commissions would have a role in construing § 252(d)'s language.

Similarly, this language does not render § 252(c)(2) and the pricing standards of § 252(d) "wholly superfluous." Bell Atl. Br. 24. These sections control the resolution of all ratemaking issues that are not addressed in FCC regulations. In this regard, the FCC pricing rules before the Court in fact did not address two of the three major components of ratemaking (cost of capital and depreciation), but left those for the States to determine under only the general standards of § 252(d) and § 251(d). Sections 252(c)(2) and 252(d) apply to the resolution of all such pricing issues.

Finally, there is no basis for respondents' claim that the "drafting history" of the 1996 Act establishes that Congress nonetheless intended a "clear dichotomy" in which "pricing" was committed to the States under the standards of § 252(d) and FCC regulations governed only non-pricing issues. Bell Atl. Br. 24-25. In particular, they contend that the Senate Bill on which §§ 251 and 252 were based did not contain this "dichotomy," but would have required States to follow FCC regulations in setting rates (States Br. 25; Bell Atl. Br. 24; GTE Br. 30). But they assert the Conference Committee amended the bill to create a "clear dichotomy" between rate and non-rate issues. This contention, too, is baseless. Like § 252(c), the Senate Bill had one subsection (§ 251(d)(5)) requiring States to resolve all open issues in accord with FCC regulations[4] and a separate subsection (§ 251(d)(6)) that directed States to

---

[4] Section 251(d)(5) of the Senate Bill, entitled "Action by State," provided that "In resolving any open issues and imposing conditions upon the parties to the agreement, a State shall ensure that [those requirements and conditions] are . . . consistent with the Commission's rules defining minimum standards." S. 652, 104th Cong. § 101 (1995), *reprinted in* S. Rep. No. 104-23, at 92.

establish rates also under the standards now codified in § 252(d).[5]

Sections 160, 253 and 271. That §§ 252(c)(2) and 252(d) do not repeal the FCC's authority over local pricing requirements is also vividly confirmed by other terms of the Act. First, § 160 expressly authorizes the FCC to forbear "from applying the requirements of section 251(c)" (§ 160(d)) only "if the Commission determines that (1) enforcement of [section 251(c)] is not necessary to ensure that the *charges* . . . for, or in connection with that . . . service are *just* and *reasonable*." § 160(a) (emphasis added). Section 160 thus presumes that the FCC will construe § 251(c)'s pricing requirements.

Contrary to respondents' claim (GTE Br. 36), petitioners made this argument below, and the Eighth Circuit rejected it by making the same claim that the state commissions and GTE now advance: that § 160(a) refers to "charges" "to ensure that the new regulatory forbearance measure would apply to all the charges for interstate service that the FCC has long controlled." *Compare* GTE Br. 37 & States Br. 27 *with* Pet. App. 86a. That argument, however, ignores that Congress expressly directed the FCC to apply § 160(a)'s standards in determining whether to forbear from enforcing "the requirements of § 251(c)." § 160(d). The only "charges" that would be relevant to that determination would be the charges for the facilities and services provided under § 251(c).

The BOCs thus try a different tack. They argue that § 160 authorizes the FCC to forbear from applying only the non-pricing requirements of § 251(c), and does not imply that the

---

[5] Section 251(d)(6) of the Senate Bill, entitled "Charges," provided pricing standards virtually identical to those in 252(d)(1) that were to be applied whenever rates were "determined by arbitration," and made no reference to FCC regulations. *Id.*

FCC has "pricing jurisdiction." Bell Atl. Br. 41 n.22. But the BOCs, too, ignore that § 160(d) itself provides that the FCC may only forbear from enforcing § 251(c) if the FCC "determines" that the "charges" will be "just" and "reasonable." Congress could not have authorized the FCC to make that determination if it has no "role" to play in defining § 251(c)'s pricing requirements. Bell Atl. Br. 21.

Respondents likewise fail to reconcile their jurisdictional claims with § 271 and § 253. Section 271 expressly authorizes the FCC to determine the lawfulness of BOC prices in ruling on applications for long distance authority. See p. 6 n.2, *supra*. Section 253 further authorizes the FCC to "preempt" any state "order" or "requirement" whose "effect" is to create a "barrier[] to entry." § 253. Respondents do not deny that the FCC can exercise its § 253 authority to preempt state pricing requirements that have the effect of barring entry. Nor could they. A "barrier to entry" is classically defined as any condition which requires new entrants to bear costs greater than those borne by the incumbent (see R. Posner, *Economic Analysis of Law* 312 (1992)), and a State's pricing methodology that imposed excessive costs on new entrants would fall squarely within that definition. Indeed, the FCC's pricing rules rest on that very finding. J.A. 147-162 (¶ 704-723). Thus, respondents argue that § 253 authorizes the FCC to preempt state orders only through adjudication, and not rulemaking. Bell Atl. Br. 40-41; States Br. 28; GTE Br. 36. But that argument is wrong as a matter of administrative law. FCC Br. 24. More fundamentally, it misses the point. Once it is acknowledged that § 253 authorizes the FCC to preempt state pricing rules through either rulemaking *or* adjudication, the FCC cannot be denied pricing jurisdiction under §§ 251 and 252 in order to "leave[] the traditional federal-state division wholly intact." Bell Atl. Br. 28.

D. Section 2(b) Does Not Deprive the FCC of Jurisdiction Over The Pricing Requirements.

Finally, respondents alternatively argue that § 2(b) "prohibit[s] the FCC from adopting rules" implementing the Act's pricing standards. States Br. 30. However, respondents concede that § 2(b) is simply a rule of "construction" that is overcome by "straightforward" language that grants the FCC jurisdiction to regulate intrastate matters (States Br. 32, Bell Atl. Br. 28). The local competition provisions of §§ 251 and 252 concededly "apply" to "intrastate" matters, and the other terms of the Act (*e.g.*, §§ 201(b) & 251(d)(1)) are even more "straightforward" and unambiguous in "giving" the FCC "jurisdiction" over all the pricing and nonpricing requirements of these sections. *See* pp. 2-7, *supra*.

In addition, respondents are wrong in repeatedly asserting that LECs' provision of the network elements, interconnection, and other arrangements addressed in § 251(c) are "intrastate services." As petitioners' opening brief explained in detail and as no respondent denies, it was well-established prior to the 1996 Act's amendments to the Communications Act that the FCC has *exclusive* jurisdiction to set the rates and other terms by which customers obtained local loops -- and other dedicated facilities -- that the customer then used to complete both interstate and intrastate calls. AT&T Br. 5-6, 28. For example, while § 2(b) divides authority to regulate finished *services* along inter- and intrastate lines, a different rule applies when a customer leases local loops and capacity from a carrier to be used by the customer in creating a "private network." The rates for that equipment and capacity were set exclusively by the FCC whenever that network was used to complete even a single

interstate phone call.[6] Contrary to Bell Atlantic's statement (Br. 15, 30), it is not merely the case that "some" courts of appeals upheld this FCC jurisdiction. This jurisdiction was affirmed by every court of appeals decision that addressed the issue before the 1996 Act was passed, and this Court cited this line of authority with approval in *Louisiana*, 476 U.S. at 375-76 n.4.

The interconnection arrangements required by §§ 251-52 include precisely the same facilities whose rates and other terms the FCC has thus long regulated as "private lines." For example, purchasers of combinations of network elements, like the private line customers, lease local loops and associated switches and transmission capacity at a single price and use them to provide interstate as well as intrastate service. That does not mean the 1996 Act was not needed. Bell Atl. Br. 32. It means that the provision of the Act that alters the division of state and federal authority is § 253, which authorizes customers to use facilities leased under FCC regulations to provide retail services in competition with LECs. Further, while the LECs correctly state that other features of the interconnection arrangements required by § 251 (*e.g.*, wholesale services for resale and transport and termination) are generally now used only for intrastate services (Bell Atl. Br. 31), §§ 251-52 require that they be offered in conjunction with the network elements, interconnection, and co-location arrangements over which the FCC has always had exclusive pricing jurisdiction.

---

[6] Like other federal agencies (*see Arkansas Elec. Coop. Corp.* v. *Arkansas PSC*, 461 U.S. 375, 383-84 (1983)), the FCC can choose to defer to state regulation. *See New York Telephone Co.* v. *FCC*, 631 F.2d 1059 (2d Cir. 1980); *Diamond Int'l Corp.* v. *FCC*, 627 F.2d 489 (D.C. Cir. 1980). Contrary to California's suggestions (Br. 44), that is what the FCC did when it followed the recommendation of the joint federal-state board and decided no longer to exercise its jurisdiction where fewer than 10% of the calls over a private line network were interstate. *MTS*, 4 FCC Rcd. 5660 (1989).

Respondents also make extended arguments that it is theoretically possible to "separate" the prices for access and interconnection into interstate and intrastate components -- with the FCC regulating them insofar as the facilities were used for interstate calls and the States setting the rates for the intrastate use of those facilities. Bell Atl. Br. 33. These claims are beside the point. Whatever alternative regime Congress might have theoretically been able to enact, §§ 251-52 provide that one set of rates would be established by one arbitrating body, and that those rates would apply to both the interstate and intrastate uses of the equipment and services at issue. That is why not a single commenter before the FCC, including the state commissions, could contend that "the FCC's role is to establish rules for only the interstate aspects of interconnection, and the states' role is to arbitrate and approve only the intrastate aspects of interconnection agreements." Pet. App. 194a-195a (¶ 92).

In sum, Congress enacted a statutory scheme over which the FCC had clear rulemaking authority under settled interpretations of § 201(b) and § 2(b). That is so both because all the Act's local competition requirements are codified in the provisions of the Communications Act over which the FCC has jurisdiction and because they apply to interstate as well as intrastate aspects of local loops and other facilities that customers obtain on an "unseparated" basis: that is, under a single set of rates applicable to the facilities as a whole. Indeed, Congress removed any doubt on the subject by providing that "[n]othing in this section shall be construed to limit or otherwise affect the Commission's authority under section 201 of this title." 47 U.S.C. § 251(i). Thus, the Eighth Circuit's judgment should be reversed both insofar as it vacated FCC rules on jurisdictional grounds and insofar as it vacated other rules on the false premise that the FCC had authority only to interpret six subsections of § 251 and not the authority under § 201(b) to

adopt whatever rules are reasonably necessary to "carry out" § 251's requirements.[7]

II. THE FCC RULES REQUIRING INCUMBENTS TO PROVIDE NONDISCRIMINATORY ACCESS TO COMBINATIONS OF NETWORK ELEMENTS ARE ALL VALID.

Section 251(c) establishes three potential modes of competitive entry: (1) constructing an alternative local network and interconnecting with the LEC under § 251(c)(2); (2) providing service through LEC network elements under § 251(c)(3); and (3) reselling LECs' retail services under § 251(c)(4). However, here, as in the Eighth Circuit, the LECs have focused virtually their entire litigation effort on challenging the FCC rules that govern the provision of combinations of network elements under § 251(c)(3). That is because these rules provide the only realistic near-term opportunity for broad-based competition to their monopolies and is essential to widespread future construction of alternative local networks that could create even greater benefits for consumers.

The reality is that any attempt now to construct alternative facilities of any significant scope would be prohibitively expensive and otherwise infeasible for even the largest new

---

[7] Respondents do not dispute AT&T's showing (Br. 32-34) that the Eighth Circuit's jurisdictional holdings meant that it did not apply the standards of § 201(b) in reviewing FCC rules that were not adopted as interpretations of these six subsections. However, they claim that AT&T did not present this issue in its Petition for Certiorari. *E.g* Bell Atl. Br. 46 n.27. That is false. *See* Pet. Cert. i (Question Presented) ("Whether . . . the FCC's authority over the remaining non-pricing requirements is limited to adopting narrow interpretative rules?"); 9-10 (discussing the portions of the Eighth Circuit's opinion invalidating these rules on this basis); 13 (stating the Eighth Circuit's erroneous standard of review was one of two consequences of its erroneous jurisdictional holding).

entrants.[8] Nor does resale pose any serious competitive threat to the LECs' monopolies. The reseller may provide only the precise retail services the LEC already provides. It cannot provide the exchange access services that generate some 35% of local service revenue, and it cannot offer innovative new or other retail services that the LEC chooses not to provide. Further, resale has no effect on the LECs' monopoly profits, for the price the LEC will charge the reseller under the Act is equal to its retail price for the service minus whatever costs it avoids by acting as a wholesaler rather than a retailer. See § 252(d)(3). Resale thus protects the supracompetitive prices the LECs presently charge, precludes new entrants from providing the full range of services that LECs offer, and presents no meaningful opportunities for competitive innovation or differentiation.

Section 251(c)(3), by contrast, authorizes a new entrant to lease components of the LECs' networks at their full economic cost (including a full return on LEC investment) and to use those elements to provide any wholesale exchange services or other retail services the elements will support. This allows entry into the entire local service market, and creates genuine opportunities for competition on service quality, on innovation, and on price. Combinations of network elements have been referred to as "the platform" because they allow new entrants

---

[8] *See Local Competition*, 11 F.C.C.R. 14171, 14175 (1996) (it would cost $29 billion to construct even the local facilities needed to reach only 20% of the 117 million access lines served by the BOCs). Thus, while the LECs repeatedly invoke the "facilities-based" local competitors who praised the Eighth Circuit's ruling (Bell Atl. Br. 60-61, 63-64; Ameritech Br. 38-39), these carriers have constructed only limited facilities and compete with the LECs only in the narrow high-volume niche markets where alternative facilities are economically feasible to provide exchange access and related services that are overwhelmingly used by large corporations. These carriers have no plans to engage in more broadbased competition, and it is neither surprising nor relevant that they would oppose the use of combinations of network elements that would lead to competition both in their niche markets and in other local services. *See also* ALTS Opposing Brief.

not only to provide alternatives to LECs' existing services, but also to provide new services by using the capabilities of the network elements in new ways or through facilities of their own that they connect to the network elements obtained from the LEC.

Further, while resellers obtain wholesale services at rates that reflect any subsidies (Bell Atl. Br. 8-9), § 254 requires users of network elements to make the same contributions to universal service as does the LEC or any carrier who has constructed an alternative network. Users of combinations of network elements thus will face the same costs or equivalent costs as the LEC with which they compete. They thus can have an adverse effect on the LEC only if it is charging monopoly prices for business services, exchange access, Caller ID, and other services that allegedly fund universal service -- *i.e.*, prices that exceed the sum of the costs LECs incur in providing the service and of any implicit or explicit subsidies necessary to support below-cost rates for rural or other customers.

The LECs have thus urged proposals whose sole purpose and effect would be to render network element competition economically or practically infeasible. Indeed, the LECs do not dispute that they are seeking authority to engage in discrimination by tearing apart existing combinations of network elements or by engaging in other conduct that would impose unnecessary costs solely on new entrants, degrade any services new entrants offer, allow LECs to "gate" the rate of competitive entry, and thereby protect LECs' monopoly rates. The LECs' two principal claims are that the Court should (1) uphold the Eighth Circuit's decision to invalidate Rule 51.315(b) on the ground that LECs are entitled to "unbundle" network elements by physically disconnecting them from one another, or (2) reverse the Eighth Circuit's holding that LECs may not limit the right to purchase network elements to those new entrants that have constructed some unspecified local exchange facilities of

their own. The LECs profess genuine indifference as to which extrastatutory mechanism the Court adopts to make § 251(c)(3) infeasible so long as it adopts at least one. See, *e.g.*, Ameritech Br. 22-41.

The LECs make no serious effort to argue that any of their proposed limitations is permitted, much less required, by the text of § 251(c)(3). Indeed, they urge the Court not to examine their textual and other legal arguments "in isolation" -- which GTE (pp. 51-52) calls applying *Chevron* "on an 'unbundled basis.'" Instead, the LECs argue that their crippling interpretations of § 251(c)(3) are necessary to achieve three supposed non-textual objectives of Congress: (1) preserving a separate role for the resale authorized by § 251(c)(4), (2) protecting universal service by barring firms from providing cost-based service to high-end customers and using resale to serve customers who receive subsidies, and (3) promoting facilities-based competition to the exclusion of all else. But none of these were objectives of Congress, and the LECs' proposals would not advance them even if they were.

Yet, these "policy" claims are the premise for each of the LECs' proposed interpretations of individual terms of § 251(c)(3) and other interrelated provisions of the Act. We will thus address them before discussing the LECs' individual statutory claims.

A. The Challenges To The Network Element Rules Rest On "Congressional Objectives" That Congress Did Not Have And That The LECs' Positions Would Not Advance.

The crippling interpretations of § 251(c)(3) cannot be justified by any of the three alleged statutory objectives that the LECs have hypothesized. Their specific claims not only are

unfounded when examined individually, but also contradict one another.

1. Combinations of Network Elements Are Not The Equivalent of Resale And The FCC's Rules Preserve Resale As A Meaningful Option.

The fundamental premise of the LECs' argument is that a competitor that purchases a combination of all network elements under § 251(c)(3) obtains the "identical product" as the competitor that purchases services for resale under § 251(c)(4). Bell Atl. Br. 60; see also Ameritech Br. 2, 26 (combination of network elements is "identical to what an entrant acquires when purchasing resale services"). The LECs therefore argue that, since different pricing and other rules apply to network elements and services purchased for resale, the FCC cannot have been correct in interpreting the Act to permit new entrants to purchase an "identical product" under either set of rules. The Eighth Circuit adopted this approach when it held that Congress permitted LECs to disconnect network elements in order to distinguish network elements from resale and thereby "preserve resale as a meaningful alternative." Pet. App. 56a.

But the LECs' premise is false. Because their rhetorical style is to assert disputed propositions as if they were accepted truth and not even to defend them, a reader of their briefs could not know that this precise issue was the subject of detailed findings by the FCC which rejected the LECs' assertion on the basis of a well-developed record. Pet. App. 234a-249a (¶¶ 317-341). The LECs do not acknowledge the FCC's findings or analysis, much less attempt to show that they were "arbitrary" or not based on "substantial evidence." 5 U.S.C. § 706.

As those findings make explicit, combinations of network elements are not remotely "the same" as wholesale services

obtained for resale. Carriers purchasing access to network elements obtain different things at different prices, provide different services, and assume different and greater burdens and business risks than resellers. Pet App. 244a (¶ 331) (purchasers of network elements face "different opportunities, risks, and costs in connection with entry into local telephone markets").

First, the statute itself establishes that purchasers of network element combinations under § 251(c)(3) obtain neither the "same retail services" (Ameritech Br. 16) nor the "same facilities" (*id.*) as purchasers of services for resale under § 251(c)(4). A LEC's obligation to make services available for resale is limited to the exchange or other services that the LEC in fact provides "at retail to subscribers who are not telecommunications carriers." § 251(c)(4). Network elements, by contrast, may be used -- either by themselves or in combination with the new entrant's "back office" or other facilities that it connects to them -- to provide any "telecommunications service." § 251(c)(3). In contrast to resellers of LEC retail services, users of network elements can thus provide any service within the capabilities of those facilities. They allow services that cannot be offered under § 251(c)(4) either because the LEC does not provide the services at all or because the LEC does not provide the services "to subscribers who are not telecommunications carriers."

Thus, for example, a new entrant purchasing network elements will compete in the entire local services market, including competing against the LEC's intrastate and interstate exchange access services -- the origination and termination of long distance calls -- that generate $35 billion in annual LEC revenues. A reseller cannot purchase such services for resale because they are provided to long-distance companies, not to "subscribers who are not telecommunications carriers." § 251(c)(4). Pet. App. 245a (¶ 333). And the provision of originating and terminating access requires capital investment

(by both the LEC and the new entrant) in facilities that bill and collect for exchange access services that resellers never need or pay for. Notably, these are investments that the new entrant must make before it begins providing service to its first retail customer, and that will not be recovered if the entrant is not successful in winning a sufficient number of customers with a sufficient volume of outgoing and incoming long distance usage.

In addition to exchange access services, a new entrant using network elements can use them to develop retail offerings that the LECs may have chosen not to offer, but that the network elements will support. Pet. App. 244a-245a (¶ 333); J.A. 108 (¶ 495). Resellers, by contrast, are confined to offering precisely the same services as the LEC. Although they can place competitive pressure on the LEC by, for example, being more solicitous to customers, they cannot differentiate the underlying service. Pet. App. 244a (¶ 332).

Moreover, because purchasers of network element combinations may use the LECs' network elements to create and provide advanced new services that the LECs do not themselves offer, they do not merely obtain use of the "same facilities" that the LECs use to provide services to resellers, but access additional LEC facilities as well. For example, network element competitors are entitled to access the hardware and software in a LEC's "service creation environment" (SCE) to "design, create, [and] test" such new services. J.A. 108-09 (¶ 495). The SCE is not used, however, when those new services are subsequently provided to customers -- other LEC systems fulfill that function (*id.*) -- so LECs do not employ the SCE when they provide services to resellers.

Given the substantial differences between network element competitors and resellers in what they obtain and how they use it, the Eighth Circuit engaged in a fundamentally misdirected "apples and oranges" analysis when it sought to determine, as

the LECs urged, whether the FCC's interpretation of the statute would leave network elements with sufficient "disadvantages [to] preserve resale as a meaningful alternative." Pet. App. 56a. Congress created different entry vehicles to give new entrants a range of opportunities. It could not and did not prejudge which mode of entry the market would find most attractive, and certainly did not seek to load down one vehicle with "disadvantages" in order to assure that another would be frequently used.

In all events, contrary to the LECs' main argument and the Eighth Circuit's holding, it is plain that granting new entrants access to combinations of some or all network elements would *not* lead the resale vehicle to fall into disuse -- as the FCC expressly found. Pet. App. 243a-244a (¶ 331). There are several contexts in which new entrants will find resale the most appropriate entry vehicle -- such as where particularly fast or easy entry into a market is desired, where a new entrant's business plan only involves providing a small range of services, where a new entrant can offer customers lower rates by aggregating multiple customer volumes onto a LEC volume discount plan, or where customers may be being served by the incumbent LEC at subsidized rates. Thus, even before the Eighth Circuit invalidated Rule 51.315(b), although the competitive exchange services that were being offered were small in scope (as they are now still), the overwhelming majority of them were offered through resale.

Indeed, the LECs' other arguments confirm that the resale vehicle will continue to be used, for they contend that competitors will engage in "arbitrage" by using resale to serve customers who today receive subsidies. Thus, while LECs are wrong that this conduct (mislabeled "arbitrage") would harm universal service (see *infra*), the LECs' own claims contradict the argument that the FCC's network element rules would eliminate the use of resale.

Further, as the FCC found (Pet. App. 245a-246a (¶ 334)), the greater competitive opportunities available to network element purchasers are accompanied by correspondingly greater risks. The purchaser of network elements runs the risk -- unlike a reseller -- that there will be insufficient customer demand for it to recoup its costs. A reseller purchases only the services actually used by its customer, and at a discounted rate structure that mirrors the rate structure that local services customers pay. Its profit margin, if any, is thus completely predictable in advance, and not dependent on the usage patterns of its customers.

An entrant that provides service through network elements, by contrast, has no predictable margin at all. First, the loop, the network interface device and portions of the switching network element are dedicated facilities for which LECs charge a flat rate that does not vary with the customer's usage. See, *e.g.*, 47 C.F.R. § 51.509 (a,b) (Pet. App. 312a-313a).[9] Recovery of that cost, and any profit, will depend on the new entrant's stimulating the customer's usage across the range of services the elements can provide -- which itself justifies the congressional decision to give network element purchasers (like firms who construct their own facilities) more latitude than resellers to engage in joint marketing of local and long distance service. See § 271(e)(1). In this regard, the LECs' assertion (Bell Atl. Br. 62) that these flat-rated elements need not actually be purchased by the new entrant until "a customer switches providers" is true but irrelevant. The costs -- like the costs of the additional internal systems that will have to be developed in order to provide exchange access services -- will still need to be recovered, and there is no guarantee they will be.

---

[9] These FCC pricing rules were vacated by the Eighth Circuit on jurisdictional grounds, but the subsequent State rules do not differ from the FCC rules on this point.

The differences between the costs and risks of resale of LEC retail service and use of combinations of network elements is dramatically illustrated by the increasingly commonplace phenomenon of customers using on-line services (like America Online) or accessing the Internet. They do so by placing local telephone calls for which there is no additional usage or other charge, but which are included in the flat monthly service charge. If a new entrant provides service to heavy users of these services through resale of LEC services, the new entrant incurs no additional charge. By contrast, if a new entrant uses network elements, it incurs additional switching and other charges for each minute of usage -- and many customers spend scores of hours each month "surfing the Web."

Thus, in contrast to resellers of LECs' retail services, a network element purchaser can never avoid the fact that its profit or loss depends on customer usage volumes and usage patterns. Indeed, that was precisely the point made by AT&T's President in the remarks that the LEC briefs mischaracterize. See Bell Atl. Br. 52; GTE Br. 21; Ameritech Br. 24, 28. He did not say that network elements enable new entrants to obtain the "same services" at a higher "effective discount." Ameritech Br. 28. To the contrary, he stated that AT&T's "cost of goods sold" by purchasing network elements is "slightly above" the cost of purchasing services for resale, but that, *assuming* long distance usage by the customer of at least $25 a month, that added cost could be offset by revenues that AT&T could obtain by using the facilities to provide exchange access services. J.A. 257-58. In other words, he noted that by assuming a certain risk that resellers do not assume, and incurring additional cost, AT&T might reap greater rewards through purchasing network elements than through resale -- the very point made by the FCC that the LECs refuse to acknowledge.

Indeed, AT&T's President significantly understated the added costs and risks that AT&T would incur as a purchaser of

network elements, for he addressed only the payments to LECs. By contrast, he did not discuss the separate payments that purchasers of network elements will have to make to support universal service (which will be made not to LECs, but to administrators of the new funds that will collect and distribute the new explicit subsidies). In this regard, because the current wholesale rates for resale reflect all subsidies that now exist and because the cost-based rates for network elements do not, any comparisons between the two sets of rates and the resulting differences in risks would be meaningless even if it were the case -- as it is not -- that cost-based rates for combinations of network elements often or even always could somehow be said to be more favorable than those for resale.

In short, it is not the case that network element competitors obtain "guaranteed profits," avoid "incurring any of the ongoing costs associated with maintaining a real telecommunications network (costs related to such obligations as testing and repairing facilities and maintaining network records)," or avoid "undertaking any business risk." Bell Atl. Br. 52. To the contrary, the costs of maintaining, testing, and repairing facilities are part of the "cost . . . of providing" the network element that are reflected in the prices paid by new entrants (§ 252(d)(1)), and users of combinations of network elements (like owners of facilities) incur costs and risks that resellers of retail services do not.

2. Allowing New Entrants To Use Combinations of Network Elements On Nondiscriminatory Terms Poses No Threat To Universal Service.

The LECs also defend their efforts to make combinations of network elements too costly or infeasible to use on the ground that such measures are necessary to protect "universal service." The costs of providing telephone service to some customers,

particularly those in rural areas, are higher than the costs of providing service to others, and the LECs have long claimed that they need to charge supracompetitive rates to those other customers in order to subsidize the provision of service at affordable rates to the rural and other high-cost customers. This claim has played a role throughout the industry's history in every debate over regulatory efforts to foster competitive entry into monopoly markets, for the LECs have consistently opposed such efforts on the ground that any such entry would allegedly disrupt this putative subsidy system and thus threaten universal service -- a generic claim that has consistently been disproved each time entry has then occurred.[10]

Here, the claim is particularly meritless. The very purpose of the competition that the 1996 Act authorized is to assure that firms compete solely on the basis of the costs and value of their services, so § 254 of the Act eliminates the very subsidy system that the LECs are trying to invoke to prevent competition on the merits. In light of § 254, the downward pressure that new entrants will be able to place on LEC rates through competition cannot threaten universal service, and will instead bring about the very benefits for consumers the Act was enacted to produce.

Nonetheless, the LECs claim that permitting access to network element combinations on the same terms as the LECs enjoy will produce "regulatory arbitrage" that will harm universal service by allowing new entrants to "avoid contributing to the universal service subsidies." U S WEST Br. 17. In particular, the LECs claim that new entrants will then provide service at competitive and cost-based rates to the

---

[10] For example, the former Bell System repeatedly contended that competition in the long distance industry would destroy the subsidies that support universal service (as it obviously has not). *See, e.g.*, "An Unusual Obligation," Address by John DeButts, Chairman of the Board of AT&T, to NARUC Annual Convention (Sept. 30, 1973), quoted in full in *Southern Pac. Com. Co.* v. *American Tel. & Tel. Co.*, 556 F. Supp. 825, 894-902 (D.D.C. 1983).

"subsidizing" customers -- *i.e.*, those customers whom the LECs currently charge supracompetitive rates -- and thereby strip the LECs of their source of subsidy for the "subsidized" customers. Accordingly, despite the statutory ban on discrimination, the LECs claim that Congress intended both to preclude new entrants from obtaining access to combinations of network elements at the same economic cost and other terms as the LECs enjoy and to authorize LECs to impose artificial costs and service disruptions only on users of network elements. For that would, the LECs reason, force entities to provide service solely as resellers of LEC services and to pay the wholesale rates that are based on supracompetitive retail rates that allegedly are needed to support universal service.

This claim is a sham. First, it is contradicted by the LECs' startling assertions that the Congress that passed the 1996 Act decreed that local telephone networks are no longer natural monopolies and expected broadbased competitors with their own networks to develop quickly. U S WEST Br. 2-3. That is implausible, to say the least.[11] If it were so, however, it would simply demonstrate that Congress did not craft § 251, or any other portion of the Act, to protect the LECs' alleged inter-service subsidy system. Under the LECs' view, the facilities-based competitors that Congress "expected" would present precisely the same alleged "threat" to universal service as network-element-based competitors, but there would be no means of imposing artificial costs on them that would force them to become resellers. Indeed, the hypothetical new facilities-based competitors would, if anything, have a greater ability than a user of network elements to offer rates based on

---

[11] It would have been an extraordinary and ill-founded assumption, and the snippets from Committee reports and the floor statements the LECs cite for this proposition hardly reveal what Congress "expected" (U S WEST Br. 8 & n.4). The LECs are making the preposterous assertion that Congress could repeal the laws of economics.

the costs of providing service and to compete successfully with the LECs for the business of those customers the LECs presently overcharge. This underscores that the LECs' real quarrel is with the Act's requirements that network elements be available at their economic cost.

In all events, the LECs' claim is baseless with respect to either category of competitor. Section 254 invalidates the very system of inter-service subsidies that the LECs are purportedly seeking to protect. Specifically, § 254 requires that any implicit subsidies (*i.e.*, those embedded in the LECs' existing retail or other rates) are to be replaced by a new, explicit and separate government-administered "universal service fund." See Report and Order, *Federal-State Joint Board on Universal Service*, 12 F.C.C.R. 8776 (1997) ("*Universal Service Order*").

There are four separate aspects of this new regime that each refute the LECs' arguments. *First*, the LECs' repeated assertions that purchasers of network elements will "contribute nothing to universal service" are false. Compare GTE Br. 11, 21, 51; Bell Atl. Br. 51; U S WEST Br. 17. Network element purchasers will incur the same proportionate expenses of funding universal service as LECs (*Universal Service Order*, 12 F.C.C.R. at 9173-9179). They thus will contribute their "fair share" and have no unfair pricing advantage over the LECs. *Second*, when the LEC (and also any purchaser of network elements) provides service to rural or other customers at the "affordable" below-cost rates that are prescribed to protect universal service, the LEC or other carrier will be paid the full amount of the subsidy from the government administrated universal service fund. *See Universal Service Order*, 12 F.C.C.R. at 8861-70. Network element competition thus cannot threaten universal service by depriving LECs (or others) of sufficient source of subsidy.

Third, because the LECs' supracompetitive rates today far exceed what is necessary to recover their costs, to earn a reasonable profit, and to fund universal service, the competition from users of combinations of network elements will patently benefit consumers. Unlike resellers, users of network elements will not have their cost structure based on the LECs' rates and will be able to place substantial downward pressure on excessive rates. That cannot harm universal service, but that will help achieve the precise competitive benefits the Act was enacted to create: lower, competitive prices for consumers.[12] *Fourth*, if it were feasible, there would be nothing wrong with new entrants competing with the LECs by serving all customers whom LECs serve at below-cost rates through resale and serving all other customers through network elements. *Compare* Bell Atl. Br. 62-63. Because the new entrant would make universal service contributions to the fund when it used network elements and because the LEC would receive universal service subsidies from the fund when it served the below-cost customer, there would be no threat to universal service and also no advantage for the new entrant.

Ultimately, therefore, the LECs' entire argument is reduced to an alleged concern about the timing of § 254's implementation. While Congress sought to foster the most rapid possible implementation of interconnection arrangements under §§ 251-

---

[12] The LECs incongruously rely on a statement in the House report that the resale rate "should reflect whether, and to what extent, the local dialtone service is subsidized by other services . . . or subsidized through explicit subsidies from a universal service fund." *See, e.g.*, Bell Atl. Br. 50 (citing H.R. Rep. No. 104-204, at 72 (1995)). However, the most this could establish is that, when a particular local service is subsidized, the resale rate for those customers must be based on the LECs' retail rate, for competition through resale would otherwise not be economically possible. By contrast, the House Report patently did not say or even imply that competitors should be able to compete for the business of the customers who do the *subsidizing* -- *i.e.*, those who presently pay rates that far exceed costs -- only through the resale under § 251(c)(4) that would protect the LECs' monopoly profits.

52, the Act did not require the FCC simultaneously to establish and implement all elements of the new universal service system, and the FCC maintained the existing support mechanisms for an interim period. In particular, some of those mechanisms will be maintained until January 1, 1999, at which time providers of interstate services will begin making the competitively neutral universal service payments. See *Universal Service Order*, 12 F.C.C.R. at 8889, 8927. Similarly, while States are permitted to require all carriers to make interim or permanent payments based on their revenues from intrastate services (*id.* at 8888-8889), neither the Act nor the FCC's current rules compel the States to establish any particular schedule. For this latter reason, the LECs claim that the absence of a fully implemented replacement universal service system could theoretically "persist indefinitely," and that § 251(c)(3) should be interpreted to preserve the pre-existing subsidy structure for funding universal service indefinitely. Bell Atl. Br. 49.

That is absurd. Congress evidently recognized what the FCC subsequently found, and what events have borne out: there is no prospect of the rapid and massive growth of local competition through network elements that would be required to place any pressure on universal service during that short interim period. See *Access Charge Reform*, 12 F.C.C.R. 10175, 10184 (1997). More fundamentally, even in the unlikely event that this finding proved incorrect, the FCC and the States could then provide adequate interim remedies. Yet the LECs' theory rests on the nonsensical assumption that the States who have historically protected universal service would then stand idle and permit "massive [upward] pressure on the rates of [rural and residential] customers" simply because States are not *mandated* to act by a particular time. Bell Atl. Br. 50.

Even the LECs do not take this possibility seriously, for they do not propose any transition plan to deal with this contingency. Instead, they seek to use a remote theoretical possibility of a

short-term problem permanently to distort the application of § 251(c)(3) and transform it into an indefinite barrier to the only form of competition that is now feasible on a widespread basis. Beyond that, the LECs' proposed "solution" is a classic blunderbuss, for the costs it would randomly add to a critical means of competitive entry are not remotely calculated to match any possible or imagined universal service shortfall. In short, the LECs' universal service claims provide no support for their proposed interpretation of § 251(c)(3). Rather, they could support, at most, the adoption of transitional measures under § 254 to protect against a highly improbable contingency.

3. If There Were A Congressional Objective To Promote Facilities-Based Competition, The FCC Rules Would Further It.

Finally, it is both misguided and ironic for the LECs to claim that artificial and discriminatory burdens must be imposed on users of combinations of network elements in order to further a claimed congressional objective of encouraging facilities-based competition. Congress plainly would have had no reason to seek to encourage the building of duplicate facilities that are not economic or that market forces and conditions otherwise would not permit. The Act evinces no such objective. Instead, it imposes separate requirements to facilitate three different modes of entry (§§ 251(c)(2-4)) while "neither explicitly nor implicitly express[ing] a preference" among them. Pet. App. 137-38a (¶ 12). The only way the LECs can argue otherwise is by stringing together trivial and out-of-context snippets of legislative history. See, *e.g.*, U S WEST Br. 8 n.4.

In all events, new entrants do not need incentives to choose their own facilities over the LECs'. No new entrant wants to be dependent on its dominant competitor, to have such diminished control over its own operations, and to assume all the litigation

and monitoring costs such a relationship entails. New entrants will therefore obtain their own network facilities wherever and to whatever extent they are economically and technologically feasible under actual market conditions -- and AT&T, MCI, and others are actively engaged in these very efforts.

Further, the LECs' position would not accelerate, but would undermine, the development of alternative networks, for allowing unrestricted use of combinations of network elements on the same terms as the LECs enjoy is an essential bridge to that outcome. In particular, it is only through purchasing and actually using network elements that the new entrant can determine the cost and usage volume of each component, obtain information (through its provision of originating and terminating access) concerning the volume of calls that are not only made by its customers but also received by them, and establish whether and when it is economical to substitute facilities of its own for the LEC's. The reseller, by contrast, obtains information only about the customer's outgoing long-distance calls, and virtually no information about its local usage or its incoming long-distance calls, and will have thus have much greater difficulty transitioning to using its own facilities. In short, whatever the sincerity of the LECs' new-found enthusiasm for facilities-based local competition, it affords no basis for their efforts to cripple § 251(c)(3).

B. The LECs' Specific Statutory Claims Are Meritless.

Against this background, it is scarcely surprising that the terms of the Act squarely authorized the FCC to adopt rules that allow firms to obtain and use combinations of network elements on the same terms as the LEC enjoys. There is simply no textual or other basis for any of the LECs' attempts to cripple this mode of competitive entry.

1. The LECs' Arguments For Invalidating Rule 51.315(b) Are Meritless.

First, there is no substance to the LECs' attempts to defend the Eighth Circuit's decision to invalidate Rule 51.315(b). As explained in our opening brief (p. 38), § 251(c)(3)'s requirement that LECs provide access to "network *elements*" (in the plural) at any "technically feasible *point*" (in the singular) clearly establishes that new entrants can obtain access to network elements in combination. The Eighth Circuit not only disregarded this language, but rested its decision on a definition of "unbundled" that is foreclosed by the uniform dictionary, regulatory, and judicial definitions of the term. *Id.* at 38-42.

None of the LECs makes any serious attempt to reconcile the Eighth Circuit's holding with § 251(c)(3)'s use of the singular and the plural.[13] Nor do they cite a single instance in which anyone has adopted the Eighth Circuit's definition of the term "unbundled." GTE states (p. 67) that "even in the antitrust and related contexts" which petitioners cited, "unbundling" meant "requiring a firm to provide goods on a separated basis." But that is true only in a sense that sharply distinguishes it from the result the LECs seek here: firms were required to "separate[]" goods only when the customer so requested. As the decisions cited in petitioners' opening briefs establish, "unbundling," there

---

[13] The only LEC brief that even addresses this language is Bell Atlantic's, and it tries to brush it aside in a footnote (p. 58 n.31). It states that a new entrant could somehow receive access to all physically separated elements in a single collocation cage in the LEC's central office. That is both wrong and irrelevant. It is wrong because not all the elements are even located in the central office; the network interface device, for example, is located at the customer's premises. J.A. 72, 75-76 (¶ 380, 392). It is irrelevant because, even if all the elements could somehow be made available in one *place*, as long as they are separated from one another the new entrant will still obtain access to them at multiple *points* rather than at a single point.

as here, meant giving the customer that option, not ripping combinations apart against its will in order to raise its costs.[14]

The principal focus of the LECs' argument is the second sentence of § 251(c)(3). As we demonstrated in our opening brief, it was plainly reasonable for the FCC to conclude that a LEC would violate the first sentence's command that network elements be provided through "nondiscriminatory access" and on "nondiscriminatory" "terms" if the LEC separated elements that it accessed for itself in combined form -- because then the new entrant would incur costs to provide service "that incumbent LECs would not incur" to provide the same service. AT&T Br. 36 (citing *Local Competition*, 12 F.C.C.R. 12460, 12486, ¶ 44 (1997)). The duty imposed on LECs by the second sentence is an additional obligation that applies in those circumstances in which they may lawfully separate elements, either because they are requested to do so by the new entrant or because they separate the elements when they access the elements themselves. LECs are here obliged to provide the elements "in a manner that allows requesting carriers to combine [them]." *Id.*, at 43-46.

The LECs contend, however, that the second sentence establishes not an additional duty, but a limitation on the nondiscrimination duty imposed by the first sentence. *See* Bell Atl. Br. 55-56; GTE Br. 70. But the only way they can make that argument is by rewriting the statute. Bell Atlantic thus describes § 251(c)(3) as saying "in no uncertain terms" that

---

[14] For the same reason, the LECs' citations (*e.g.*, U S WEST, Br. 51-52) to passages addressing how network elements could be separated if the customers so requested are obviously irrelevant to whether § 251(c)(3) permits such separation in the absence of such requests. And it is particularly odd that GTE would claim that the FCC has "repeatedly" used "unbundling" to mean "physically separate[d]," and then cite only a single FCC order that was issued after the Eighth Circuit's decision and that sought, as the FCC was then required, to apply that decision. *See* GTE Br. 68 & n.24.

LECs must provide access to network elements "*only* 'in a manner that allows requesting carriers'" to combine them (emphasis added). See also GTE Br. 66 (same). But the word "only" is Bell Atlantic's and GTE's contribution, not the statute's. And it is precisely because this word is absent from the second sentence of § 251(c)(3) that it can only naturally be read to impose an additional obligation and not to limit the duty imposed by the first sentence.

The LECs also claim that, even apart from the second sentence, the FCC misconstrued the nondiscrimination requirement of the first sentence when it concluded that a LEC engages in unlawful discrimination when it insists upon disconnecting elements for new entrants that the LEC accesses for itself on a combined basis. According to the LECs, because the LECs at some point in the past had to combine their elements to build their networks, requiring competitors to connect the network elements they purchase merely puts the LECs and their competitors on an equal footing -- with neither having an "inherent cost advantage" over the other. Bell Atl. Br. 56; U S WEST Br. 52.

This is nonsense, First, LECs are not placing their competitors on an equal footing, for any customer that signs up with a LEC competitor will experience a service outage during the period of time before elements are reconnected and thus virtually no customers will switch away from the LEC. Second, LECs are entitled to recover all the costs of furnishing network elements, so their prices for combinations of network elements can and should include the economic costs of combining them. There is thus no "cost advantage" for the new entrant when the LEC refrains from ripping the elements apart.

Third, by contrast, if the LEC disconnects the elements -- even if it were then to "back out" the costs of combining network elements from the network element price -- it creates

for itself an insurmountable and discriminatory cost advantage by imposing added costs on the new entrant that the LEC has never incurred. In this regard, it is no answer to say that the LEC at one point built its network and combined its elements so its competitor can too; that is like saying that the new entrant should build its own loops, switches, and other facilities because the LEC once did so. The whole theory of the Act is that the LECs' monopoly customer volumes create for them enormous economies of scale. Those economies are what previously made competition with the LECs impossible because the LECs' costs would always be lower than any new entrant's. Indeed, the LECs built their networks at a time when they had monopolies that were guaranteed by law, when all customers were theirs as a matter of right, and when any reasonable expenditure they made on their networks would be included in their rate base and recovered from their captive customers. Congress sought in § 251(c)(3) to overcome this otherwise dispositive obstacle to competition by requiring that those economies be "shared with entrants." Pet. App. 137a (¶ 11). But the LECs would now require new entrants, with initially only a fraction of the LECs' customers, to reproduce the LECs' prior network-building activities and to incur the labor and other costs to wire the LECs' facilities on a customer-by-customer basis in order to compete. That would impose discriminatory costs on the new entrants that would far exceed any per-customer costs the LECs either incur today to provide service to a new customer, or incurred in the past when their networks were constructed. It would further assure that no competition to their monopolies can arise.

2. The LECs' Arguments For Imposing a Facilities-Ownership Requirement Are Meritless.

Next, the LECs have cross-petitioned on a claim that the Eighth Circuit rejected: that only competitors with some local

exchange facilities of their own should be permitted to provide service through network elements under § 251(c)(3). But this claim rests only on the "policy" arguments that are refuted above. See *supra* pp. 19-33. Further, there are two additional reasons that this claim is meritless.

First, it is contrary to the statute's text. The Eighth Circuit was correct in concluding that "the plain language of Section 251(c)(3) indicates that a requesting carrier may achieve the capability to provide telecommunications services completely through access to the unbundled elements of an incumbent LEC's network." Pet. App. 55a. The Act's interconnection provision -- § 251(c)(2) -- *does* require that the competitor own or lease facilities, for it requires interconnection "for the facilities and equipment of any requesting telecommunications carrier." § 251(c)(2). By contrast, "[n]othing in [§ 251(c)(3)] requires a competing carrier to own or control some portion of a telecommunications network" (Pet. App. 55a) before being permitted to purchase network elements. Indeed, § 251(c)(3) affirmatively precludes such a requirement. In contrast to the Act's "interconnection" provision, § 251(c)(3) requires LECs to provide network elements to "*any* requesting telecommunications carrier," not just to carriers that have already obtained local exchange facilities. (emphasis added) Further, the Act defines "telecommunications carrier" as "any provider of telecommunications services" (§ 153(44)), and in turn defines "telecommunications services" as "the offering of telecommunications for a fee directly to the public . . . *regardless* of the facilities used." § 153(46) (emphasis added). The right to purchase network elements thus extends to all competitors irrespective of whether they provide service through their own facilities or the LEC's facilities.

The LECs ignore this language, and rely instead on § 251(c)(3)'s requirement that access to network elements be provided "at any technically feasible point." *See, e.g.*, Bell Atl.

Br. 58. Their argument is that if a competitor does not have some local exchange facilities of its own, there is no "point" at which it accesses the LEC's network elements.

That claim is baseless, for new entrants without routing and transmission facilities still use "technically feasible point[s]" of access to employ the LEC's network elements. In particular, such new entrants interconnect and obtain access through the LEC's operations support systems ("OSS"). These are the systems that control the ordering, provisioning, operations and maintenance of the other network elements, and all carriers that use LEC network elements, including carriers that provide service exclusively through LEC network elements, need to access the LEC's OSS in order to use its other network elements. J.A. 116-18 (¶ 516-518). The FCC has therefore directed that BOCs, and all LECs, must provide "a point of interface (or 'gateway') for the competing carrier's own internal operations support systems to interconnect with the BOC."[15]

Thus, for example, a new entrant that purchases access to the LEC's switching element to serve a customer uses that OSS interface between itself and the LEC to add or remove calling features -- such as Call Waiting or Caller ID -- to or from its customer's line by sending software instructions through electronic and physical connections to the switch. Similarly, a new entrant will use its OSS interface to perform direct electronic or automatic testing of the loop if the customer reports an outage. Indeed, because it is generally through these

---

[15] See *Ameritech Michigan Order*, 12 F.C.C.R. 20543, 20615 (1997). The LECs challenge in this case the FCC's classification of OSS as a network element. While that challenge is meritless, *see infra* pp. 44-48, it is irrelevant to the issue presented here. OSS interfaces would be a point of access to other network elements even if the OSS were not itself a network element. J.A. 117-18 (¶ 517) ("nondiscriminatory access to the functions of operations support systems" is "a 'term or condition' of unbundling other network elements under section 251(c)(3)").

interfaces that the new entrant is able to direct the operations of the network elements it accesses, the FCC has devoted particular attention to specifying in great detail what LECs must do to assure that proper access through OSS is provided.[16]

Second, as the FCC found, the LECs' proposed restriction on the purchase of network elements could not rationally be administered. If the FCC simply required new entrants to own some facility, no matter how trivial in size or scope, the requirement would be "so easy to meet it would ultimately be meaningless." Pet. App. 248a (¶ 339). On the other hand, if the FCC required a specific level of investment in particular facilities, the statute would provide no guidance on what that level should be. And any such requirement, in addition to being inherently arbitrary, would have the additional adverse effect of "creating incentives to build inefficient network architectures that respond not to marketplace factors, but to regulation." *Id.* The LECs do not attempt to refute, much less acknowledge, this ground for the FCC's decision.

---

[16] *See, e.g., Ameritech Michigan Order*, 12 F.C.C.R. at 20617-18:

> A BOC also is obligated to provide competing carriers with the specifications necessary to instruct competing carriers on how to modify or design their systems in a manner that will enable them to communicate with the BOC's legacy systems and any interfaces utilized by the BOC for such access. The BOC must provide competing carriers with all of the information necessary to format and process their electronic requests so that these requests flow through the interfaces, the transmission links, and into the legacy systems as quickly and efficiently as possible. In addition, the BOC must disclose to competing carriers any internal "business rules," including information concerning the ordering codes that a BOC uses that competing carriers need to place orders through the system efficiently. Finally, the BOC must ensure that its operations support systems are designed to accommodate both current demand and projected demand of competing carriers for access to OSS functions.

Indeed, the difficulties of administering the LECs' proposed extrastatutory restriction is illustrated by the LECs' own conduct. For example, contrary to the LECs' claims, AT&T's entry strategy does not involve purchasing from the LECs "*all* the network elements needed to replicate [the LEC's] service." Bell Atl. Br. 52. While AT&T's entry plans vary in different areas of the country depending on market and other conditions, at a minimum AT&T would use its own operator service facilities in combination with LEC network elements, rather than purchasing access to that element from the LECs, for AT&T believes it can thereby provide more competitive service at higher quality and efficiency. Such an entry strategy would comport with all the LECs' arguments here, for AT&T would be contributing network facilities of its own that would interconnect with the LECs' facilities at a "technically feasible point" even under the LECs' restrictive understanding of that term. Yet the LECs have claimed that operator service facilities should not be deemed a sufficient contribution of AT&T's own facilities -- because permitting their proposed restriction to be met in that way would not sufficiently inhibit its entry. This just underscores how manipulable, unmanageable, and arbitrary the LECs' proposed restriction would be.

Beyond that, AT&T will use its own switches to serve virtually all large business customers. It is also seeking to invest more than $10 billion to obtain other local switches and transmission facilities to serve business customers and multi-dwelling units in numerous cities. It will have to make substantial investments in backoffice and other facilities to use combinations of network elements to serve the residential or other customers that it intends initially to serve through combinations of LEC network elements (and its own operator systems), and will deploy other facilities to serve these customers whenever feasible. Apart from the "policy" arguments that are refuted above, there is no statutory or other basis for deeming *any* of the foregoing investments to be

insufficient to entitle a carrier to use combinations of network elements to serve any customers. This competition could only result in the imposition of some competitive pressure on LECs' monopoly prices in the time before additional facilities are deployed.

3. The FCC Properly Designated Network Elements.

The LECs further challenge the FCC's decisions defining several individual network elements, as well as one aspect of the standard it used in making those determinations. The Eighth Circuit properly rejected each of these claims.

a. The Section 251(d)(2) Factors. Section 251(d)(2) sets forth two factors that the FCC must, "at a minimum," "consider" in "determining what network elements should be made available": (A) if the element is "proprietary," whether access to it is "necessary," and (B) if the element is not proprietary, whether the failure to provide access will "impair" a requesting carrier's "ability . . . to provide the services that it seeks to offer." § 251(d)(2). However, the LECs contend that these terms codify the "essential facilities" doctrine of the antitrust laws (Bell Atl. Br. 67; U S WEST Br. 33-34), and that the FCC acted unreasonably when it held that its application of these factors would focus on determining whether a new entrant that is denied a network element can obtain the same functionality from another element within the LEC's network, rather than examining its availability from other sources.

The FCC's application of these factors was manifestly reasonable. First, § 251(d)(2) plainly does not codify the "essential facilities" doctrine. If Congress had wished to do so, it could easily have said so (or used equivalent terms and concepts): *e.g.*, by providing that "the claimed input must be essential to the plaintiff's survival in the market." 3A Phillip E.

Areeda & Herbert Hovenkamp, *Antitrust Law* ¶ 773b, at 202 (revised ed. 1996). Instead, it defined "network element" broadly to encompass any "facility or equipment used in the provision of a telecommunications service." § 153(29). It then imposed no limits on the elements that the FCC could define, but merely directed the FCC to "consider" (1) whether the unavailability of nonproprietary facilities would "impair" any competing carrier's ability to provide a service and (2) whether availability of a "proprietary" facility would be "necessary." The FCC reasonably defined "impair" to mean that the failure to declare a LEC facility to be a network element would lower the quality or increase the costs of any competitor's service, and it reasonably defined "necessary" to mean that the element is a prerequisite to competition. J.A. 50-55 (¶¶ 282-287). The Eighth Circuit upheld these definitions, and they represent accepted meanings of these terms.

Further, § 252(d)(2) had not "forbidden" anything (compare GTE Br. 62), and the FCC patently did not violate its provisions by declining to consider whether network elements could be independently built or obtained. The economic barriers that enabled LECs to maintain their monopolies arose not because duplication of their networks is physically impossible, but rather because no new entrant has the traffic volumes that would enable it economically to duplicate the facilities that the LEC controls. That is why the Act requires LECs to share those economies with new entrants. By the same token, if new entrants could generally obtain local loops, switches, or other functionalities more efficiently from sources other than the LEC -- and there is no serious claim that they

now could[17] -- the FCC reasonably concluded that the new entrant would do so.

b. Operations Support Systems ("OSS"). OSS are the databases and associated hardware and software that the LECs use, among other things, to input orders from customers, to assign telephone numbers, to track the facilities that provide customers with service, to test and coordinate maintenance of those facilities, and to convert the recorded customer usage information into bills. They are an essential part of providing telecommunications services, and are used by LECs in filling orders placed by new entrants for network elements as well as services to be resold.

When a customer moves into a new home and calls up the incumbent LEC to order phone service, the sales representative that answers the call can access the OSS immediately to obtain the necessary information, and to program the network to provide service, through a computer terminal on his or her desk. For example, the sales representative will use that terminal to (1) verify the customer's location on the telephone network, (2) assign the customer a telephone number, (3) assign the particular facilities that will be used to provide service to that customer, and (4) program the switch in the telephone network to provide whatever special features, such as Call Waiting, the customer requests. If the customer later calls to complain of a service outage, a different representative can access OSS to conduct an automated test of the customer's line, and, if necessary, to program into the maintenance schedule a visit to the customer's home. Many of these systems are thus connected electronically to the facilities that route calls within

---

[17] For example, U S WEST states (p. 9) that switches can be easily built. But the FCC found -- and U S WEST's FCC comments did not dispute -- that the failure to provide the switch as a network element would erect a substantial "entry barrier." J.A. 85-86 (¶ 411).

the network, and allow the LEC representative to program or test those facilities with a few keystrokes. These LEC personnel can thereby confirm that service has been turned on, give the new customer a telephone number, or tell the customer when a service visit will be made, in the same telephone call in which the customer first contacts them.

When a new entrant is providing a customer with service through network elements or resale, the incumbent LEC still owns and controls access to the underlying facilities. Thus, a competitor cannot advise the customer of his or her new telephone number, commit to a schedule for providing or repairing a service, or even know which specific facilities are serving that customer until it first accesses the LEC system and obtains the necessary information. Nor can the customer receive service unless and until someone inputs the customer's order into the LEC's systems.

Before the FCC, the LECs did not deny that competitors must have access to this information and the ability to send orders and other instructions to the LEC. But they contended that they should be able to preclude competitors from connecting to the LEC systems electronically, as the LECs themselves do, and should be free to use far slower and more error-prone methods of transmission, such as facsimiles, mail, and hand-deliveries -- at which point the LECs themselves, at whatever schedule they chose, would key in the orders and requests for information to their systems. J.A. 113 (¶ 506). The FCC rejected this claim. It held that LECs must give competitors "nondiscriminatory" access to the critical information in those systems and to the ability to input instructions to the LEC facilities through those systems. If LEC sales representatives can access these systems electronically and provide immediate information to customers during the initial customer contact, competitors must have the same electronic access so that their sales representatives can provide the same information to their customers. *Id.*, ¶ 523.

If, by contrast, customers had to wait longer when dealing with competitive carriers than with LECs -- hours or days as opposed to minutes -- the LECs would have an insurmountable competitive advantage. The FCC thus concluded that the LECs' control over the essential ordering, provisioning and maintenance systems is as significant a "barrier to entry" as their control over the remainder of their networks (*id.*, ¶ 516); that nondiscriminatory access to these systems is "vital to creating opportunities for meaningful competition" (*id.*, ¶ 518); and that without such access "competing carriers will be severely disadvantaged, if not precluded altogether, from fairly competing" (*id.*). J.A. 116-18.

The FCC found that nondiscriminatory access to OSS was required on three independent grounds: (1) that the systems are within the definition of "network element" because they are "databases" or "facilit[ies] . . . used in the provision of a telecommunications service" (see § 153(29)); (2) that the systems are within the definition of "network element" because the information they contain is "information sufficient for billing and collection or used in the transmission, routing, or other provision of a telecommunications service" (*id.*); and (3) that nondiscriminatory access to these systems is necessary to the statutory requirement that LECs provide nondiscriminatory access to *other* network elements or to services for resale. *Id.*, ¶ 517. J.A. 117-18.

The LECs contend that the FCC's interpretation of the statutory term "network element" to include OSS was unreasonable under *Chevron*. Even if that were so, they would have no valid claim, for that challenges only the first two grounds for the FCC's decision. The LECs do not address, much less refute, the third independent ground on which the FCC relied, which does not depend upon whether OSS are

classified as network elements.[18] Nor would it suffice if they address the issue for the first time in their reply brief, for the only claims they raised in the Eighth Circuit and the only questions presented and discussed in their cross-petitions was whether OSS was properly defined as a "network element."

Moreover, even if the LECs' claim were not foreclosed by this independent ground, their claim is meritless. Its basis is the LECs' assertion that network elements are limited to parts of the "call-routing network" (GTE Br. 58) that facilitate "the transmission of calls" (Bell Atl. Br. 70). That assertion is wrong, and would be irrelevant even if it were right. The statutory definition rejects the notion that "network elements" are limited to call delivery and transmission. To the contrary, they include all facilities and equipment "used in the *provision* of a telecommunications *service*" (§ 153(29) (emphasis added)), and the statute defines "telecommunications service" as not only transmission but also "the *offering* of telecommunications for a fee directly to the public." § 153(46) (emphasis added). The breadth of this definition was deliberate, for Congress limited other statutory terms to "transmission" and "routing" where that was its intent.[19] Further, if the matter were not already abundantly clear, the statutory definition also expressly includes among its examples "databases" and "information sufficient for

---

[18] Indeed, that ground is irrefutable. The FCC has held, in a rule no party has ever challenged (47 C.F.R. § 51.311(b)), that "nondiscrimination" requires that the quality of access that the LEC provides to new entrants be at least equal to the quality of access the LEC provides to itself. If it takes longer for a LEC to supply access to a network element or a service to be resold, or to repair it, when it is supplied on behalf of a new entrant's customers than when it is supplied on behalf of its own customers -- as it will if the LEC does not provide nondiscriminatory access to its OSS -- then the LEC has not complied with the nondiscrimination requirement for that element or service.

[19] *E.g.*, § 153(43) (defining "telecommunications" as limited to "transmission"); § 251(c)(2) (duty to interconnect "for the transmission and routing of telephone exchange service").

billing and collection or used in the transmission, routing, or other provision of a telecommunications service." Finally, OSS would be a network element even under the LECs' proposed definition, for OSS controls the assignment, tracking, maintenance, and repair of call-routing facilities, and are certainly "part of the call-routing network." GTE Br. 58.

The LECs also assert that OSS are their "business skills" (GTE, p. 59) and are "backroom functions that any new competitor could reasonably perform for itself." US WEST, p. 37; *see id.*, p. 38 (competitors "can write or buy software as easily as the incumbent can"). But OSS are not software systems used to track marketing performance, administer pension benefits, or maintain personnel records. They are the systems used to order and repair the very facilities and services to which the LEC is required to grant access. Nothing in the FCC's *First Report and Order* relieves new entrants of the need to build their own internal hardware and software systems to serve their customers. The only issue is whether those systems and the LECs' systems will be able to converse efficiently when the new entrants need information that resides exclusively in LEC databases, and when the new entrants need to place orders or issue other instructions to the LECs.

c. Vertical Features. The LECs also challenge the FCC's holding that the "switching element includes all vertical features that the switch is capable of providing." J.A. 87 (¶ 412). That holding was likewise a straightforward application of the statute. Specifically, special calling features such as Caller ID and Call Waiting are provided to customers through the operation of hardware and software that reside within the LECs' switches, just as basic calling capabilities are provided through switch hardware and software.

No one disputes that the switch facility is a network element, and the statutory definition of network element expressly states

that an element "includes" all "features, functions and capabilities" of the pertinent facility. § 153(29). There is no material difference in this respect between the switch features, functions, and capabilities that are used to provide dialtone and call routing, for example, and the switch features, functions, and capabilities that are used to provide Caller ID and Call Waiting -- and certainly no legal basis to exclude either when the switch is provided as a "network element." All are "features," "functions," and "capabilities" of the same switch.

d. Operator Service Facilities. The LECs' next challenge Rule 51.319(g), which provides that "operator service facilities" are network elements. These facilities are clearly "network elements" under § 153(29), for they are "equipment used in the provision of a telecommunications service." Indeed, they are part of the very "call-routing network" that the LECs erroneously contend is the sole repository of network elements (*see supra* p. 47), for these facilities are used to route calls.

GTE focuses (p. 57) on the fact that, in a minority of instances (most operator services, such as calling card services, are wholly automated) these facilities will connect a caller to live operators who will use the facilities to route calls. They contend that it is an "absurdity" to make "people" part of a network element. But all network elements require live persons to operate them.

Finally, the LECs contend that these facilities, and the vertical features discussed *supra*, are a "service" and should be made available only through resale. But the Act does not remotely draw the sharp distinction between "facilities" and "services" that the LECs suggest: that is why it provides that network elements include not only "facilities" but all their "capabilities" (which includes the services they can provide) (§ 153(29)), and why the competitive checklist applicable to the BOCs requires that they offer, for example, local loop facilities "unbundled

from local switching or other *services*" (§ 271(c)(2)(B)(iv) (emphasis added); *see also* § 271(c)(2)(B)(v-vi)). And the Eighth Circuit was surely correct in upholding as reasonable the FCC's conclusion that the fact that a functionality can be labeled a "service" does not mean that it is exempt from the requirement that it be made available as a network element, for under such a holding the LECs could "entirely evade the unbundling requirement in section 251(c)(3)" by choosing to market network elements as "services" to end users. J.A. 41 (¶ 263).

III. THE FCC's "MOST FAVORED NATION" RULE IS VALID.

In their opening briefs, Petitioners demonstrated that the FCC's "Most Favored Nation" rule correctly interprets § 252(i), and is at the very least reasonable. Remarkably, not one of the Respondents so much as acknowledges, much less responds to, the textual basis for the FCC's rule -- that § 252(i) draws a clear distinction between elements "provided *under* an agreement," which must be made available to others, and the "agreement" itself. Respondents' inability to demonstrate that Congress' language unambiguously forecloses the FCC's interpretation shows that the Eighth Circuit erroneously invalidated this rule.

CONCLUSION

For the foregoing reasons, the judgments of the court of appeals (1) holding that the FCC lacks jurisdiction over pricing and other intrastate local competition matters; (2) vacating 47 C.F.R. § 51.315(b); and (3) vacating the FCC's interpretation of 47 U.S.C. § 252(i) should be reversed, and the portions of the Eighth Circuit's decision vacating various unbundling rules under the wrong standard of review (AT&T Br. 32-34) should be vacated and remanded for reconsideration. In all other respects, the judgment should be affirmed.

Respectfully submitted,

ASSOCIATION FOR LOCAL TELECOMMUNICATIONS SERVICES, *et al.*,

Petitioners,

v.

IOWA UTILITIES BOARD, *et al.*,

Respondents.

On Writs of Certiorari to the United States Court of Appeals for the Eighth Circuit

REPLY BRIEF OF THE ASSOCIATION FOR LOCAL TELECOMMUNICATIONS SERVICES, *et al.*

ARGUMENT

While the FCC's *Local Competition Order* contains many determinations that were challenged on the merits by the incumbent telephone companies at the Eighth Circuit, only two portions of that order were singled out when the incumbents requested and obtained a stay: (1) the FCC's pricing rules, and (2) the FCC's interpretation of section 252(i), which provides "most favored nation" treatment for individual portions of interconnection agreements.[1]

[1] This reply brief addresses only the Respondents' arguments (continued...)

But the importance attributed to section 252(i) by the incumbents during the stay proceedings below has disappeared from their briefs on the merits. SBC, Bell Atlantic, and BellSouth, representing five of the seven original regional Bell Operating Companies, devote only three pages to this issue at the end of their seventy-five page brief, and the other incumbents are similarly silent.[2] The Association for Local Telecommunications Services and its members joining this brief respectfully suggest that the incumbents are attempting to hide what they cannot defend.[3] Section 252(i) remains a key portion of Congress' pro-competitive scheme, and this Court should take care to uphold the FCC's implementation of this provision.

Under the familiar two-phase test of *Chevron*, a reviewing court looks first to statutory language to support an agency's interpretation, and only in the absence of that language does it turn to "the structure and language of the statute as a whole." *Chevron, U.S.A. v. NRDC*, 467 U.S. 837, 842 (1984), quoting *National R.R. Passenger Corp. v. Boston & Maine Corp.*, 503 U.S. 407, 417 (1992). The FCC's rule requiring that individual portions of interconnection

---

[1](...continued)
concerning section 252(i). ALTS supports the arguments of other petitioners concerning: (1) the FCC's jurisdiction to adopt pricing rules; (2) the FCC's definition of network elements, including Operations Support Systems; and (3) the FCC's definition of "necessary" in regards to network elements.

[2] *See* SBC Brief at 72-75; U S WEST Brief at 53-57; GTE Brief at 71-73. The issue goes unmentioned by Ameritech.

[3] ALTS is a national trade association representing facilities-based providers of competitive local telecommunications services.

agreements be made available to requesting carriers is grounded in the specific language of section 252(i):

> "A local exchange carrier shall make available *any interconnection, service, or network element* provided under an agreement approved under this section to which it is a party to any other requesting telecommunications carrier upon the same terms and conditions as those provided in the agreement." (Emphasis supplied.)

Thus, the plain language of the statute demonstrates that requesting carriers are entitled to obtain any particular network element or service provided "under the agreement," and need not accept the agreement in its totality. The Eighth Circuit's opinion, by contrast, in effect rewrites the statute to read: "A local exchange carrier shall make available any agreement approved under this section to which it is a party to any other requesting telecommunications carrier." Congress, however, did not write section 252(i) this way, and the contrast between the Eighth Circuit's version and the language Congress actually chose fully establishes that the FCC's reading passes the first phase of *Chevron*.

Among all the incumbents, only GTE responds to this fact, claiming that "While the court cast its analysis under the second step of *Chevron*, it would also have properly fit under the first. Examination of the structure and purposes of a statute is one of the 'traditional tools of statutory construction,' *Regions Hospital* v. *Shalala*, 118 S. Ct. 909, 915 (1998)" (GTE Brief at 73 n.26). This is a profound misapplication of *Chevron*. Once the Eighth Circuit found support for the FCC's rules in "the language of subsection 252(i) in isolation ..." (Pet. App. 25a), its task was completed and the rules should have been affirmed. It would effectively destroy *Chevron's* first phase if reviewing courts could disregard black letter law supporting agency action, and turn

instead to an enactment's "structure and purposes."

Unable to counter the firm grounding of the FCC's rules in the statute, the incumbents focus instead on the second phase of *Chevron*.[4] While these claims are irrelevant given the vindication of the FCC's rules under the first phase of *Chevron*, they are also unsupported by the structure of the Act and unfounded for several reasons. *First*, the incumbents portray themselves as champions of the negotiation process, and attack the FCC rules for permitting requesting carriers to substitute terms from other agreements that are different from terms that were bilaterally negotiated earlier by the requesting carrier. According to the incumbents, this extends the negotiating process impermissibly because incumbents must negotiate knowing that individual items will have to be made available to other requesting carriers. U S WEST Brief at 56; GTE Brief at 73; SBC Brief at 74.

This is advice from foxes about how to build a henhouse. As the FCC correctly observed, it is the new entrants that are injured by any resultant delay in the negotiations process, not incumbents seeking to preserve their $100 billion a year monopoly. (Pet. App. at 263a.) Only the new entrants would have standing to complain about any delay produced by the FCC's rules.

Second, the incumbents claim the rules would render interconnection agreements "not binding" because new entrants could substitute individual portions from other new entrants' interconnection agreements for the portions of their own negotiated agreements dealing with the same topic. US WEST Brief at 56-57; SBC Brief at 73. But the interpretation

---

[4] SBC never mentions *Chevron* in its section 252(i) discussion, and bases its defense of the Eighth Circuit solely upon policy arguments (SBC Brief at 72-75).

of section 252(i) being urged by the incumbents -- the substitution of an another new entrant's *entire* agreement instead of only selected portions -- would work an even greater change on existing contracts. Plainly, the incumbents cannot complain about the abrogating effect of the FCC's rules while supporting a position with even greater effect. More fundamentally, however, the incumbents' claim that negotiated contracts are rendered "not binding" by section 252(i) is simply wrong. "Most favored nations" clauses are commonly included in privately negotiated trade, procurement, and labor contracts without rendering any of these devices "not binding." Indeed, Congress has elsewhere employed statutory mechanisms for analogous purposes -- for example, the Robinson-Patman Act assures that smaller retailers obtain wholesale prices similar to those offered larger firms (15 U.S.C. § 13a). Whatever debate might exist about the wisdom of Congress' intervention in markets, such mechanisms have never been overturned on the ground that they render private contracts "not binding."[5]

Third, the requirement of the FCC's rules that individual items of interconnection agreements be provided to all requesting carriers so long as there are no appreciable differences in the underlying cost of provisioning, is neither so novel nor so dramatic as the incumbents suggest.[6] Rather,

---

[5] *United States Trust Co. v. New Jersey*, 431 U.S. 1, 15 n.23 (1977), cited by incumbents in support of their claim, holds only that it would be an "absurdity" under ordinary contract law to conclude that sovereign entities had somehow implicitly reserved a right *not* to pay contractual obligations at the same time they issued express obligations to pay.

[6] *See* SBC Brief at 73: " ... this bizarre rule;" U S WEST Brief at

(continued...)

it is simply the general non-discrimination obligation that has been applied to the incumbents' regulated services for more than a century, now extended to the contractual interconnection arrangements whereby incumbents supply wholesale services to new entrants. 47 U.S.C. § 202(a). Because these contracts typically contain multiple services and network elements, the disaggregated "most favored nations" right created by section 252(i) is an appropriate and necessary mechanism to insure non-discrimination in the incumbents' provisioning of wholesale services.

CONCLUSION

For the foregoing reasons, the FCC's rules implementing section 252(i) of the Telecommunications Act of 1996 should be upheld.

Respectfully submitted,

Testimony of E. Beard for Bell Atlantic-Maryland, Inc., MD PSC Case No. 8731-II, (Jan. 10, 1997) 9

INTRODUCTION AND SUMMARY OF ARGUMENT

Respondents and cross-petitioners impermissibly ask this Court to recreate national telecommunications policy *de novo*. Avoiding any serious analysis of the statutory text and ignoring the compelling factual and policy findings of the Federal Communications Commission ("FCC"), the incumbent local carriers (joined by the state commissions only on the jurisdictional issue) demand a series of judicially imposed restrictions that appear nowhere in the Telecommunications Act of 1996 (the "1996 Act" or "Act"), and serve only to protect their entrenched interests. It is hardly surprising that the incumbent carriers would seek to derail efforts to end their longstanding monopolies, or that state utility commissions would be unhappy about Congress' decision to limit their prior authority to prescribe the substantive law governing competition in intrastate markets. But this case is not about whether Congress or the FCC made the best policy choices. The issue here is whether Congress foreclosed the FCC from implementing the 1996 Act in the way that the FCC has. *See Regions Hosp. v. Shalala*, 118 S. Ct. 909, 915-16 (1998). On that question, respondents and cross-petitioners are virtually silent.

The incumbent carriers' attempt to replace the statutory text and the FCC's expert policy judgments with their own policy preferences is most transparent in their attacks on the FCC rules implementing § 251(c)(3), the provision requiring incumbents to lease unbundled elements of the local network. Those attacks rest on the premise that entry into local markets through the use of unbundled elements should be discouraged because such entry would threaten the existing scheme of implicit universal service subsidies and create disincentives to pure facilities-based competition. For these reasons, the incumbents demand four specific restrictions: (i) no leasing of existing combinations of network elements; (ii) no leasing of *any* network elements unless a new entrant already has facilities of its own; (iii) no leasing of critical features, functions and capabilities of the network; and

(iv) no leasing of network elements that are theoretically "available" from a source other than the incumbent.

The Act, however, does not suggest, much less impose, the restrictions the incumbents demand. Had Congress wanted to impose them, it could easily have done so in plain English. There is no reason to think that Congress wanted to preserve the status quo of monopoly service and implicit subsidies until some distant future time when (or if) competing ubiquitous physical networks have been built. To the contrary, Congress wanted to ignite competition as "quickly as possible," [1] and (as even the incumbents' own lawyers have acknowledged) legislated an end to the insupportable scheme of hidden subsidies that was the sole remaining justification for shielding the incumbent carriers from competition. *See* P. Huber, M. Kellogg & J. Thorne, *The Telecommunications Act of 1996*, at 55 (1996) (praising the Act's "long overdue" reform of "the universal service guarantee [that] has evolved into a rat's nest of implicit subsidies and accounting sleight-of-hands utterly unsuited to a competitive marketplace"). Nor did Congress view the prospect of the immediate reduction of implicit subsidies as a threat requiring remedial statutory impediments. Instead, in § 254 of the Act, Congress mandated explicit, competitively neutral regulatory mechanisms that would fund universal service in ways that did not impede the rapid emergence of competition. Thus, there is simply no basis for concluding that Congress foreclosed the FCC from implementing the 1996 Act's unbundling requirements in a manner that would jumpstart local competition.

Respondents' efforts to deny the FCC any authority to implement the Act's pricing requirements are likewise an attempt to rewrite the statutory text in the service of policy preferences that Congress nowhere articulated. The statutory text unambiguously gives the FCC authority to implement all requirements of the 1996 Act. Section

---

[1] H.R. Rep. No. 104-204 at 89 (1995) ("H. Rep.").

251(d)(1) of the 1996 Act authorizes the FCC to implement the requirements of § 251, including the substantive requirement that rates be "just, reasonable, and nondiscriminatory." Section 201(b) of the Communications Act grants the FCC authority to implement all provisions of the Act—including §§ 251 and 252. Thus, the FCC would lack authority to issue pricing regulations only if other statutory language clearly restricted these plenary grants of authority. None does.

Respondents' arguments ultimately rest on the incorrect theory that the 1996 Congress wanted to maintain the division of regulatory authority previously established by the 1934 Communications Act. That argument ignores reality. The 1996 Act dramatically changed the prior regulatory regime in which federal law governed interstate matters and state law governed intrastate matters. Congress expressly preempted state laws that restricted competitive entry into local markets (§ 253), and supplanted state laws governing intrastate carrier-to-carrier relations with federal requirements designed to foster local competition (§§ 251(c) and 252(d))—including, specifically, requirements governing the prices incumbents could charge new entrants for use of the existing network. Congress made clear that the FCC, in "implementing and enforcing" these new substantive requirements, could preempt state laws that were inconsistent with them or that hindered achievement of their purposes. § 251(d)(3). Congress also denied state courts any power to review state commission decisions under § 252 of the Act, and mandated federal court review of those decisions. § 252(e)(4), (6). Thus, it is simply not plausible to argue that the FCC was guilty of "breaching a 60-year old statutory barrier that Congress had purposely left in place" when it passed the 1996 Act. Brief of Bell Atlantic Corporation, et al. (hereinafter "BA") at 2. Congress—not the FCC—breached that barrier.

Respondents' reliance on § 2(b) of the 1934 Act does not advance their case. The issue here is quite different than the one they pose; it involves the respective roles of

the FCC and state utility commissions in implementing *federal* law. In particular, the issue is whether as a result of § 2(b), after Congress has already prescribed law governing intrastate matters and granted the FCC general implementing authority, Congress must go further and specify expressly that the FCC's rulemaking authority extends to all of the particular intrastate matters indisputably governed by federal substantive law. Section 2(b) does not impose such a requirement. Instead, the requirements of § 2(b) are met when Congress indicates its intent in a "straightforward" and "unambiguous" manner. *Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355, 377 (1986). There is no basis for respondents' attempts to read § 2(b) as imposing an additional rule that Congress make its intent "express." Just as Congress made clear (though not express) that the local competition provisions *apply* to intrastate matters, Congress plainly intended the FCC to have jurisdiction to implement those provisions. Moreover, in *Louisiana*, the Court relied on § 2(b) to deny the FCC the authority to exercise *ancillary* jurisdiction to regulate beyond where Congress had legislated. The case does not hold that even where Congress has enacted federal requirements to govern intrastate matters, the FCC lacks authority to implement those federal requirements absent an additional, and express, grant of specific authority to regulate.

ARGUMENT

I. THE INCUMBENTS' CHALLENGES TO THE FCC'S "UNBUNDLING" REGULATIONS ARE WITHOUT MERIT.

The incumbents devote most of their briefs to arguments designed to disable § 251(c)(3). The gist of their case is that the statutory language Congress employed in § 251(c)(3) (which sets forth the leasing obligation) and § 153(29) (which defines "network elements"), if given its ordinary meaning, would make it too easy for new entrants immediately to begin offering competitive service—and compete away monopoly profits—by leasing unbundled elements. They argue that Congress instead

intended to establish only two avenues to enter the local market—either undertaking the staggeringly expensive task of building a duplicative local network (which might bring about real competition in the distant future), or following the far easier route of reselling the incumbents' existing services (which does not threaten incumbents in any serious way). The right to lease unbundled elements was, in their view, merely a means by which new entrants could temporarily obtain discrete pieces to fill in gaps as they struggled through the long, slow process of building their own networks. The FCC's decision to give the text of § 251(c)(3) its ordinary meaning, thereby making leasing unbundled elements a robust entry strategy, the incumbents argue, was a grave error because it allowed for *real* competition—which would drive retail rates to cost—in the short term. According to the incumbents, the 1996 Act contemplates a much slower transition to competition, thus preserving for the indefinite future the current system of rate averages and implicit subsidies. Until new entrants have their own networks, the incumbents contend that they should be able to compete only by using the Act's resale option, which does not threaten the existing rate structure.

This central theme animates each of the incumbents' challenges to the FCC rules implementing § 251(c)(3). First, the incumbents defend the Eighth Circuit's invalidation of Rule 315(b) on the ground that new entrants must be made to bear the senseless and discriminatory cost of reconnecting the elements needlessly ripped apart by the incumbents, because otherwise leasing network elements might become an economically feasible means of competing away the incumbents' supracompetitive profits. Second, the incumbents attack the Eighth Circuit's affirmance of the FCC's decision that new entrants may lease network elements even if they do not yet have any of their own facilities, again arguing that new entrants will be able to erode too quickly the incumbents' monopoly profits. Third, the incumbents argue that the FCC made too much of the network avaliable for lease.

Finally, the incumbents assert that the FCC made it too easy for new entrants by allowing them to lease particular unbundled elements of the existing network even when those elements might be available (at a higher price) from another source. These particular complaints form the substance of incumbents' rhetorical claims that the FCC has authorized "sham unbundling" and read resale out of the Act.

Although the incumbents colorfully describe the FCC's rules as a "wrecking ball" demolishing carefully crafted statutory restrictions on the Act's leasing provisions, the truth is that the statutory text contains no such restrictions. That is critical, for (though the incumbents never mention it) the FCC's interpretation of § 251(c)(3) and § 153(29) is subject to judicial invalidation only if (i) Congress has spoken to " 'the precise question at issue' " and foreclosed the agency's interpretation, or (ii) that interpretation is arbitrary and capricious or otherwise unreasonable. *Regions Hosp.*, 118 S. Ct. at 915 (quoting *Chevron U.S.A. Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837, 842 (1984)). In evaluating the FCC's unbundling rules, judicial deference is particularly warranted, both because Congress directly delegated to the FCC the task of implementing the Act's unbundling requirements, *see United States v. O'Hagan*, 117 S. Ct. 2199, 2217 (1997), and because these issues involve a "complex and highly technical regulatory program" and "necessarily require significant expertise and entail the exercise of judgment grounded in policy concerns." *Thomas Jefferson Univ. v. Shalala*, 512 U.S. 504, 512 (1994) (quotation omitted). Indeed, deference should be at its zenith because (as will be shown) the incumbents' unbundling arguments ultimately rest on disagreements with the FCC's findings and predictive judgment about how market participants will behave. *See FCC v. National Citizens Comm. for Broad.*, 436 U.S. 775, 813 (1978) (deference especially appropriate for findings "of a judgmental or predictive nature").

With respect to each of the incumbents' challenges to the FCC's unbundling rules, there is no plausible argument that the statutory text unambiguously forecloses the FCC's interpretation. Nor have the incumbents shown that the FCC's rules are arbitrary or capricious, or otherwise unreasonable. In the rulemaking process, the incumbents vigorously pressed their demands for delaying local competition, preserving implicit subsidies, and creating artificial incentives for competitors to construct competing networks by burdening other possible entry strategies. But the FCC chose to implement the Act's unbundling requirements so as to jumpstart local competition. The FCC did so only after making appropriately detailed findings that its rules would not "read resale out of the Act" or otherwise threaten the legitimate interests of the incumbents. The FCC was not insensitive to the incumbents' policy pleas. But it made clear that the preservation of universal service would be accomplished as Congress intended—through the explicit, competitively neutral mechanisms mandated by § 254 of the Act—and not by subverting the goal of immediate competition in local markets. The 1996 Act did not deny the FCC that policy choice, and reviewing courts are not in a position to second-guess it.

A. The Incumbents Have Not Demonstrated That the Text of § 251(c)(3) Unambiguously Forecloses the FCC's Decision to Impose Rule 315(b), Or That the Rule Is Arbitrary And Capricious Or Otherwise Unreasonable.

The incumbents make only a half-hearted effort to defend the Eighth Circuit's invalidation of Rule 315(b). They do not take issue with most of what was said in petitioners' opening briefs. They do not even mention (much less try to satisfy) the governing legal standard set forth in *Chevron*. Nor do they even acknowledge the FCC's detailed findings made in support of Rule 315(b).

The best the incumbents can do by way of textual analysis is to argue that the FCC's interpretation of § 251(c)(3) is not the only possible reading. More

specifically, they assert that the statutory term "unbundle" in the first sentence of § 251(c)(3) can mean "physically separated," and that "separately priced" is therefore not "the only reasonable" interpretation of the term. BA 54. That hardly suffices. Under *Chevron*, an agency has the discretion to adopt *any* reasonable interpretation of a term, and past agency usage and multiple dictionary definitions are powerful indications that the agency's construction is reasonable.[2]

To buttress their argument that "physically separated" is the better reading, the incumbents argue that the requirement in the second sentence of § 251(c)(3) that incumbents "shall provide such unbundled network elements in a manner that allows requesting carriers to combine such elements," must be read as authorizing the lease of individual elements *only* in a physically separated form. But that is not what the statute says. The incumbents read into § 251(c)(3) the qualifier "only," a word that does not appear in the text.[3] The FCC reasonably read the second sentence of § 251(c)(3) to mean that *when* a competitor wishes to combine elements on its own in order to reconfigure the elements, the incumbent must allow the competitor to do so. It does not follow that elements which are already combined must be ripped apart for no valid economic reason. The incumbents' different construction of § 251(c)(3) "is not an inevitable one," *Regions Hosp.*, 118 S. Ct. at

---

[2] Elements that can be unbundled for use by a lessor at a separate price typically—though not inevitably—*can* be made available as physically separate items. It is therefore hardly surprising that the FCC on occasion has discussed the mechanics of separating elements that are to be unbundled.

[3] *See* BA 53 ("the 1996 Act says in no uncertain terms that incumbents need *only* provide 'access to network elements on an unbundled basis' and *only* in a 'manner that allows requesting cariers to combine such elements' ") (emphasis added); GTE 66 (section 251(c)(3) "concludes by specifying that incumbents are required to provide elements *only* 'in a manner that allows requesting carriers to combine such elements' ") (emphasis added).

916-17, and does not provide a basis for invalidating Rule 315(b).

Nor have the incumbents dealt with the conflict between their definition of "unbundled" and the nondiscrimination requirement of § 251(c)(3). The incumbents contend that it is not discriminatory to force new entrants to bear the cost of reconnecting elements the incumbent has ripped apart, because the incumbents did not "stumble[] on their networks already constructed and combined." U S West 52; *see also* BA 56. In other words, they argue that by being forced to put the network back together, a competitor is doing no more than what the incumbent had to do when it initially constructed the network. But that is to ignore the economies of scale that alone made it possible for the incumbents to construct their extensive networks—economies that the leasing provisions allow new entrants to share. In any event, as the incumbents know, when a competitor leases a network element, the cost of connecting that element to the rest of the telephone network has already been built into the lease price of that element.[4] As a result, when a competitor is forced to reconnect network elements the incumbent has ripped apart, it is paying twice, while the incumbent has paid only once (and has already been fully reimbursed for the competitor's share of that cost). Moreover, competitors' customers suffer a loss of service during the reconnection process, while the identically situated Bell Atlantic customer does not. That is the very definition of discrimination, prohibited by the plain terms of § 251(c)(3).

Because the text does not help them, the incumbents resort to the argument that the Court of Appeals' deci-

---

[4] For example, as Bell Atlantic testified in Maryland at the proceeding through which element prices were set, included as part of the element price of the wire loop that connects the residence to the switch is a "central office termination cost," which represents the cost of connecting the loop to the switch at the central office. Testimony of E. Beard for Bell Atlantic-Maryland, Inc., MD PSC Case No. 8731-II at 5 (Jan. 10, 1997).

sion was appropriate because it "provides a bulwark against the total elimination of Congress' distinction between unbundled elements and resale." U S West 48; *see also* GTE 50. As we demonstrate below, however, there simply is no basis for the incumbents' predictions that the FCC's rules will eliminate the distinction between unbundled elements and resale. *See infra* pp. 14-16. In any event, that concern cannot possibly justify the Eighth Circuit's hopelessly overbroad "bulwark." Rule 315(b) applies to a competitor's request to lease *any* two elements in combination, not only to a request by a competitor with no facilities of its own to lease all of the network elements necessary to provide service, the so-called "platform" of elements the incumbents wrongly assert is the functional equivalent of resale. The invalidation of Rule 315(b) is thus a grossly overbroad response to the policy concern the incumbents have raised. Knocking out every existing combination of network elements merely to prevent new entrants from relying *entirely* on leased elements has enormously harmful marketplace consequences. MCI, for example, has invested nearly two billion dollars in local facilities, and had intended to offer its own new services through its own facilities and facilities leased in combination from the incumbents. The Eighth Circuit's invalidation of Rule 315(b) has dramatically inflated the cost of MCI's entry strategy, even though by no stretch of the imagination could that strategy be described as the functional equivalent of resale. In sum, it was hardly unreasonable for the FCC to reject the incumbents' policy-based arguments against Rule 315(b).

B. The Act Does Not Make Ownership of Facilities a Prerequisite to Leasing Unbundled Elements.

The incumbents' attack on the FCC's refusal to read a facilities-ownership requirement into § 251(c)(3) suffers from the same flaws as their arguments against Rule 315(b): the statutory text does not unambiguously foreclose the FCC's reading, and it was reasonable for the FCC to reject the incumbents' policy arguments. Indeed, incumbents' pejorative assault on what they call

"sham unbundling," and their arguments that the FCC's rule will "read resale out of the Act"—and thereby threaten their cherished subsidies—amount to nothing more than a disagreement with the predictive judgments of the expert agency. But the FCC made detailed findings supporting its approach, and the incumbents have advanced nothing but *ipse dixit* in response.

1. *The Eighth Circuit Correctly Concluded That the FCC's Interpretation Is Not Unambiguously Foreclosed by the Statutory Text.*

The incumbents have not shown that the text of § 251(c)(3), either standing alone or in context, "has directly spoken to the precise question at issue" and unambiguously foreclosed the FCC's interpretation. *See Chevron*, 467 U.S. at 842-43. In upholding the FCC, the Eighth Circuit relied upon the "plain language" of § 251(c)(3), which expressly imposes on incumbents "[t]he duty to provide, to *any* requesting telecommunications carrier . . . nondiscriminatory access to network elements on an unbundled basis at any technically feasible point." § 251(c)(3) (emphasis added); *see also* Pet. App. 55a. Indeed, the Eighth Circuit agreed with the FCC that a "facilities ownership" requirement is *foreclosed* by that plain language, which "is cast exclusively in terms of obligations imposed on incumbent LECs, and . . . does not discuss, reference, or suggest a limitation or requirement in connection with the right of new entrants to obtain access to unbundled elements." *In re Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, First Report and Order, 11 F.C.C.R. 15499 at ¶ 294 (1996), Pet. App. 242a ("*Local Competition Order*").

The incumbents never address the FCC's reading of "any telecommunications carrier." Instead they rely on entirely different statutory language, which requires incumbents to provide access to "network elements . . . at any technically feasible point." § 251(c)(3). This language, they assert, shows that Congress contemplated that competitors would have their own facilities to con-

nect with leased facilities. But this is not an argument based on what the text says; it is an argument based on what the incumbents claim the text presupposes. Had Congress wanted to restrict leasing to carriers who owned facilities, it surely would have imposed the intended restriction directly—as it did in the immediately preceding section of the Act. *See* § 251(c)(2) (imposing a duty to provide interconnection only for carriers that own or lease facilities).

In any event, the text does not support incumbents. The statute merely imposes a duty on incumbents to make their network elements available in a way that enables competitors to interconnect with them if that is what competitors want. Elements provided under § 251(c)(3) will, of course, be used by new entrants that do have their own facilities; the statutory language on which the incumbents rely assures that these new entrants will be able to interconnect their elements with those they lease. And, it is equally true that a new entrant relying exclusively on leased elements would require a technically feasible point of interconnection with the incumbent's operational support systems—the computers and databases that run the local network. Otherwise it would be unable to order the elements, bill for them, and connect the leased elements to long-distance networks. Thus, the inference upon which the incumbents rely is untenable.

Nor are the incumbents correct that the broader "context" of § 251 compels the facilities-ownership limitation they seek to impose. As the incumbents would have it, a facilities-ownership requirement must be read into § 251(c)(3) because the absence of such a requirement "effectively nullifie[s]" the Act's resale provision (§ 251(c)(4)), in contravention of the canon of statutory construction that a statute should be interpreted so as to give meaning to all of its parts. BA 2. But for two reasons that canon of construction is inapplicable.

First, the FCC's reading of § 251(c)(3) will have the effect the incumbents claim only if the incumbents are correct in their self-serving predictions that resale will

always be more expensive and otherwise less desirable than combinations of network elements. In other words, the incumbents' nullification argument depends on a series of empirical assumptions about contingent possibilities. That is not, in any meaningful sense, an argument about the statutory text, but is, instead, an argument about the reasonableness of the factual findings and policy judgments the FCC made in concluding that its approach would not read resale out of the Act. As will be demonstrated, the incumbents have raised no meaningful challenge to those findings and judgments, and thus they must be affirmed as reasonable. *See infra* pp. 14-21.

Second, the incumbents' own arguments make clear that the FCC's reading does not nullify the Act's resale provision. The very point of their "regulatory arbitrage" argument is that new entrants will use resale to compete for customers whose rates are presently subsidized, *see* U S West 45 ("because competitors can obtain subsidized services at a discount from the below-cost rates incumbents must charge, competitors can resell them at comparably below-cost prices"), while relying on unbundled elements (which are priced at cost-based rates pursuant to § 252(d)(1)) to compete for classes of customers whose rates generate the subsidies. Thus, even if the incumbents' views are correct, resale will remain the preferred option for competing for some classes of customers. Whatever else might be said of such an argument, it does not involve the " 'emasculat[ion of] an entire section' of a statute." BA 60 (quoting *Bennett v. Spear*, 117 S. Ct. 1154, 1166 (1997)).

In sum, because the incumbents' construction of § 251 (c)(3) "is not an inevitable one," the FCC's contrary view must be upheld so long as it is reasonable. *Regions Hosp.*, 118 S. Ct. at 916-17. The FCC's interpretation easily passes muster under that deferential standard.

2. *The FCC's Decision Not to Impose a Facilities Ownership Limitation Was Not Arbitrary and Capricious Or Otherwise Unreasonable.*

The incumbents have not shown that the FCC acted in an arbitrary or unreasonable manner in rejecting their demand that only new entrants with their own facilities be permitted to lease unbundled facilities.

First, the key premise of the incumbents' argument—that resale will always be more expensive than relying exclusively on network elements—is wrong. In some states, the price of the "platform" of all of the elements combined together is lower than the resale price. But in others the resale price for new entrants is *less* than the cost of leasing only the wire loop and port on the switch connecting the home to the switch, without even considering the cost of switching and the other elements necessary to provide service.[5] Furthermore, much of the attractiveness of using elements today results from the fact that lessors can compete in the highly profitable market for exchange access—charging long-distance companies for the use of the local lines needed to begin and end long distance calls—while resellers cannot. But this is not a permanent state of affairs; competition will reduce the price of access. When that happens, different market conditions will prevail, and market participants will make new calculations about the relative merits of building, leasing elements, or reselling existing services.

Second, resale and relying exclusively on leased elements are not "functional equivalents." As the FCC

---

[5] For example, the monthly resale price for providing residential service in Texas ranges from $6.39 to $8.66. *See Southwestern Bell Telephone Company Texas Local Exchange Tariff, 3.1.1 Residential Service*, at 3 (issued Jan. 27, 1995) (effective March 3, 1995); *Petition of MFS Communications*, Docket Nos. 16189 *et al.*, Arbitration Award, at 17-19 & Appendix B (Pub. Util. Comm'n Tex. Nov. 7, 1996). In contrast, the cost of leasing the loop and switch port alone is $17.05—almost double the highest resale rate. *Petition of MFS Communications*, Docket Nos. 16189 *et al.*, Arbitration Award, at Appendix B (Pub. Util. Comm'n Tex. Dec. 19, 1997).

found, resellers and lessors face entirely "different opportunities [and] risks." *Local Competition Order* ¶ 331, Pet. App. 244a. "[C]arriers reselling incumbent LEC services are limited to offering the same service an incumbent offers at retail." *Id.* ¶ 332, Pet. App. 244a. On the other hand,

> a carrier offering services solely by recombining unbundled elements can offer services that differ from those offered by an incumbent. For example . . . carriers using unbundled elements can bundle services that incumbent LECs sell as distinct tariff offerings, as well as services that incumbent LECs have the capability to offer, but do not, and can market them as a bundle with a single price. The ability to package and market services in ways that differ from the incumbent's existing service offerings increases the requesting carrier's ability to compete against the incumbent and is likely to benefit consumers. . . . These services, however, are not available for resale under section 251(c)(4) of the 1996 Act.

Id. ¶ 333, Pet. App. 244a-245a (footnotes omitted). Moreover, a competitor who leases the full "platform" of elements to provide service can combine the leased network in any way it sees fit, while the reseller can only use the network exactly as it is configured by the incumbent. Respondents contest none of this.

Indeed, the incumbents do not really argue that these two entry vehicles are the same. The essence of their position is that relying on leased elements is in every respect superior to resold service, and therefore to "preserve" resale, only competitors who already own some of their own facilities should be able to lease elements. *See, e.g.*, BA 62. In its order, however, the FCC concluded that resale did not need "protection," because although carriers "taking unbundled elements may have greater competitive opportunities than carriers offering services available for resale, they also face greater risks." *Local Competition Order* ¶ 334, Pet. App. 245a. As the FCC explained:

> A carrier purchasing unbundled elements must pay for the cost of that facility. . . . It thus faces the risk that end-user customers will not demand a sufficient number of services using that facility for the carrier to recoup its cost. (Many network elements can be used to provide a number of different services.) A carrier that resells an incumbent LEC's services does not face the same risk. This distinction in the risk borne by carriers entering local markets through resale as opposed to unbundled elements is likely to influence the entry strategies of various potential competitors.

Id.

The incumbents would have this Court reach precisely the opposite conclusion, on the theory that because all necessary elements can be leased on an "as needed" basis, lessors "need bear no risk of demand fluctuation." BA 62. But such a bold assertion, unsupported by any record evidence, provides no basis for overturning the FCC's contrary findings as arbitrary and capricious. Moreover, it is simply not the case that all elements may be leased on an as needed basis. The local loop, the "port" that connects the loop to the switch, and other elements are all priced at flat rates. Additionally, to compete in the market for exchange access, new entrants must lease facilities and develop billing and support systems the cost of which may or may not be recouped, depending on how much long distance service their customers use. In sum, just as the FCC determined, unlike a reseller, a lessor has no predictable margin, and faces the risk of unused capacity. For all of these reasons, competitors have chosen and will continue to choose to resell rather than to lease in a variety of market settings: for example, when the customer is receiving a subsidized rate, or when the competitor needs quick or easy entry into the market. The incumbents' argument to the contrary ignores the record and misstates the facts.

Third, the incumbents have nothing to say about the FCC's administrative and policy justifications for rejecting the facilities-ownership limitation on § 251(c)(3).

The FCC determined that such a limitation would be "administratively impossible" because "it would not be possible to identify the elements carriers must own without creating incentives to build inefficient network architectures that respond not to marketplace factors, but to regulation" and any such limitation "would likely be so easy to meet it would ultimately be meaningless." *Local Competition Order* ¶ 339, Pet. App. 248a. The FCC also concluded that such a restriction would artificially limit competition to those few markets that could "efficiently support duplication of some or all of the incumbent LEC's networks." *Id.* ¶ 340, Pet. App. 249a. Unable to respond to a single one of these conclusions, the incumbents instead berate the FCC for "seek[ing] shelter in policy arguments of [its] own." BA 63. That is, however, the FCC's job.

Fourth, and most importantly, it was eminently reasonable for the FCC to reject the incumbents' argument that the absence of a facilities-ownership restriction on § 251 (c)(3) will "subvert[] the important goal of preserving universal telephone service," BA 2, by subjecting the monopoly retail rates that allegedly fund such service to competitive pressures. The very point of the Act is to create local competition that will drive down those supracompetitive prices. As the incumbents themselves acknowledge, "[i]nterservice subsidy arrangements were economically sustainable only because the States preserved . . . legal barriers to entry." BA 4. Congress understood that the existing system of alleged implicit subsidies would not survive in a competitive market, and intended to replace it with a system of subsidies that "should be explicit, rather than implicit, as many support mechanisms are today." H.R. Conf. Rep. No. 104-458 at 131 (1996) ("Conf. Rep.").

The incumbents nevertheless insist that Congress intended this change to come gradually, so that states would have a "potentially lengthy period" of time, BA 50, in which to make the transition to a system of express "universal service" subsidies. In particular, they argue that

the current system of rate averaging should remain in place until full-fledged competing physical networks have emerged. From this they insist that it follows that the Act's leasing provision was designed to be an extremely limited transitional device, lest competition develop too quickly. Congress, the story goes, intended rapid competition to develop only through resale, a method that accordingly was designed to protect the current system.

But § 251(c)(3) is not a transitional measure—it imposes permanent obligations on the incumbents—and it contains no express or implied judgment that leasing is disfavored, or disfavored during some undefined interim period. Indeed, the FCC correctly found that Congress did not "express[] a preference for one particular entry strategy," but created alternative paths new entrants could employ "as market conditions and access to capital permit." *Local Competition Order* ¶ 12, Pet. App. 137a-138a. By requiring incumbents to facilitate all three types of competitive entry equally, Congress was drawing on past experience opening the long-distance market, where the Bell System's monopoly was broken up through a market-driven combination of resellers, lessors, and companies that built their own facilities. Congress was not attempting to micro-manage the development of local competition any more than regulators micro-managed the successful transition to long-distance competition.

Moreover, the incumbents' argument rests not on the statutory text, but on yet another assumption—namely, that Congress understood that facilities-based competition would take years to develop, and wanted no real competition in the interim. But the incumbents insistently told Congress that cable companies could provide meaningful facilities-based competition in the here and now. *See, e.g., Antitrust and Communications Reform Act of 1993 (Part 2) on H.R. 3626; Hearing Before the House Subcomm. on Economic and Commercial Law of the Comm. on the Judiciary*, 103d Cong. 154 (1994) (statement of Edward E. Whitacre, Jr., Chairman and CEO of Southwestern Bell Corp.) (noting "cable television companies

. . . already have or are entering the local telephone service market"); *see also* Conf. Rep. at 148 ("[M]eaningful facilities-based competition is possible, given that cable services are available to more than 95 percent of United States homes."). If Congress wanted to protect the current system of rate averaging and implicit subsidies, it therefore surely would have mandated full implementation of § 254's universal service reform requirements in *advance* of allowing competition by owners of competing networks.

The fact is that Congress took the opposite approach. It mandated that the local competition provisions of the Act be implemented as quickly as possible. *See* § 251 (d)(1) (FCC must issue implementing regulations within six months); § 252(b)(1) (new entrants may invoke arbitration within 160 days of seeking interconnection agreements); § 252(b)(4)(C) (state commissions must resolve arbitrations within nine months). At the same time, Congress provided that federal universal service reform would be accomplished on a less expedited basis, *see* § 254(a), while state reform could be completed as quickly as was necessary to offset the effects of emerging local competition, *see* § 254(f).

In this regard, it is telling that the state commissions have not joined the incumbents in their attacks on the FCC's unbundling rules. After all, the current system of rate averages and hidden subsidies is not the product of the incumbents' altruistic desire to ensure that everyone can afford phone service. The current system is the product of *state* policy choices. Had the FCC threatened those state policies in any meaningful way, the states would have objected. Their silence speaks volumes about the legitimacy of the incumbents' claims.

Nor did the FCC "ignore[]" the problems the state commissions would face as they were forced to address the realities of a competitive market. *Compare* GTE 52. To the contrary, the FCC enacted a series of protective measures to address the possibility "that the requirements

of the 1996 Act may be disruptive to existing state universal service support mechanisms during the period commencing with this order and continuing until we complete our universal service proceeding to implement section 254." *Local Competition Order* ¶ 715 (JA 155); *see also id.* ¶¶ 715-732 (JA 155-67) (establishing interim access charge regime to protect implicit universal service subsidies during transition to local competition). Respondents do not even acknowledge the FCC's reasoned response to the issues they have raised.

While the incumbents' principal policy argument is grounded in the premise that Congress did not intend facilities-based competition to develop too quickly, its second argument is, to the contrary, that Congress wished to encourage, not discourage, facilities-based competition, and that an unlimited right to lease is inconsistent with that legislative command. This argument suffers from the same defect as the argument that Congress favored resale over leasing. Nothing in the statutory text supports the incumbents' suggestion that Congress "carefully calibrated," BA 51, the three methods of competing service to assure that one was favored over another.[6]

Moreover, the FCC found it would serve no rational purpose for regulators artificially to encourage the building of facilities when market conditions otherwise would lead a competitor to lease them. *Local Competition Order* ¶ 340, Pet. App. 249a. No rational competitor would choose to rely on the incumbents' facilities as a long-term strategy, because it would require levels of cooperation that the incumbent would have no incentive to provide. Long-term reliance on unbundled elements would require a massive investment in monitoring, regulating, and litigation costs. For such reasons, MCI has already invested almost two billion dollars in constructing its own facilities.

Finally, the most sensible way to promote the construction of competing facilities is to encourage leasing. A competitor that leases all of the necessary elements from

---

[6] *See supra* pp. 14-19.

the incumbent must first build the necessary operations support systems to order, repair, and bill for the leased elements,[7] and must decide which services to market. Then, as traffic volumes increase, or technological advancement makes building more economical than leasing, the competitor would find it relatively easy to substitute its own facilities for those it had previously leased from the incumbent. A reseller, on the other hand, is the furthest removed from a facilities-based provider, and would not develop systems or expertise that would be helpful if it subsequently chose to build its own facilities. It is leasing, not resale, that is the strategy of choice for competitors like MCI whose ultimate goal is to build their own facilities.

C. The Incumbents' Remaining Challenges to the FCC's Unbundling Requirements Are Without Merit.

The incumbents argue that the FCC exceeded Congress' plan in ordering the unbundling of such critical components of local service as operational support systems, directory assistance, operator service facilities, and vertical features. Once again, however, the incumbents have no argument that the plain text of the 1996 Act forecloses the FCC's unbundling rules. Their arguments rest instead on the most strained inferences from statutory text and proceed from the false premise that Congress wanted new entrants either to build their own facilities or to resell incumbent services rather than to rely on unbundled network elements. But Congress directly delegated to the FCC the task of prescribing nationwide rules for unbundling, including rules dictating what elements should be unbundled. Had Congress wanted to limit the FCC in the way the incumbents propose, it surely would have said so in a straightforward manner. It did not.

---

[7] These operational support systems allow the competitor to connect directly to the incumbents' elements, including in particular to the incumbents' *own* operational support system. *See infra* pp. 23-25.

1. *The Eighth Circuit correctly upheld the FCC's reasonable interpretation of the Act's definition of network elements.*

A network element is

> a facility or equipment used in the *provision* of a telecommunications service. Such term also includes features, functions, and capabilities that are *provided* by means of such facility or equipment, including subscriber numbers, databases, signaling systems, and information sufficient for billing and collection or used in the transmission, routing, or *other provision* of a telecommunications service.

§ 153(29) (emphasis added). The incumbents argue that this text imposes a requirement that a network element must be "unalterably rooted in discrete physical parts" of the network and must be used to transmit or deliver calls. *See* GTE 54-55. The Eighth Circuit rejected that implausible reading of the Act. *See* Pet. App. 41a-43a.

The statutory text does not limit "network elements" to call routing facilities, because it encompasses all facilities used in the provision of service as well as all the features, functions, and capabilities of those facilities used "in the transmission, routing, or *other provision* of a telecommunications service." § 153(29) (emphasis added). The incumbents argue that under the principle of *ejusdem generis* the term "other provision" of service is limited only to alternate means—in addition to transmission and routing—of *physical* delivery of a call. *See, e.g.*, U S West 40. But Congress previously defined the concept of "provision" of service broadly to include the features, functions, and capabilities that are "provided by" means of a facility, and it explicitly listed "information sufficient for billing and collection" as an example of network elements so defined. § 153(29). Provision of these features—critical to telecommunications service—is not a means of physical delivery of a telephone call.

Because Congress defined the term "provision" so broadly in the first part of § 153(29), the canon of

ejusdem generis does not dictate that the terms "transmission" and "routing" necessarily modify the later use of the same term and restrict it to physical delivery of a call. *See* GTE 56; U S West 40. Had Congress meant to restrict the meaning of the term "provision" after initially defining it so broadly, it would have done so explicitly. Instead, Congress emphasized again that "provision" of a service includes more than transmission and routing: the language specifies "transmission, routing, or *other*" provision of service; in context it cannot be taken to mean "transmission, routing, or *similar*" provision of service. The FCC reasonably found that because " 'transmission' and 'routing' refer to physical delivery, the phrase 'or other provision of a telecommunications service' goes beyond mere physical delivery." *Local Competition Order* ¶ 261 (JA 40).

a. *The FCC reasonably found that the incumbents must provide access to their operational support systems.*

Operational support systems ("OSS") are "software systems and accompanying databases that are necessary to process orders, handle billing, and provide maintenance and repair capabilities to phone customers." Pet. App. 42a. They allow a telephone company to assign and track the specific facilities that serve individual customers, advise new customers of their telephone numbers, and schedule repair visits when customers report service troubles. The FCC concluded, and the Eighth Circuit agreed, that OSS and the information it contains "fall squarely within the definition of 'network element.' " *Local Competition Order* ¶ 516 (JA 116-17); Pet. App. 42a-43a. In so doing, the FCC reasoned that the text of the Act reflects Congress' recognition that new competitors cannot enter local markets successfully without access to OSS, and found that "[o]perational interfaces are essential to promote viable competitive entry." *Id.* (citation and internal quotations omitted).

The FCC further found that incumbents must lease their OSS functions to competitors pursuant to § 251(c)(3) for three independent reasons. First, OSS is a network element because the systems themselves are " 'databases' " or " 'facilit[ies] . . . used in the provision of a telecommunications service,' " and their functions are " 'features, functions, and capabilities that are provided by means of such facilit[ies].' " *Id.* ¶ 517 (JA 117) (quoting § 153(29)). Second, OSS is a network element because the information contained in and processed by the systems is "information sufficient for billing and collection or used in the transmission, routing, or other provision of a telecommunications service." *Id.* Third, even if OSS were not itself a network element, access to OSS is a "term and condition" of access to other network elements, and must, therefore, be provided on a nondiscriminatory basis pursuant to § 251(c)(3) and (c)(4). *Local Competition Order* ¶¶ 510, 518-519 (JA 114-16, 118-19). The incumbents do not even address this third and independent ground for the ordering of competitors' access to incumbents' OSS. This ground in itself provides an adequate basis for upholding the FCC's interpretation of the Act. In any event, the incumbents' argument that OSS does not fall within the statutory definition of network elements because it is not a physical part of the call-routing network fails: meeting that requirement is not necessary because the incumbents fabricated it. *See supra* pp. 22-23. The Act's definition *explicitly* encompasses OSS functions like "billing and collection," which are neither physical nor parts of the call-routing network.

Beyond this, the incumbents can only take issue with Congress' policy choices. They complain that allowing competitors access to their software would allow new entrants to run their business "just as efficiently as incumbents." GTE 59. But that is precisely what Congress hoped to accomplish when it included "databases" and "information" in the definition of network elements and directed nondiscriminatory access to those elements. *Local*

Competition Order ¶¶ 510, 518-519 (JA 114-16, 118-20). Incumbents' complaint is with the Act and not with the FCC.

b. ***The FCC reasonably found that directory assistance, operator service facilities, and vertical features are network elements.***

The Eighth Circuit's "agreement with the FCC's determination that the Act broadly defines the term 'network element' " properly led the court "also to agree with the Commission's conclusion that operator services, directory assistance, caller ID, call forwarding, and call waiting are network elements that are subject to unbundling." Pet. App. 44a. The court held that operator service facilities and directory assistance are "features, functions, or capabilities that are provided by facilities and equipment that are used in the provision of telecommunication services." *Id.* Operator service facilities include the physical equipment used to complete certain types of calls mechanically (such as calling card calls), frequently without any human intervention, as well as live operators who can, when needed, use the equipment to switch or complete calls. Contrary to the incumbents' rhetoric, it is *not* live operators that the FCC "deemed 'elements' of the network subject to unbundling." GTE 57. Rather, it is the "function" and "capability" provided by the operator services system that the FCC and the Eighth Circuit agreed fall within the Act's definition of network elements. It matters not that some human services may be involved. Human intervention is often required to deliver the features, functions, and capabilities of network equipment that are indisputably network elements.[8] For example, a switch may need to be reconfigured or to have routing information added to its database, and people perform these functions. Congress drew no line excluding the human support necessary to deliver the functions of a network element.

---

[8] Indeed, labor costs are included in the pricing of most network elements. *See supra* n.4.

Incumbents also challenge the FCC's inclusion of the software features of the switch that the incumbents use to provide caller ID, call forwarding, and call waiting as network elements. *See Local Competition Order* ¶ 423 (JA 95). The Eighth Circuit properly deferred to the FCC's judgment that these so-called "vertical features" of switches are features and functions of the switch that are no different from any other "features, functions, and capabilities" of the switch which competitors therefore have the right to lease at cost-based rates. § 153(29); *see* Pet. App. 42a-43a, 47 C.F.R. §§ 51.307(c); 51.319(c)(i)(C); *Local Competition Order* ¶¶ 412-413, 423 (JA 86-88, 95). The FCC held that switching is a "network element" that includes all of the features, functions, and capabilities of the switch: both the basic software embedded in the switch needed to route any telephone call and the switching software that makes possible *added* services such as caller ID, call forwarding, and call waiting. Both the FCC and the Eighth Circuit found this result compelled by the plain meaning of the statutory text. *See* Pet. App. 43a.

In the incumbents' view, the Court of Appeals erred in refusing to consider the practical consequences of the FCC's approach. Those consequences, the incumbents argue, are that, by leasing, competitors will be able to offer their customers services like call forwarding at a lower retail price than the inflated prices the incumbents are currently offering. The incumbents insist that if competitors can compete effectively by offering such enhanced local telephone services at cost-based rates, competition will deny the monopolists the profits they claim to need to support implicit universal service subsidies. *See, e.g.*, GTE 52-53.

That policy rationale is insupportable. A competitor's ability to offer vertical features at a lower price than an incumbent's current price is precisely what Congress intended. For the reasons previously stated, *see supra* 17-20, the incumbents' arguments based on the need to preserve universal service are groundless.

Nor do respondents gain anything by calling certain pieces of the telephone network "services." The incumbents contend that all of these systems—operator service systems, directory assistance, and vertical features—are "services" rather than "facilities," and therefore do not qualify as network elements. But the FCC and the Eighth Circuit agree that simply because certain features or functions of equipment may also be characterized as services does not preclude their characterization as network elements. *Local Competition Order* ¶ 263 (JA 41); Pet. App. 42a, 44a-45a. Indeed, the incumbents assert a distinction without a difference: *all* services are comprised of collections of features, functions, or capabilities of network facilities or equipment. The Eighth Circuit held that vertical features "satisfy the definition of 'network element;' consequently they are subject to the unbundling requirements of subsection 251(c)(3)." Pet. App. 45a. It agreed with the FCC that the incumbents' arguments to the contrary "would allow the incumbent LECs to evade a substantial portion of their unbundling obligation." Pet. App. 44a-45a.

For example, switching and lines that run from the switch to the business location have all been or could easily be offered as "services" available to retail customers. If none of these elements could be considered "network elements," the statutory provisions that allow for competitive service through unbundled network elements would be a dead letter. Nothing in the Act says (or even suggests) that "services" and "elements" are mutually exclusive categories, and the FCC's interpretation of the term facilities is, as the Eighth Circuit held, consistent with the Act's purposes. It must, therefore, be sustained.

D. The Eighth Circuit Correctly Upheld the FCC's Reasonable Interpretation of the Act's Standards for Competitors' Access to the Incumbents' Network Elements.

The incumbents also take issue with the FCC's implementation of § 251(d)(2), arguing that the agency ne-

gated the Act's limitations on competitor access to incumbents' network elements. *See, e.g.*, GTE 49. Section 251(d)(2) provides that the FCC, in determining what network elements should be unbundled pursuant to § 251(c)(3), "shall consider" whether access to proprietary network elements is "necessary" and whether the failure to provide access to such network elements would "impair the ability of the telecommunications carrier seeking access to provide the services that it seeks to offer." § 251(d)(2).

The incumbents disagree with the FCC's refusal to include in the "necessary" and "impairment" analyses an inquiry into the availability of similar but not identical network elements from alternate sources, *i.e.*, those outside the incumbents' networks. The incumbents argue that this refusal discourages innovation, particularly as to proprietary elements, BA 67, and that it creates disincentives to facilities-based competition. They invoke the antitrust doctrine of essential facilities in proposing that the proper analysis should examine whether the competitor can reasonably or practically duplicate the relevant element, BA 66, or at the very least should examine the availability of existing alternatives outside the incumbent's network, GTE 62.[9]

The factors Congress enumerated, however, need only be "considered." Having done so, the FCC is free to reach a reasoned conclusion that the element must be provided even if not necessary and not impairing the competitors' service. *See Shalala v. Guernsey Mem'l Hosp.*, 514 U.S. 87, 95 (1995); *id.* at 103 (O'Connor, J., dissenting) (agreeing with majority that where Medicare Act provides that Health and Human Services "shall consider" generally accepted accounting principles in prescribing Medicare reimbursement standards, the Secretary retains "broad and

---

[9] Of course, if the antitrust and the Act's standards were the same, there would be no need for the Act in this regard, because competitors would achieve no more and no less by invoking the Act rather than the antitrust laws.

flexible authority" and "is not bound" to adopt these specific principles). Thus, incumbents' argument that § 251 (d)(2) expressed a congressional policy of truncating the availability of network elements cannot stand scrutiny. Beyond that, the FCC had ample basis to reject the notion that incumbents need not provide proprietary elements if competitors can obtain similar elements from a source outside the incumbents' networks, *Local Competition Order* ¶ 283 (JA 51-52), and to reject the incumbents' position that competitors are not impaired in providing service if they can obtain similar elements from another source or can provide the proposed service through resale; *id.* ¶ 286 (JA 53-54).

The FCC could hardly have been on firmer ground in so rejecting the claim that "necessary" must mean "indispensable," an interpretation that this Court has rejected in a similar context as too rigid for a word that should "be harmonized with its context." *Armour & Co. v. Wantock*, 323 U.S. 126, 129-30 (1944); *see also M'Culloch v. Maryland*, 17 U.S. (4 Wheat.) 316, 413 (1819) ("necessary" means "convenient, or useful"). The court of appeals determined that the FCC's definition was "a reasonable one and entitled to deference," Pet. App. 49a, agreeing with the FCC that "[a]n overly strict reading of the word 'necessary,' as the petitioners propose, would unduly restrict the unbundling duty of incumbent LECs and hinder the development of competition in the local telecommunications industry." *Id.* By the same token, the court found the FCC's definition of "impair" to be consistent with dictionary definitions and consistent as well with the Act's pro-competitive purposes. It therefore concluded that the agency's definition was entitled to deference under *Chevron*. *Id.* at 50a.

As to both the "necessary" and "impairment" standards, the incumbents' "alternative sources" position would simply nullify the Act's unbundling requirements. Incumbents control almost all the network elements that currently exist. A competitor could, of course, in theory—

with enough capital and enough time—build a competing network and so provide itself with all these network elements from other sources. To say, as the incumbents do, that the analysis should at least examine existing alternatives outside the incumbents' network is to say nothing: "As a practical matter, if it is more efficient and less costly for new entrants to obtain network elements from a source other than an incumbent LEC, new entrants will likely pursue the more efficient and less costly approach." *Local Competition Order* ¶ 287 (JA 54-55); *see* Pet. App. 48a. But if (as is likely) because of economies of scale and scope, the incumbent monopolist is the most efficient source of a network element, the Act requires that those economies be shared with competitors. *See Local Competition Order* ¶ 10, Pet. App. 136a-137a. As the Eighth Circuit observed, Congress required that the monopolists' network elements be made available for lease precisely so that incumbents would have to share those economies with potential competitors, because of the extraordinary time and expense involved in constructing duplicate ubiquitous telephone networks. Pet. App. 48a.

Moreover, "requiring new entrants to duplicate unnecessarily even a part of the incumbent's network could generate delay and higher costs for new entrants, and thereby impede entry by competing local providers and delay competition, contrary to the goals of the 1996 Act." *Local Competition Order* ¶ 283 (JA 51-52). The incumbents accuse the FCC of denigrating and deliberately ignoring the Act's purpose of promoting—against other forms of entry—facilities-based competition by simply masking the concept of facilities-based competition in the pejorative term "unnecessary duplication." *See* U S West 32. But, in fact, the FCC reasonably understood that Congress could not have desired *unnecessary* duplication. Instead, competition is enhanced and consumers benefitted when the decision whether to build or to lease is dictated to the greatest extent possible by the market. Additionally, it is competition, and not just facilities-based competition, that is the primary and most urgent goal of the Act. *See*

supra 21-22. As the Eighth Circuit reasoned in determining that the FCC's alternate sources ruling was a reasonable one entitled to deference:

> Allowing incumbent LECs to evade their unbundling duties whenever a network element could be obtained elsewhere would eviscerate unbundled access as a means of entry and delay competition, because many network elements could theoretically be duplicated eventually. The Act, however, provides for unbundled access to incumbent LECs' network elements as a way to jumpstart competition in the local telecommunications industry.

Pet. App. 48a.

The FCC reasonably interpreted the Act's standards for access to network elements.

II. CONGRESS GRANTED THE FCC THE AUTHORITY TO IMPLEMENT THE LOCAL COMPETITION PROVISIONS OF THE 1996 ACT, INCLUDING THE PRICING PROVISIONS.

Congress, in the 1996 Act, unambiguously preempted state laws governing a host of local competition issues and enacted in their place a set of comprehensive federal standards. Despite this, in the name of federalism and purported loyalty to congressional intent, the Eighth Circuit denied the FCC the jurisdiction to implement many of those new federal provisions—including the pricing provisions—thus depriving the FCC of the authority to implement key provisions of federal communications law. In so doing, the Eighth Circuit ensured that, contrary to Congress' intent, the key federal provisions of the Act will be authoritatively interpreted not in an orderly, comprehensive fashion informed by the analysis of the federal agency entrusted to interpret communications law, but instead in a piecemeal fashion, over many years, by federal courts that lack any expertise in national communication policy. In part as a result of that decision, the prospects for the rapid opening of local markets have been destroyed. Neither the text of the 1996 Act, nor policy concerns, nor

any other provision of the Communications Act can justify that decision.

A. The Plain Text of the Statute Confirms That the FCC Has Authority to Implement the Local Competition Provisions of the Act, Including § 251's Rate Provisions.

The Eighth Circuit's decision to strip the FCC of rulemaking authority over most of the local competition provisions—including the pricing provisions—depends on the false premise that nothing in the 1934 Act, or in the 1996 Act (which amended it), confers on the FCC plenary authority to implement the 1996 Act's local competition provisions. Respondents' arguments in support of this premise fail.

First, the argument flies in the face of the statutory text affirmatively granting the FCC rulemaking authority. Section 251(d)(1), which instructs the FCC to "establish regulations to implement the requirements of" § 251, is not merely a time constraint but an affirmative grant of authority. Indeed, the language of § 251(d)(1) is drawn from the virtually identical provision of the House Bill, *see* H. Rep. at 4 (§ 241(b)(4)), which clearly was intended as a grant of authority. *See* Conf. Rep. at 120 ("Section 241(b)(4) directs the Commission to establish regulations"); *see id.* at 121 (same). Moreover, in § 276(b) of the Act, Congress used virtually identical language that incumbents concede (BA 36) empowers the Commission to issue regulations to implement the Act's provisions on payphone services. *See, e.g., Sorenson v. Secretary of the Treasury*, 475 U.S. 851, 861 (1986) ("identical words used in different parts of the same act are intended to have the same meaning") (citation omitted).

Section 201(b) also provides the FCC with a broad source of power. Respondents are left with the difficult prospect of arguing that § 201(b)—which authorizes the FCC to prescribe regulations "to carry out the provisions of the Act"—does not mean what it says. BA 43-44; GTE 33-34. They suggest that this clear grant of au-

thority should be limited by "context" to apply only to interstate communications. But Congress knew well the difference between a grant of authority that was section-specific, and a grant of authority that affected the entire Act. *Compare* § 317(e) ("The Commission shall prescribe appropriate rules and regulations to carry out the provisions *of this section*") (emphasis added), *with* § 201(b) ("Commission may prescribe rules and regulations . . . to carry out the provisions *of this Act*") (emphasis added).[10] Section 201(b) makes clear that Congress granted the FCC authority to prescribe regulations to carry out the provisions of the Act.[11]

Second, respondents have no cogent response to the point that their reading of § 251(d)(1) and § 201(b)

---

[10] While § 201(b) grants the FCC regulatory authority to implement the provisions of the Communications Act, provisions such as § 276(b) and § 317(e) not only *grant* the FCC authority, they also *require* the exercise of that authority or add particular instructions regarding its exercise.

[11] Respondents rely on legislative history to suggest that the last sentence of § 201(b) applies only to that portion of § 201(b) that allowed radio companies to furnish reports of the location and positions of ships at sea to newspapers without charge. *See* NARUC 27. Respondents thus suggest that when Congress gave the FCC the power to implement the provisions of "this Act" it actually meant to give the FCC the power to implement the "last sentence of part (b) of this section of the Act." To state the argument is to refute it. Indeed, respondents misread the legislative history: Earlier in the bill that added the last two sentences of § 201(b), Congress used the same term—"this Act"—in a context that plainly refers to the Communications Act, making clear that Congress' use of the same term in the next sentence could not have been accidental. *See Wisconsin Dep't of Revenue v. William Wrigley, Jr., Co.*, 505 U.S. 214, 225 (1992) (a phrase "ought to be accorded a consistent meaning within the section"). Finally, in passing this provision, Congress *explicitly* noted that it was amending § 201(b) of the Communications Act, *see* Communications Act of 1934, amendment, Pub. L. No. 561, 52 Stat. 588 (1938); Congress thus had to know that giving the FCC the power "to carry out the provisions of this Act" would give the FCC the broad power to implement the Act that the new bill amended, *i.e.*, the Communications Act of 1934.

would leave the FCC without authority to implement many of the other provisions of § 251, which all agree it may implement. *See, e.g.*, Pet. App. 12a n.10. These other provisions are not, as respondents claim, specific grants of authority in themselves. Most of these sections *presume* FCC power to regulate; they do not grant it. *See, e.g.*, § 251(c)(4)(B) ("a State commission may, *consistent with regulations prescribed by the Commission under this section*, prohibit" certain actions) (emphasis added); § 251(g) (requiring local exchange carriers to continue to comply with preexisting equal access and nondiscriminatory interconnection restrictions and obligations "until such restrictions and obligations are explicitly superseded *by regulations prescribed by the Commission*") (emphasis added). The text of these provisions also answers respondents' rhetorical question: "if section 251(d)(1) *already* provided the FCC with generic authority over all of sections 251 and 252, why would Congress have included these specific delegations of authority to the FCC?" BA 39 (emphasis in original). These provisions do not delegate authority to the FCC; they limit FCC authority delegated elsewhere or define limits on the power of state commissions. *See, e.g.*, § 251(d)(2) (limiting FCC authority by describing standards that the FCC must consider in determining what elements are available for unbundling); § 251(c)(4)(B) (giving state commissions the power to prohibit certain actions by a reseller, but limiting that power by requiring that it be "consistent with regulations prescribed by the Commission under this section").

Third, § 252(c)(2)—which provides that "[i]n resolving . . . any open issues . . . a State commission shall . . . establish any rates for interconnection, services, or network elements"—cannot bear the weight respondents place on it. Respondents' reliance on § 252(c)(2) is linked to their argument that the FCC lacks plenary authority to implement §§ 251 and 252. They contend that § 252(c)(2) unambiguously grants state commissions the power to set rates and pricing methodologies, BA 20;

GTE 27-28, or, at the very least, § 252(c)(2) confirms Congress' understanding that the FCC lacks such authority, and that the state commissions possess it.

Nothing in § 252(c)(2) can plausibly be read to deprive the FCC of jurisdiction to implement any of the provisions of the 1996 Act. Section 252(c)(2) merely assumes that state commissions will at times set rates, and it imposes substantive limits on state commissions when they do. The provision is conditional: It provides that "[i]n resolving . . . any open issues . . . a State commission shall—establish any rates . . . according to subsection (d)." § 252(c)(2). In terms, it requires only that whatever issues remain open, the state commission will resolve consistent with the limitations provided in § 252(c). *See, e.g.*, § 252(c)(1) (state commissions' resolution of any open issues must comply with § 251 and FCC regulations thereunder); § 252(c)(2) (state commissions' resolution of any open pricing issues must meet additional requirement of § 252(d)(1)).

Respondents suggest that § 252(c)(2) deprives the FCC of jurisdiction because it directs state commissions engaged in setting rates "to apply *solely* the standards of § 252(d)," and not the standards contained in § 252(c)(1), which incorporate by reference the FCC regulations promulgated under § 251. GTE 30 (emphasis added); *see also* BA 23. The word "solely," however, does not appear anywhere in § 252(c)(2), and with good reason. The restrictions on the state commissions' resolution of any open issues are conjunctive; thus § 252(c)(2) places an *additional* restriction on the state commissions' determinations of open issues concerning price: those determinations must comply with the requirements of § 252(d). The *additional* requirement imposed by § 252(c)(2), however, does not eliminate the other requirements imposed by § 252(c) with respect to "*any* open issues," a term which by its plain language includes price issues. In particular, § 252(c)(2)'s additional requirement governing pricing obligations cannot insulate such determinations from § 252(c)(1)'s directive to apply

"the regulations prescribed by the [Federal Communications] Commission pursuant to section 251." [12]

Moreover, the fact that § 252(c)(2) reflects Congress' assumption that state commissions would at times set rates does not deprive the FCC of jurisdiction over pricing methodology. Just as state commissions can resolve other "open issues" consistent with binding FCC regulations pursuant to § 252(c)(1), state commissions can "establish rates" pursuant to § 252(c)(2) by taking binding FCC regulations that prescribe a pricing methodology and applying them in concrete fact situations in a way that takes account of local conditions. *See also Local Competition Order* ¶¶ 135-137, Pet. App. 223a-224a.[13]

Fourth, the legislative history—and in particular the decision of the conference committee to split § 251 from § 252—does not help respondents. BA 24-25; GTE 29-31. The conference committee's decision to make §§ 251 and 252 separate provisions was not an effort to withdraw the FCC's authority over price and give it to the state commissions. Section 251 sets forth substantive standards for rates just as much as § 252 does. *See, e.g.*, § 251(c)(2)(D); § 251(c)(3); § 251(c)(4)(A). Moreover, Congress itself entitled § 252 "*Procedures* For Negotiation,

---

[12] For this reason, there is no merit to respondents' suggestion that petitioners' reading of the statute renders § 252(c)(2) "wholly superfluous." BA 24; GTE 29. Section 252(c)(2) imposes an additional requirement on state commissions when they resolve open rate issues that does not exist when state commissions resolve other open issues, thus making explicit that state commissions must comply with *both* the FCC's regulations *and* the requirements of § 252(d), including in particular § 252(d)(1)'s prohibition on using rate of return or other rate based methods.

[13] Respondents argue that § 252(c)(2) trumps § 251(d)(1) and § 201(b) because the specific controls the general. *See* BA 34; GTE 34. But that argument simply assumes its conclusion, *i.e.*, that there is a conflict between the two provisions that must be resolved. As noted above, however, there is no conflict (and thus no need to resolve the tension between a specific provision and a general one) because the provisions can, and therefore must, be read harmoniously.

Arbitration, and Approval of Agreements" (emphasis added). *See, e.g., INS v. National Ctr. for Immigrants' Rights, Inc.*, 502 U.S. 183, 189 (1991) (title of section can aid in resolving meaning of the statutory text). Given that Congress itself indicated that the separation of § 251 from § 252 was intended to embody a separation of the substance of the interconnection agreements from the procedures for negotiating and approving them, there is no reason to believe that Congress' decision to separate §§ 251 and 252 was at all intended to foreclose FCC regulation of prices.

Respondents' arguments are not bolstered by their reliance on unsupported and self-serving assertions that their allies successfully lobbied the conference committee to make these changes in order to protect state authority. *See* BA 25 n.13; GTE 30 & nn.15-16. These arguments —which ask this Court to interpret a statute based on the unsupported assertions of private parties that they successfully lobbied Congress—are not "legislative" history at all. *See Kelly v. Robinson*, 479 U.S. 36, 51 n.13 (1986) (declining to "accord any significance" to statements because "none of those statements was made by a Member of Congress, nor were they included in the official Senate and House Reports").

In any event, respondents' cavalier approach to legislative history ignores the conference committee's own assertion that it noted changes "except for clerical corrections, conforming changes made necessary by agreements reached by the conferees, and minor drafting and clerical changes." "Conforming" changes are those changes required as a result of other, explained agreements of the conference committee. The changes respondents claim were made in conference would have been radical, substantive changes, unrelated to any explained agreement of the committee, and thus cannot possibly be considered "minor" or "clerical" or "conforming" changes.[14] *See Central States Motor*

[14] Both the House bill and the Senate bill gave the FCC the regulatory authority over pricing the respondents claim the confer-

Freight Bureau, Inc. v. Interstate Commerce Comm'n, 942 F.2d 1099, 1107 (D.C. Cir. 1991) (R.B. Ginsburg, J.).

Fifth, respondents can reconcile their reading of the statute with the plain language of other provisions of the Act such as §§ 271 and 160 only by ignoring the terms of those provisions or reading in limitations that Congress did not include. *See* MCI Opening Brief at 36-38. For example, they suggest that in passing on an application to enter the long distance market pursuant to § 271, the FCC "can require no more than interconnection in accordance with the pricing principle promulgated *by the States*." BA 42 (emphasis in original). But that is not what § 271 says. Section 271(c)(2)(B) requires the FCC independently to determine whether the § 271 applicant has provided "[i]nterconnection in accordance with the requirements of Sections 251(c)(2) and 252(d)(1)." *See SBC Communications, Inc. v. FCC*, 138 F.3d 410, 416-17 (D.C. Cir. 1998). Section 251(c)(2) includes the requirement that rates be "just, reasonable, and nondiscriminatory." No fair reading of § 271 permits the conclusion that Congress gave state commissions the license to determine the future of the nation's long-distance telecommunications markets.[15]

Similarly, respondents' arguments that the FCC's forbearance authority is limited to "certain aspects" of § 251(c)—excluding price—ignores the fact that § 160 not only contains no such limitation, but in fact *requires* the FCC to consider whether charges are just and reasonable before the FCC may exercise that authority.

In sum, respondents' arguments cannot obscure what Congress has made clear: the FCC has authority to imple-

---

ence committee stripped away without comment. *See* MCI Opening Brief at 32.

[15] Respondents make no effort even to try to defend the procedural and jurisdictional chaos with respect to § 271 applications that would result from their reading of the Act, *see* MCI Opening Brief at 37, nor to explain why Congress would have created such a bizarre scheme.

ment the local competition provisions of the Act, including the provisions concerning rates.

B. Respondents' Contention That the 1996 Act Created a "Decentralized State-centered Scheme" Is Untenable.

Unable to make a case on the basis of statutory text, respondents once again resort to policy and rhetoric to justify limiting the FCC's authority to implement the substantive requirements of federal law. Respondents contend that Congress wanted a "decentralized, State-centered" approach, BA 44, that was "deregulatory," and advanced values of federalism. But it is simply not true that the 1996 Act sought to divest the federal government of powers that were transferred to the state commissions. To the contrary, the Act took back from the state commissions much of the substantive authority they had over intrastate matters under the 1934 Act. Indeed, respondents' arguments trivialize the revolutionary aspect of the 1996 Act. For the first time, Congress applied a comprehensive set of *federal* standards to govern entry into local markets. The 1996 Act is "State-centered" principally in the sense that the state commissions have been enlisted as partners in the administration of *federal* law embodied in the new national policy. It is manifestly *not* "State-centered" in the sense that state commissions decide all of the key substantive policy issues by themselves. That much is confirmed not only by the sweeping preemptive federal directives governing local competition, but also by Congress' choice of exclusive federal district court review of state actions applying the 1996 Act. *See Matsushita Elec. Indus. Co. v. Epstein*, 516 U.S. 367, 383 (1996) (one principal purpose underlying a grant of exclusive jurisdiction is "to achieve greater uniformity of construction") (internal quotation omitted).

The incumbents deride this argument as "audacious," BA 44, but the audacity is theirs. Here, they argue that the 1996 Act contemplated "differing discretionary judg-

ments" and "State autonomy and discretion." BA 45; *see also* GTE 40. But in federal courts in § 252(e)(6) proceedings, they conveniently advocate the opposite. Thus, for example, respondent U S West has argued that federal courts should apply a *de novo* standard of review and accord no deference to state commissions' determinations, because had Congress "intended that any deference be accorded the state commissions, it would not have precluded review in the state court systems, where deference to State commissions is routinely accorded." [16] Similarly, respondents have argued that "unlike a uniform application by a federal agency, a federal statute could be subject to 50 different interpretations in 50 different states. Under these circumstances, deference to a State agency's interpretation of federal law is not appropriate." [17] *See also GTE South Inc. v. Morrison*, Civ. Act. No. 3:97-CV-493, GTE's Brief in Opposition to the Commissioners' Motion for Partial Summary Judgment, at 7-8 (E.D. Va. filed Dec. 1, 1997) (deference to state agency is inappropriate because "giving deference to state agency interpretations of federal law would result in multiple, inconsistent legal interpretations of the federal statute around the country" and because "state agencies lack the expertise in implementing federal laws and the nationwide perspective characteristically possessed by a federal agency").[18]

---

[16] *U S West Communications, Inc. v. MFS Intelenet, Inc.*, No. 98-35146, Brief of Appellant, at 11 (9th Cir. filed June 11, 1998).

[17] *Southwestern Bell Telephone Co. v. AT&T Communications of the Southwest, Inc.*, Civ. Act. No. A-97-CA-132-SS, Motion for Summary Judgment of Southwestern Bell Telephone Company Based On Violations Of Statutory Standards and Supporting Brief, at 16 (W.D. Tex. filed Apr. 30, 1997).

[18] State commissions have unsuccessfully argued in § 252(e)(6) proceedings that a federal court should defer to decisions of state commissions on the meaning of federal law. Although this position avoids the brazen hypocrisy of the incumbents, it is simply wrong: federal courts do not defer to state agencies on questions of federal law. *See, e.g., AMISUB (PSL), Inc. v. Colorado Dep't of Soc. Servs.*, 879 F.2d 789, 795-96 (10th Cir. 1989); *Perry v. Dowling*, 95 F.3d 231, 236 (2d Cir. 1996). Unsurprisingly, the district courts have

Ultimately, incumbents are forced to concede that the 1996 Act adopted a "centralized" approach by providing for "ultimate federal oversight of State arbitrations," but they claim that Congress "chose a judicial, not an administrative, mechanism for this oversight." BA 5. Under incumbents' approach, the federal courts, on *de novo* review of state arbitration decisions, will decide the substance of the 1996 Act's federal requirements in a piecemeal fashion, over an extended period of time, and without the benefit of the views of the expert federal agency. But respondents offer no explanation why Congress would have wanted the federal courts and not the FCC to set national communications policy within the broad statutory framework. Moreover, as noted above, respondents' view that the Act contemplates a gradual unfolding of its key provisions is contrary to the numerous provisions of the Act that emphasize the need for rapid implementation, *see supra* p. 19, and would destroy the prospects for rapid competition in local markets, *see Local Competition Order* ¶ 618 (JA 131) ("such a process could delay competition for years"); *id.* ¶ 114, Pet. App. 212a ("Lack of national rules could . . . create great uncertainty for the industry, capital markets, regulators, and courts as to what pricing policies would be pursued by each of the individual states, frustrating the potential entrants' ability to raise capital.").

Respondents' invocation of "federalism" is similarly unavailing. BA 44-45, GTE 40-41. To be sure, the 1996 Act preserves a role for the state commissions if they choose

---

uniformly refused to defer to the state commissions on the interpretation of the 1996 Act. *See, e.g., U S West Communications, Inc. v. Hix*, Civ. Act. No. 97-D-152, Memorandum Opinion and Order, at 9 (D. Colo. Dec. 5, 1997) (*Chevron* deference is inappropriate because state commissions "have little or no experience in implementing federal laws and policies and do not have the nationwide perspective characteristic of a federal agency."); *MCI Telecommunications Co. v. Bell Atlantic-Virginia Inc.*, Civ. Act. No. 3:97-CV-629, Order Ruling on the Commissioners' Motion for Partial Summary Judgment, at 3 (E.D. Va. filed Dec. 24, 1997) (no deference to state agency).

to accept it, but it is not a "State-centered scheme" that permits state commissions to act under state law with only limited federal constraints. Instead, the Act imposes federal standards interpreted at a general level by the expert federal agency, with state commissions having autonomy to apply these federal regulations to local conditions. This is not "patronizing rhetoric," GTE 38, and does not reduce the state commissions to the "ministerial" and discretionless task of implementing the FCC's methodology. *See* BA 7. To the contrary, as the FCC found, "state commissions will make critical decisions concerning a host of issues involving rates," *Local Competition Order* ¶ 137, Pet. App. 224a, including decisions about the prime components of rates, such as depreciation, joint and common costs, and profit. *See id.* ¶¶ 686, 696, 702 (JA 140-41, 143-44, 146-47). *See generally Louisiana Pub. Serv. Comm'n*, 476 U.S. at 364-65 ("depreciation practices contribute importantly to the calculation of both the carrier's investment and its expenses"). Regulations that promulgate broad ratemaking methodologies but leave open for state commission determination most of the critical inputs that go into a rate cannot be said impermissibly to establish the rate, to relegate state commissions to performing "ministerial" functions, or to deprive state commissions of their considerable discretion in carrying out federal law.

In a similar vein, respondents mistakenly trumpet the statement in the Conference Report that the 1996 Act produced a "pro-competitive, de-regulatory national policy framework." BA 4; *see also* GTE 11. The issue is not *whether* the Act will be interpreted and applied by regulators, but rather *which* regulatory agency (or agencies) will perform this task. Respondents never explain why "deregulation" counsels in favor of vesting rulemaking authority in 50 different state commissions rather than in the FCC. For national competitors such as MCI, respondents' interpretation of the Act—which subjects competitors to 50 different sets of regulations—is anything but "deregulatory." Moreover, the "deregulatory" nature of the 1996 Act surely stems in large part from its elimination

of anticompetitive *state* regulations which previously governed intrastate telephone markets. The Act's "deregulatory" nature thus cannot support the view that Congress intended for state commissions rather than the FCC to implement the Act's new federal standards.

In sum, respondents' State-centered vision of the Act is not only inconsistent with the vision of the Act they have put forth in § 252(e)(6) proceedings around the country, it is at odds with the language and purpose of the statute, ignores the extension of *federal* law to intrastate matters, and results in an irrational and unworkable scheme for local competition.

C. Section 2(b) Does Not Deprive the FCC of Jurisdiction to Implement the Federal Standards That Govern Rates.

In the 1996 Act, Congress took the extraordinary step of subjecting intrastate telephone markets to federal substantive law for the first time and (in § 253) gave the FCC unambiguous authority to preempt "*any* statute, regulation, or legal requirement" imposed by a State that "prohibits or has the effect of prohibiting" an entity from providing intrastate or interstate telephone service. In this context, it would be illogical to conclude that Congress nonetheless intended that state commissions—whose enabling acts, rules, and regulations were the very ones superseded by 1996 Act—have the *sole* authority to implement the key pricing provisions of the 1996 Act. *Cf. United Savs. Ass'n of Tex. v. Timbers of Inwood Forest Assoc.*, 484 U.S. 365, 371 (1988) ("A provision that may seem ambiguous in isolation is often clarified by the remainder of the statutory scheme . . . because only one of the permissible meanings produces a substantive effect that is compatible with the rest of the law"). Nothing in § 2(b) requires this illogical result. First, even under respondents' mistaken understanding of § 2(b), § 2(b) erects no barrier to the FCC's implementation of the local competition provisions of the Act. Just as Congress provided in a straightforward and unambiguous manner for

the federal local competition provisions—including the pricing provisions—to *apply* to intrastate telephone services, Congress provided in a straightforward and unambiguous manner to *give the FCC jurisdiction* over those same services. Second, as MCI demonstrated in its opening briefs, § 2(b) was intended to limit only the FCC's *ancillary* jurisdiction over intrastate matters not governed by substantive federal law and has no application when, as here, federal law clearly applies to those matters.

As described above, *see supra* p. 34, in §§ 251(d)(1) and 201(b), Congress unambiguously gave the FCC authority to implement the local competition provisions of the 1996 Act. Respondents contend nonetheless that Congress' expression of its intent is insufficiently clear to satisfy § 2(b), on the theory that § 2(b) "precludes the FCC's assertion and exercise of authority over intrastate pricing and related matters without an *express* grant of jurisdiction over such matters." CA 33 (emphasis in original).[19]

That cannot be correct. The statement of congressional intent necessary to overcome § 2(b)'s presumption that the Communications Act does not "apply" to intrastate matters is the same as that necessary to overcome § 2(b)'s presumption that the Act does not "give the Commission jurisdiction" to regulate intrastate matters. Thus, if respondents are correct about what is necessary to overcome the § 2(b) presumption, then virtually *none* of the obligations in § 251 would even *apply* to intrastate communications. For virtually none of § 251's local competition provisions explicitly mentions intrastate matters or otherwise demonstrates the kind of "comparable language" that respondents assert is required. Respondents' § 2(b) argument would thus render the 1996 Act a nullity.

Uncomfortable with the implications of their argument, respondents simply ignore them, and blithely assert that

---

[19] *See also* NARUC 33 ("The absence of an *explicit* grant of federal authority in sections 251 and 252 is fatal to the FCC's jurisdictional claim") (emphasis added)); BA 36; GTE 44.

Congress unambiguously intended for the pricing provisions of the Act to apply to intrastate matters but deny that Congress made sufficiently clear its intent that the FCC implement those provisions. But they cannot ignore that the applicability of § 251 to intrastate matters is just as "implicit" as—and is no more unambiguous than—the authority of the FCC to implement that section. Just as § 251(c) sets forth substantive federal requirements that all agree apply to intrastate matters, *see, e.g.*, GTE 11; *Local Competition Order* ¶ 71, Pet. App. 179a-180a ("None of the commenters appears to claim that section 251 addresses exclusively interstate matters"), § 251(d)(1) gives the FCC authority to implement those requirements.[20]

Moreover, this examination into whether Congress indicated its intent with sufficient clarity is unnecessary because § 2(b) limits only the FCC's *ancillary* jurisdiction. Thus, § 2(b) precludes the FCC from exercising jurisdiction over matters to which federal law does not unambiguously apply, *i.e.*, the sort of jurisdiction approved by this Court in *Shreveport*. Respondents' arguments to the contrary are unpersuasive. For example, respondents accuse petitioners of ignoring the term "or" and eliminating the second clause of § 2(b). BA 29; GTE 45. But this is simply incorrect. Petitioners merely disagree with respondents about the meaning of the second clause. As MCI indicated in its opening brief, the second clause of § 2(b) was intended to preclude the FCC from exer-

---

[20] Respondents also argue that § 251(d)(1) cannot grant the FCC jurisdiction to implement the pricing provisions because, in contrast to § 276 of the Act, which explicitly refers to "intrastate and interstate" calls, § 251(d)(1) makes no mention of intrastate matters. BA 36; GTE 44. In § 276, however, had Congress omitted the term "intrastate," it would have been unclear whether the payphone provisions applied at all to intrastate matters. With respect to the local competition provisions, all concede that the relevant provisions of the Act clearly apply to intrastate matters, so the added specificity that was critical in § 276 to ensure that the substantive provisions applied intrastate would have been completely redundant.

cising ancillary jurisdiction; there is simply no indication that the clause was intended to perform the quite different function of severing the jurisdiction of the FCC from the substantive reach of federal law.

Respondents' treatment of the interaction of § 2(b) with § 201(b) only highlights their insupportable approach to statutory interpretation. They argue that the plain language of § 201(b) cannot mean what it says because it is limited by "context," and that, even if it does, it is trumped by § 2(b). But respondents' approach, in addition to doing violence to the plain language of § 201(b), relies on an inconsistent approach to context, using it to limit the plain meaning of § 201(b) but ignoring it when deciding the meaning of § 2(b). Respondents are forced into this inconsistency because, under their erroneous understanding of § 2(b), the provisions are in irreconcilable conflict. But as MCI showed in its opening brief, that conflict is purely one of respondents' own creation. In fact, the provisions are complementary: § 201(b) gives the FCC authority over interstate and intrastate matters to the extent that federal law applies to those matters, and § 2(b)—which limits the FCC's ancillary jurisdiction—provides that the FCC may go no further. *See Louisiana Pub. Serv. Comm'n*, 476 U.S. at 370 ("where possible, provisions of a statute should be read so as not to create a conflict").

Similarly meritless is respondents' assertion that *Louisiana* resolved the question now before this Court. In *Louisiana*, the Court resolved two separate issues; first, whether § 220 of the Act, establishing a uniform system of accounts, itself preempted state law, and second, if it did not, whether the FCC nevertheless could exercise *ancillary* jurisdiction—*i.e.*, jurisdiction over matters to which the Act did not directly apply—to preempt state law concerning depreciation. In the instant case, however, the contested division of authority between the FCC and the state commissions has nothing to do with preemption because Congress has already made the decision to preempt state law. Whatever entity regulates will indis-

putably be implementing new provisions of *federal* law that now govern local (*i.e.*, intrastate) telephone markets. Nothing in the holding of *Louisiana* suggests that § 2(b) was intended to deny the FCC jurisdiction even when federal law clearly applies and preempts state law.

Respondents nevertheless suggest that the ancillary jurisdiction argument is untenable because the *Louisiana* Court rejected the argument that § 2(b) was intended solely to prevent application of the *Shreveport* doctrine. *See* BA 30; GTE 46. But the *Louisiana* Court rejected an entirely different argument based on *Shreveport*. Respondents there argued that because *Shreveport* applied only to "rates," § 2(b) also applied only to rates and not to the other intrastate matters such as depreciation. Thus, the Court noted that it was "certainly true" that § 2(b) was intended to prevent "excessive federal regulation of intrastate service such as was sanctioned by the *Shreveport Rate Case*," but found "no authority in the legislative history to support respondents' proposition that the sole concern of the state commissioners was with 'protection against federal preemption of the states' setting of *individual customer charges* for specific intrastate services.' " 476 U.S. at 372 (citation omitted) (emphasis added). The *Louisiana* decision thus was not a rejection of the contention that § 2(b) was intended to overturn the *Shreveport* ancillary jurisdiction principle, but rather was a rejection of respondents' overly restrictive characterization of what that principle was.

Finally, there is no merit to respondents' argument that the legislative history of the 1996 Act is inconsistent with petitioners' approach. GTE 42-43; BA 27-28. Respondents view the conference committee's decision not to amend § 2(b) as working a major substantive change, even though that change appeared nowhere in the conference report. As noted above, that inference is flatly inconsistent with the conference committee's own description of its actions. *See supra* pp. 37-38. Respondents' reading of the conference committee's actions is particularly inappropriate when there is a ready explanation for those

actions: because an amendment to § 2(b) would be redundant with respect to the FCC's authority over the substantive provisions of the 1996 Act, amending § 2(b) could be seen as giving the FCC the license to exercise precisely the sort of ancillary jurisdiction the 1934 Congress had intended to prevent—for example, jurisdiction over local *retail* rates and depreciation, which remain regulated by state law. In any event, given the uninterrupted congressional practice of the last century and given Congress' decision to displace state laws governing competition in local markets, something more than silence is required to justify the conclusion that Congress intended to sever the FCC's authority to regulate from the reach of federal communications law.[21]

---

[21] California and NARUC suggest that the legislative silence supports their argument because § 2(b) has a 60-year history as a "universally understood reservation of State authority." CA 32; NARUC 36-37. But so far as petitioner is aware, § 2(b) has *never* been relied upon to deny the FCC jurisdiction to implement a federal provision that clearly applied to intrastate matters. Indeed, the state respondents' argument on this point serves only to underscore their inability to come to grips with the revolutionary aspect of the 1996 Act: Congress' decision to apply for the first time substantive *federal* law to intrastate matters.

CONCLUSION

The Eighth Circuit's decisions invalidating Rule 315(b) and stripping the FCC of plenary authority to implement the requirements of § 251 of the 1996 Act should be reversed, and its decision upholding the FCC's remaining unbundling rules should be affirmed.

Respectfully submitted,

QUESTIONS PRESENTED

1. Whether the Eighth Circuit, in disregard of *Chevron*, improperly invalidated regulations promulgated by the FCC implementing the 1996 Act that prohibit incumbent local monopolists from engaging in discriminatory conduct against new entrants seeking to lease parts of the incumbents' existing local telephone networks, and thereby thwarted Congress' goal of creating competition in local markets as quickly as possible.

2. Whether, in light of the explicit grants of authority to the FCC to establish regulations to implement the requirements of both the Communications Act and the local competition provisions of the Telecommunications Act of 1996 amending the Communications Act, the Eighth Circuit improperly held that the FCC exceeded its jurisdiction when it promulgated regulations implementing the federal pricing requirements of the 1996 Act, on the theory that the regulations applied to intrastate matters that had traditionally been subject to the jurisdiction of state public utility commissions.

LIST OF PARTIES AND AFFILIATES

The parties to the proceedings in the Eighth Circuit are listed at Pet. App. 1a-4a, 73a-79a, 92a.

Pursuant to Supreme Court Rule 29.6, petitioners state as follows:

MCI Telecommunications Corporation is a wholly-owned subsidiary of MCI Communications Corporation. MCI Telecommunications Corporation has the following non-wholly owned subsidiaries: General Communications, Inc.; IFP Holdings, Inc.; ICS Communications, Inc.; Digital Network Television, Inc.; Genesys Telecommunications, Inc.; Inflight Phone Corp.; Multimedia Medical Systems, Inc.; News T Investments, Inc.; News Triangle Finance, Inc.; Pioneer Holding L.L.C.; and Security Technologies, Inc.; Portugal Telecom.

PETITIONER'S BRIEF ON THE MERITS

JURISDICTION

The Eighth Circuit issued its decision on rehearing and its mandate on October 14, 1997. This Court has jurisdiction under 28 U.S.C. § 1254(1).[1]

STATUTORY PROVISIONS INVOLVED

This case involves the Telecommunications Act of 1996 (the "1996 Act"), Pub. L. No. 104-104, 110 Stat. 56, codified at 47 U.S.C. §§ 151-276. Relevant provisions are reprinted at Pet. App. 93a-130a.

STATEMENT OF THE CASE

MCI seeks reversal of the Eighth Circuit decision vacating FCC regulations that implement the 1996 Act, a landmark statute designed "to shift monopoly [telephone] markets to competition as quickly as possible."[2] In the 1996 Act, Congress asserted federal jurisdiction over local telecommunications matters that had previously been left to the States. Congress did so because historically the States had fostered monopoly provision of local telephone service, and Congress desired a uniform national policy "promot[ing] competition in the local telephone service market." *Reno v. American Civil Liberties Union*, 117 S. Ct. 2329, 2338 (1997). Specifically, Congress preempted all state laws that would restrict competition in local markets (47 U.S.C. § 253(a)) and required local telephone companies to make the local phone networks available for use by new competitors (47 U.S.C. §§ 251-252). Congress required the FCC to "establish regulations to implement" those new federal requirements within six months of the Act's passage. 47 U.S.C. § 251(d)(1). The FCC did so, but the Eighth Circuit invalidated many of those regulations, crippling the prospects for local competition.

---

[1] The Court of Appeals had jurisdiction to review the FCC's regulations pursuant to 28 U.S.C. § 2342(i) and 47 U.S.C. § 402(a), (b).

[2] *See* H.R. Rep. No. 104-204 at 89 (1995) ("H. Rep.").

The Regulatory Structure Prior to 1996. The nation's telephone system consists of local and long distance networks. A local network is an integrated system of wires and switches that connects all homes and businesses in a defined local service area. The long distance network consists of wires and switches that transmit telephone calls between local networks. The local network is used to provide local telephone service and is also indispensable to long distance service. A long distance call initiated by a customer first travels on a local network from the customer's premises to a point where it is handed off to a long distance company, which then transports the call to a distant point, where it is handed off to a second local network for completion. Prior to 1984, the Bell System operated an integrated network that provided local phone service in regions covering more than 80% of the nation's homes and businesses, and nearly 100% of all long distance service.

The Communications Act of 1934 divided responsibility for regulation of telecommunications markets into well-defined (albeit overlapping) spheres: federally-regulated interstate long-distance services, and state-regulated intrastate services. 47 U.S.C. § 152. *See Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355 (1986). Under this regulatory framework, state and federal regulators pursued fundamentally different goals. The States uniformly preferred a monopoly rate-of-return regime in which regulators could—through maintaining supracompetitive rates to some classes of customers, and subsidizing others—set intrastate retail prices that ostensibly ensured "universal service," but in fact responded more to political than to markets forces. *See generally* M. Kellogg et al., *Federal Telecommunications Law* 68 (1992). As Congress noted, incumbent local telephone companies historically have "been protected from competition by State and local government barriers to entry." H. Rep. at 49. In contrast, federal regulators in the last three decades promoted competition in the interstate long-distance market, and in doing so required local carriers to allow new long distance

competitors (such as MCI) to use the local network on reasonable terms to originate and terminate interstate long distance calls.[8]

The FCC's efforts to make the interstate market competitive were resisted by the Bell System, which used its control over local networks to discriminate against these new competitors in ways that evaded regulatory control. To halt that anticompetitive conduct, the Department of Justice brought a pivotal antitrust suit which resulted in the consent decree that broke up the Bell System. *See United States v. AT&T*, 552 F. Supp. 131 (D.D.C. 1982), *aff'd*, 460 U.S. 1001 (1983). That decree divested AT&T of the Bell Operating Companies ("Bell Companies"), which provided monopoly local service, and barred those divested companies from the long distance market to preclude any future possibility that they might use their control over local networks to harm long-distance competition. As a result, there is now vibrant long distance competition. *See AT&T Reclassification*, 11 F.C.C.R. 3271, 3307-08 (1995).

Notwithstanding these pro-competitive changes in the interstate market, the States persisted in suppressing competition in local markets. Local incumbents, including the individual companies spawned from the former Bell System, continued to operate their monoply franchises, while "state regulators helped sustain the [incumbents'] bottleneck control, arguably because they preferred the subsidies and price-averages the local monopoly allowed."

---

[8] Specifically, the FCC required incumbents to connect existing local networks with the facilities of the new competing long distance carriers so that customers could choose among competing long distance providers. *E.g., Specialized Common Carriers*, 29 F.C.C.2d 870 (1971), *aff'd sub nom. Washington Util. Comm'n v. FCC*, 513 F.2d 1142 (9th Cir. 1975). State public utility commissions and the incumbents unsuccessfully challenged these federal actions on the ground that they impermissibly invaded the States' authority over intrastate matters. *E.g., North Carolina Util. Comm'n v. FCC*, 537 F.2d 787, 791-94 (4th Cir. 1976); *National Ass'n of Reg. Util. Comm'rs v. FCC*, 880 F.2d 422, 431 (D.C. Cir. 1989).

SBC Communications, Inc. v. FCC, No. 97-1425, 1998 WL 121492 at *1 (D.C. Cir. Mar. 20, 1998) (quotation omitted). By 1996, the incumbent local carriers were still receiving over 99% of all local service revenues.[4]

The 1996 Act. In the 1996 Act, Congress radically changed the allocation of regulatory authority that had existed under the 1934 Communications Act, as well as the substantive policies that had prevailed under the old regime. Abandoning its acquiescence in state-regulated local monopolies, Congress preempted any state laws and regulations that "prohibit, or have the effect of prohibiting, the ability of any entity to provide any . . . intrastate telecommunications service." 47 U.S.C. § 253(a). Congress also mandated termination of the practice of implicit subsidies by which some customers paid below-cost retail rates while others paid inflated rates—requiring instead that "universal service" be assured through explicit subsidies funded by telecommunications carriers on a competitively neutral basis. *Id.* § 254. Congress recognized, however, that merely removing these regulatory impediments to competition would not make local markets competitive. It therefore went further and adopted uniform substantive federal requirements designed to reduce barriers to entry by authorizing new entrants to make use of existing local networks. Those requirements are at issue here.

Section 251 establishes three complementary routes new entrants can use to compete in local markets, each involving different economic characteristics and different physical arrangements. The first is pure facilities-based competition—that is, the construction of competing networks. A new entrant constructing its own network facilities must be allowed to "interconnect" with the incumbent's network. The 1996 Act therefore requires "interconnection." 47 U.S.C. § 251(c)(2). Without this net-

---

[4] *See Implementation of the Local Competition Provisions of the Telecommunications Act of 1996*, Notice of Proposed Rulemaking, 11 F.C.C.R. 14171 at ¶ 6 & n.13 (1996) (JA 8-9) ("NPRM").

work-to-network interconnection, a new entrant's phone service would have limited value because the new entrant's customers could not make calls to or receive calls from the incumbent's customers. But even with mandatory interconnection, this form of competition will take years to emerge "because the investment necessary [to build a competing network] is so significant." *See* H.R. Conf. Rep. No. 104-458 at 148 (1996) ("Conf. Rep.").[6]

The Act's second route for entry is "resale." § 251 (c)(4). Incumbents must permit new entrants to purchase their retail services at wholesale rates so that new entrants can compete by reselling these services under a different brand to retail customers. Resale allows quick and widespread entry. But resale presents only limited opportunities for price competition because the wholesale rate is calculated by subtracting from the retail rate the incumbents' "avoided costs"—that is, the costs the incumbent will save by virtue of being a wholesaler (47 U.S.C. § 252(d)(3)). Resale alone will not, therefore, drive retail prices to the cost-based levels that would prevail in a competitive market. Nor does the resale option permit innovation; new entrants may resell only the same services the incumbent offers its local customers.

The Act's third route for entry is leasing designated elements of the existing local network. Section 251(c)(3) requires incumbents to provide to new entrants "nondiscriminatory access to network elements on an unbundled basis . . . in a manner that allows requesting carriers to combine such elements in order to provide . . . telecommunications service." This provides new entrants with the flexibility to order some or all of the following basic components of the local network: (i) the interface box attached to the outside of the home or business connecting the phone line to the wires inside the home or business; (ii) the "local loop," which is the line that runs

---

[6] The FCC estimated that an investment of more than $29 billion would be required today to construct local networks capable of reaching even 20% of available subscribers. NPRM, ¶ 7 & n.15 (JA 9-10).

from the interface box at the customer's premises to the nearest switching center; (iii) the telephone "switches" (to which the local loops connect) which are essentially large computers that direct calls to their intended destinations; (iv) "transport" facilities, the wires that carry calls between switches; and (v) databases and other related support services. Making use of these elements, a new entrant could build its own switches and transport facilities while leasing wire loops and interface boxes from the incumbent to reach customers' homes. Or a new entrant could rely entirely on components of the incumbent's network, but use them to offer services the incumbent does not currently offer, or to compete in ways resale does not permit.

Recognizing that the price charged new entrants for these uses of the local network would determine the viability of these entry strategies, Congress established specific substantive federal requirements governing pricing. These federal pricing requirements were intended not only to ensure that new competitors would enter the market, but also that they would do so on an economically efficient basis. Thus, Congress required that these rates must be "just, reasonable and nondiscriminatory," and "based on . . . cost," 47 U.S.C. §§ 251(c)(3), 252(d)(1), and Congress specifically prohibited the traditional "rate of return" proceedings in which state regulators had set monopoly rates. § 252(d)(1).

The 1996 Act also sets forth procedures for translating these substantive federal requirements into action. Congress empowered new entrants to request interconnection, access to network elements, or resale, and required incumbents to negotiate with new entrants over these items. § 251(c)(1). Anticipating that incumbents would be unlikely to agree to terms that allow a new entrant to take away their customers, Congress gave state public utility commissions (or, if they are unwilling, the FCC) authority to adjudicate under federal law all disputed issues in a process the Act refers to as "arbitration." This process results in an "interconnection agreement" incor-

porating final terms (both negotiated and adjudicated).[6] §§ 252(b), (c). Congress placed tight time deadlines on this process: States are required to arbitrate final "interconnection agreements" within nine months of the time a new entrant first requests negotiations. § 252(b)(4)(C).

Congress assigned this adjudicatory role to state commissions because of their familarity with local conditions, but Congress was quite explicit that substantive federal law would govern resolution of any disputed issues. § 252(c)(1) (state commission shall "ensure that such resolution [of any open issues] . . . meet[s] the requirements of [§] 251 . . . including the regulations prescribed by the Commission pursuant to [§] 251"). To ensure that uniform federal standards were in place before § 252's negotiation and arbitration process commenced in earnest, Congress directed the FCC to "complete all actions necessary to establish regulations to implement the requirements of [§ 251]" within 6 months of passage of the 1996 Act. § 251(d)(1). As the Conference Committee explained, "it is important that the Commission rules to implement new section 251 be promulgated within 6 months after the date of enactment, so that potential competitors will have the benefit of being informed of the Commission['s] rules in requesting access and interconnection." Conf. Rep. at 148-49. As a further guarantee of uniformity, Congress granted federal courts exclusive jurisdiction to review state commission actions to ensure compliance with the requirements of §§ 251 and 252. § 252(e)(6). *See also* § 252(e)(4) (denying state courts jurisdiction to review interconnection agreements).

Finally, the local competition provisions of the 1996 Act also play a critical role in the process of determining whether the divested Bell Companies will be allowed to provide long distance service in their regions. Section 271 gives the FCC the responsibility to decide whether the Bell Companies will be allowed to enter long distance

---

[6] These "interconnection agreements" cover more than just "interconnection" provided by § 251(c)(2) of the Act, and include as well all terms related to access to unbundled elements and resale.

markets from which they are presently barred. In doing so, the FCC must determine whether the Bell Company has met a "competitive checklist," which includes many of the requirements of §§ 251 and 252—including, in particular, the pricing requirements. § 271(c)(2)(B).

The FCC Regulations. The FCC issued regulations on August 8, 1996. Two critical components of those regulations are at issue here. First, the FCC's Order implemented the 1996 Act's requirements concerning the prices competitors pay to interconnect with the incumbents' networks and to lease network elements. The FCC decided it was "critical . . . to establish among the States a common, pro-competition understanding of the pricing standards" that would govern relations between new entrants and incumbents. *In re Implementation of the Local Competition Provisions of the Telecommunications Act of 1996*, First Report and Order, 11 F.C.C.R. 15499 (1996) at ¶ 618 (JA 131) (*"Local Competition Order"*). The regulations accordingly establish a basic pricing methodology for state commissions to apply in establishing actual rates in light of particular local conditions. *See Local Competition Order* ¶¶ 618-954 (JA 719-879). The FCC determined that prices had to be based on the forward-looking economic cost of each of the leased elements as reflected in a methodology known as "Total Element Long Run Incremental Cost," or "TELRIC." As the FCC explained, setting prices at forward-looking cost is most consistent with the 1996 Act's goal of creating efficient competition as quickly as possible because it replicates the costs new entrants would incur in entering a competitive market, allowing them to price their own retail offering at levels that would prevail in a competitive market, and thereby "driv[ing] retail prices to their competitive levels." *Local Competition Order* ¶ 679 (JA 138).[7]

Second, the FCC issued regulations implementing the statutory unbundling requirements of § 251(c)(3), which

---

[7] The FCC's pricing regulations also implement the statutory provisions governing resale prices and prices for transport and termination. 47 U.S.C. §§ 251(c)(4), 252(d)(2), 251(b)(5).

require "nondiscriminatory access" to network elements. One of these FCC rules dealt with requests to incumbents to provide elements that were *already connected* in their networks; it prohibited incumbents from disconnecting those already-connected elements solely for the purpose of making it more difficult and expensive for competitors to use them. 47 C.F.R. § 51.315(b). The FCC concluded that this prohibition was compelled by the text of § 251(c)(3). *Local Competition Order* ¶ 293 ("section 251(c)(3) bars incumbent LECs [local exchange carriers] from separating elements that are ordered in combination"), Pet. App. 231a-232a. As the FCC observed, absent such a rule, new entrants "would be seriously and unfairly inhibited in their ability to use unbundled elements to enter local markets." *Id.*

Proceedings in the Eighth Circuit. As soon as the regulations were published, the incumbents (joined by various state utility commissions on some issues) challenged them. Pursuant to 28 U.S.C. § 2112(a)(3), the cases were consolidated in the Eighth Circuit. That court issued a decision on the merits on July 18, 1997, which it modified on rehearing on October 14, 1997. The court first held that the FCC lacked plenary authority to promulgate the regulations implementing the requirements of § 251. Although the 1996 Act expressly required that "[w]ithin 6 months . . . the Commission shall complete all actions necessary to establish regulations to implement the requirements of this section [251]," (47 U.S.C. § 251(d)(1)), the court held that this statutory command was "primarily a time constraint, directing the Commission to complete expeditiously its rulemaking regarding only the areas in section 251 where Congress expressly called for the FCC's involvement." Pet. App. 12a. The court also rejected the FCC's reliance on its comprehensive authority under § 201(b) of the Communications Act, 47 U.S.C. § 201(b), to "prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this Act," on the ground that § 201 authorized only regulation of common carriers

engaged in "interstate or foreign communication." Pet. App. 12a.[8]

Believing the FCC lacked plenary rulemaking authority, the court held that the FCC could implement only six specific narrow substantive requirements of § 251 where Congress had "expressly" mentioned particular attributes of the Commission's regulatory powers.[9] Outside these six areas *any* FCC action was held to be *ultra vires* because Congress intended for the States, not the FCC, "to dictate the substantive standards" necessary to implement the Act's federal requirements. Pet. App. 29a-30a. Chief among the many areas over which the FCC allegedly lacked jurisdiction is price. The court held that because of "[t]he absence of any direct FCC pricing authority over local telephone service," Pet. App. 13a, the FCC had violated the "plain meaning" of the Act in concluding that it could issue pricing regulations. Pet. App. 14a-15a & n.15.

The court held that the FCC's pricing regulations were also barred by § 2(b) of the original 1934 Communications Act, 47 U.S.C. § 152(b), which provides that "nothing in this chapter shall be construed to apply or to give the [FCC] jurisdiction with respect to . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communications service." The court of appeals described § 2(b) as a "fence that is hog tight, horse high, and bull strong, preventing the FCC from intruding on the states' intrastate turf," Pet. App. 23a, and concluded that even though the 1996 Act's

---

[8] For similar reasons, the court also concluded that the FCC could not use its traditional enforcement authority under § 208, to enforce *any* of the 1996 Act's local competition requirements in administrative complaint proceedings. Pet. App. 30a-34a.

[9] Pet. App. 12a & n.10. *See* § 251(b)(2) (number portability), § 251(c)(4)(B) (prevention of discriminatory conditions on resale), § 251(d)(2) (identification of network elements), § 251(e) (numbering administration), § 251(g) (continued enforcement of exchange access), and § 251(h)(2) (treatment of comparable carriers as incumbents).

pricing provisions clearly apply to intrastate services, Congress additionally needs to set out "an unambiguous grant of intrastate authority to the FCC [for it] either to jump over or pass through section 2(b)'s fence," Pet. App. 17a. The Eighth Circuit concluded that in the 1996 Act Congress acted in "exactly the opposite" manner, because "the Act directly and straightforwardly assigns to the states the authority to set the prices." *Id.*[10]

The Eighth Circuit then considered the substantive validity of the remaining rules it found to be within the FCC's jurisdiction. The court upheld many of the FCC's rules but struck down others as inconsistent with the Act's plain meaning.[11] The court initially upheld 47 C.F.R. § 51.315(b), the prophylactic rule barring incumbents from discriminating against new entrants by breaking apart existing combinations of network elements prior to providing them. On rehearing, however, the court invalidated § 51.315(b). In the court's view, when a competitor requests two network elements that are already combined, the incumbent is to "uncombine" them, and the competitors must then do the "actual [re]combining" of those elements. Pet. App. 52a-53a.

SUMMARY OF ARGUMENT

The court of appeals unlawfully vacated critical FCC regulations implementing the 1996 Act, which was enacted

---

[10] Relying on § 2(b) the court also vacated FCC regulations concerning exemptions for rural carriers, Pet. App. 30a; the FCC's jurisdiction to hear complaints concerning local competition issues under § 208, *id.* at 31a-32a; and the standards for reviewing interconnection agreements entered into before the effective date of the Act, *id.* at 34a.

[11] The court vacated as unreasonable or contrary to the Act's plain meaning the FCC's regulations implementing the 1996 Act's "pick and choose" provision, Pet. App. at 24a-27a; rules implementing the agency's interpretation of the preemptive effect of its own regulations, *id.* at 36a-40a; rules implementing the agency's interpretation of "the standards to determine which elements must be unbundled," *id.* at 46a; and rules implementing the agency's interpretation of the quality of access incumbents must provide to competitors, *id.* at 50a-52a.

to bring competition to monopoly local telephone markets as quickly as possible.

First, the court improperly vacated Rule 315(b), the FCC rule that protected new entrants from discriminatory treatment when they lease elements of the incumbent local telephone companies' telephone networks. That rule is a straightforward implementation of the requirement of § 251(c), imposing on incumbent monopolists the "duty to provide [to a new entrant] *nondiscriminatory* access to network elements on an unbundled basis."

The court erred in finding this rule inconsistent with the plain meaning of the word "unbundled" in § 251(c). The uniform dictionary definition of "unbundle" is "separately priced," *not* "physically disconnected," and that has also been the FCC's consistent historical understanding of the term. The Eighth Circuit's preferred definition also is irreconcilable with other provisions of § 251(c), including in particular that section's requirement of nondiscriminatory access to network elements. It was error under *Chevron U.S.A., Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837, 844 (1984), for the court to vacate Rule 315(b) on this ground. The policy rationales offered by the court of appeals in support of its unlawful construction of the statute are equally flawed, and show only how far the court departed from a reasonable interpretation of the statute and from the rule of judicial deference to reasonable agency actions. Point I.

Second, the court of appeals erred in concluding that the FCC lacked jurisdiction to issue regulations implementing the pricing provisions of the 1996 Act. In promulgating these regulations for interconnections and elements obtained under § 251, the FCC properly relied on its plenary authority to "establish regulations to implement the requirements of § 251," 47 U.S.C. § 251(d)(1), and to "prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this Act." 47 U.S.C. § 201(b). The court of appeals' conclusion that the FCC had no general authority to issue

regulations to implement the provisions of the 1996 Act was plain error, based on clear misreadings of the statutory text.

Believing the FCC to lack broad rulemaking authority, the court erroneously looked exclusively to the pricing provisions themselves to determine whether the FCC was given the authority to make rules establishing a pricing methodology. In concluding that the statute instead gave such jurisdiction exclusively to the states, the court failed to acknowledge that the state commissions' authority to set rates indicates nothing at all about the FCC's broader rulemaking authority to prescribe a pricing methodology. Nothing in § 252 of the Act limits the FCC's authority to make rules to implement the provisions of the 1996 Act. Point II(A).

Any other result would be inconsistent with the structure and purpose of the 1996 Act. As a result of the Eighth Circuit's invalidation of the regulations implementing the Act's pricing requirements, disputes over pricing methodology are being resolved piecemeal through drawn out litigation in the federal courts, delaying the onset of local competition that Congress sought to ensure. Denying the FCC the authority to address pricing also is flatly inconsistent with § 271 of the Act, which requires the FCC to determine whether local phone companies can begin to offer long-distance service in their regions. Section 271 specifies that the FCC must consider interconnection and element prices when it makes that determination. Ultimately, the court failed in its obligation to give the statute an interpretation that makes sense of its terms as well as its practical operation. Point II(B).

Finally, nothing in § 2(b) of the 1934 Communications Act supports the court's jurisdictional ruling. That provision states that nothing in the Communications Act should be construed to apply to intrastate matters or to give the FCC jurisdiction over those matters. But here, no construction is necessary: the 1996 Act plainly both applies to intrastate matters and gives the FCC jurisdiction over those matters. Moreover, § 2(b) ensures that the FCC

not assert preemptive ancillary jurisdiction over intrastate matters that Congress has left to the States. Here, Congress plainly has regulated intrastate telephone service and preempted state law, and the FCC has not regulated any further than Congress has legislated. Additionally, Congress intended that the interconnection agreements contain a single set of rates, terms, and conditions that apply without distinction to both interstate and intrastate services. Because separation of the intrastate aspects from the interstate aspects would be contrary to that congressional intent, § 2(b) is no bar to FCC regulation. Point II(C).

ARGUMENT

I. THE EIGHTH CIRCUIT'S DECISION INVALIDATING RULE 315(b) CONSTITUTED IMPROPER JUDICIAL POLICYMAKING IN CONTRAVENTION OF *CHEVRON*.

The Eighth Circuit's invalidation of Rule 315(b), 47 C.F.R. § 51.315(b), violates the "dominant, well-settled principle of federal law" requiring "judicial deference to reasonable interpretations by an agency of a statute that it administers." *National R.R. Passenger Corp. v. Boston & Maine Corp.*, 503 U.S. 407, 417 (1992).

Rule 315(b) implements § 251(c)(3) of the 1996 Act, which imposes on incumbents

> the duty to provide, to any requesting telecommunications carrier for the provision of a telecommunications service, nondiscriminatory access to network elements on an unbundled basis . . . on rates, terms, and conditions that are just, reasonable, and nondiscriminatory in accordance with the . . . requirements of this section and section 252. . . . An incumbent local exchange carrier shall provide such unbundled network elements in a manner that allows requesting carriers to combine such elements in order to provide such telecommunications service.

47 U.S.C. § 251(c)(3). In particular, Rule 315(b) implements § 251(c)(3)'s requirement of "nondiscriminatory access." The Rule provides that "[e]xcept upon re-

quest an incumbent LEC shall not separate requested network elements that the incumbent LEC currently combines." 47 C.F.R. § 51.315(b). *Local Competition Order* ¶ 293, Pet. App. 231a-232a.

As the FCC explained in detailed findings, *id.*, ¶¶ 289-341 (JA 550-76), Rule 315(b) anticipates and proscribes a blatant form of discrimination. For example, under the FCC's rules, a new entrant may lease from the incumbent the telephone wire (or "loop") that runs from a customer's house to the incumbent's switch, and the switch itself. In such cases, Rule 315(b) prohibits the incumbent from responding to such a request by separating the loop from its connection to the switch, thus forcing the competitor to reconnect the two elements(if it can), and interrupting the customer's phone service in the interim. Such disconnection of elements ordered in combination, if allowed, would add substantially to the costs of would-be competitors. By contrast, when an *incumbent* begins serving a local customer who has just moved into a house, *it* does not senselessly break apart the constituent parts of its network and then piece them back together prior to providing service—and thus does not bear any cost of "recombining" the elements into a finished service. It just enters new data in its computers. In promulgating Rule 315(b), the FCC simply placed the potential competitor in the same position as the incumbent, preventing the incumbent from exploiting its position as a monopoly vendor to favor itself by unilaterally imposing pointless and discriminatory costs on its rivals.

The Eighth Circuit nevertheless held that Rule 315(b) was contrary to the plain meaning of § 251(c)(3). The court read the statute's requirement that elements be provided on an "unbundled basis" as meaning that the incumbent is to provide the elements in separated form, and for that reason concluded that any requirement that incumbents provide elements in combination violated the statute.

As will be demonstrated, that ruling constituted a wholly inappropriate usurpation of the FCC's proper role

in interpreting and administering the unbundling requirements of § 251(c)(3). First, as the FCC concluded on the basis of detailed findings (that the Eighth Circuit did not so much as mention), Rule 315(b)'s antidiscrimination rule is not merely permitted by the text of § 251(c)(3)—it is compelled by that text. Second, in all events, the FCC's interpretation of § 251(c)(3) is surely a permissible one. *See Chevron*, 467 U.S. at 842-44. "Unbundling" means separate pricing, not physical separation —as multiple dictionary definitions, consistent prior regulatory usage of the term, and the structure and purposes of the 1996 Act all unequivocally show. And as the FCC's findings make clear, the Eighth Circuit's reading of the term is irreconcilably in conflict with § 251(c)(3)'s requirement of "nondiscriminatory access." Third, the policy rationale offered by the Eighth Circuit to support its decision—that permitting the imposition of such discriminatory costs is necessary to preserve a distinction between resale and the use of unbundled elements—represents wholly unsupported speculation and is in fact contradicted by unchallenged FCC findings.

A. Rule 315(b) Implements the Requirement of the Plain Language of the Statute to Provide Nondiscriminatory Access to Network Elements.

In the administrative record, the FCC explained in detail why Rule 315(b) is necessary to enforce the statutory mandate of nondiscriminatory access to network elements. *Local Competition Order* ¶¶ 289-341 (JA 550-76). The FCC determined that the language of § 251(c) requiring "nondiscriminatory access to network elements on an unbundled basis" "bars incumbent LECs from imposing limitations, restrictions, or requirements on requests for, or the sale or use of, unbundled [network] elements that would impair the ability of requesting carriers to offer telecommunications services in the manner they intend." *Id.* at ¶ 292, Pet. App. 230a-231a. Because "t[he] incumbent LECs have little incentive to . . . provision unbundled elements in a manner that would provide efficient competitors with a meaningful opportunity to compete," but

rather "have the incentive and the ability to engage in many kinds of discrimination," ¶ 307 (JA 55-56), the agency determined that "some national rules regarding nondiscriminatory access will reduce the costs of entry and speed the development of competition." *Id.* at ¶ 308 (JA 56).

The FCC then concluded that a rule prohibiting incumbents from discriminatorily separating elements that are already combined in its network was necessary to enable new entrants to make use of combinations:

> in practice it would be impossible for new entrants that lack facilities and information about the incumbent's network to combine unbundled elements from the incumbent's network without the assistance of the incumbent. If we [permit incumbents to separate combined elements and require requesting carriers to recombine them], we believe requesting carriers would be seriously and unfairly inhibited in their ability to use unbundled elements to enter local markets.

Id. at ¶ 293, Pet. App. 231a-232a (footnote omitted).

None of these findings has been challenged as unreasonable or unsupported by the administrative record. Thus, they must be accepted as conclusive here.

B. The Eighth Circuit Erred in Concluding That the Statutory Text Unambiguously Foreclosed the FCC's Interpretation of the Statute.

Even if the FCC erred in concluding that Rule 315(b) was *compelled* by the text of § 251(c)(3)—and it did not—the Eighth Circuit's decision to invalidate that rule still is wrong because the FCC's judgment is entitled to "controlling weight unless [it is] arbitrary, capricious or manifestly contrary to the statute." *Chevron*, 467 U.S. at 844; *Holly Farms Corp. v. NLRB*, 116 S. Ct. 1396, 1402 (1996) (agency interpretation must be upheld unless "inevitable construction" of statute precludes it). Moreover, because Congress expressly authorized the FCC "to prescribe legislative rules" implementing the 1996 Act's

substantive unbundling requirements, the Eighth Circuit "owe[d] the Commission's judgment more than mere weight or deference." *United States v. O'Hagan*, 117 S. Ct. 2199, 2217 (1997). As will be demonstrated, the FCC's judgment in this matter should have been conclusive.

The Eighth Circuit concluded that Rule 315(b) is contrary to law because § 251(c)(3) unambiguously "requires an incumbent LEC to provide access to the elements of its network only on an unbundled (as opposed to a combined) basis." Pet. App. 71a. To reach this conclusion, the Eighth Circuit interpreted the requirement in the first sentence of § 251(c)(3)—that incumbents have "[t]he duty to provide . . . access to network elements on an unbundled basis"—to mean that the incumbents' only obligation is to provide network elements in a *separated form*. The court then interpreted the second sentence of § 251(c)(3)—stating that incumbents must "provide such unbundled network elements in a manner that allows requesting carriers to combine such elements in order to provide . . . telecommunications service"—as meaning that potential competitors (not incumbents) are responsible for physically reconnecting the elements. Pet. App. 70a. But these are not "inevitable construction[s]" of the statutory text. To the contrary, the Eighth Circuit's construction of the statute is plainly wrong. *See Holly Farms*, 116 S. Ct. at 1402.

First, the incumbent's statutory "duty to provide . . . nondiscriminatory access to network elements on an unbundled basis" does not unambiguously mean that the incumbent has the right to separate its network into its constituent physical components and to provide each of those components only in *separated* form. To the contrary, as the FCC recognized, the dictionary definition of the term "unbundled" is "to separate the *charges* for (related products and services usually offered as a package)." *Random House Dictionary of the English Language*, p. 2005 (2d Ed. Unab. 1981) (emphasis

added).[12] The existence of multiple dictionary definitions supporting the FCC's interpretation alone is enough to overturn the Eighth Circuit's conclusion that the statutory text unambiguously foreclosed that interpretation. *See National R.R. Passenger Corp. v. Boston & Maine Corp.*, 503 U.S. at 418-19. Indeed, in the Notice of Proposed Rulemaking in this very proceeding the FCC relied on these dictionary definitions in proposing that "unbundled" be given its normal meaning of "separately available at a separate price," and the incumbents' trade association endorsed that definition.[13]

Moreover, the FCC's reading of "unbundled" is consistent with the FCC's uniform regulatory use of that term over the 15 years prior to passage of § 251(c)(3). When the FCC in 1980 provided for the "unbundling" of telephone sets from local service, that meant that telephone sets were to be *priced* separately from local service, so the customer would have the option of replacing the incumbent-supplied telephone with a telephone from another vendor, or of continuing to lease the phone from the incumbent at a separate price. Unbundling did not give the incumbent the right like the one that respondents now assert, to rip the phone from the customer's wall, forcing the customer to reconnect it.[14] Separate pricing was also the uniform interpretation given the term when the FCC unbundled the features used to provide computer-

related services, and other aspects of the network.[15] When Congress used the same term in the 1996 Act, it is presumed to have known of this well-established meaning. *See McDermott Int'l, Inc. v. Wilander*, 498 U.S. 337, 342 (1991).

The Eighth Circuit's reading of the term "unbundled" in § 251(c)(3) to mean "separated" also conflicts irreconcilably with the 1996 Act's definition of "network elements." (47 U.S.C. § 153(29)). As the appeals court recognized elsewhere in its opinion, network elements consist not only of the "physical parts" of an incumbent's network, but also of "features, functions, and capabilities" that do not correspond to individual, physically separate parts of the network. Pet. App. 42a-43a. For example, Congress expressly identified "signaling" as a network element. 47 U.S.C. § 153(29). But signaling is an electronic stream shared by all customers whose calls are routed through a particular switch. It cannot be "separated" from the switch without disrupting many of the calls being routed through the switch. When Congress commanded that signaling be "unbundled" as a discrete "network element," it cannot possibly have intended that signaling be separated from the rest of the network. Rather, it meant that signaling, as all other elements, be "priced separately."

Second, the Eighth Circuit's interpretation of the term "unbundled" is in conflict with the express requirement of § 251(c)(3) that new entrants be provided with "nondiscriminatory access" to network elements. As the FCC explained, forcing competitors to take network elements on a disassembled basis when they are already combined in an incumbent's network "would impose costs on competitive carriers that incumbent LECs would not incur,

---

[15] *Third Computer Inquiry*, 104 F.C.C.2d 958, 1064-66 (1986) ("unbundling" means that "competitors will pay only for Basic Service Elements that they use"), *vacated on other grounds, California v. FCC*, 905 F.2d 1217 (9th Cir. 1990); *Inside Wiring*, 59 Rad. Reg. 2d 1143, 1151-53 (1986), *aff'd, NARUC v. FCC*, 880 F.2d 422 (D.C. Cir. 1989).

and thus would violate the requirement under section 251(c)(3) that incumbent LECs provide nondiscriminatory access to unbundled network elements."[16] As the FCC noted, the text of § 251(c)(3) compelled the anti-discrimination rule it promulgated. *Local Competition Order*, ¶ 293, Pet. App. 231a-232a. The Eighth Circuit, however, made no effort to reconcile its ruling with the express nondiscrimination provision in the statutory text, and instead ignored the very premise of the FCC's decision to promulgate Rule 315(b). That was fundamental error. *Lexecon Inc. v. Milberg Weiss Bershad Hynes & Lerach*, 118 S. Ct. 956, 962 (1998); *John Hancock Mut. Life Ins. Co. v. Harris Trust and Sav. Bank*, 510 U.S. 86, 94-95 (1993) (courts must be "guided not by a single sentence or member of a sentence, but [by] look[ing] to the provisions of the whole law, and to its object and policy") (citation omitted). Because the Eighth Circuit's construction of the term "unbundled" cannot be harmonized with the statutory requirement of "nondiscriminatory access," it cannot possibly be the sort of "inevitable construction" necessary to overturn the agency's judgment.

This conclusion is not undercut by the second sentence of § 251(c)(3) which requires incumbents to "provide such unbundled network elements in a manner that allows requesting carriers to combine" them into a "telecommunications service." Indeed, that sentence supports the FCC's conclusion. The appeals court believed the "plain meaning" of this provision to be that new entrants have the obligation to put together that which the incumbents have taken apart. But this meaning is based on the assumption that "unbundling" and "combining" are antonymous terms connoting actions taken by an incumbent and a new entrant, respectively, to break apart and put back together the telephone network. The statute's text,

---

[16] *Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, Third Order on Reconsideration, 12 F.C.C.R. 12460, at ¶ 44 (1997), *petitions for judicial review pending on other grounds, U S West Inc. v. FCC*, Nos. 97-3576 et al. (8th Cir. filed Sept. 5, 1997) (JA 247).

however, does not purport to allocate responsibilities in this way. "Combine" plainly means that competitors can offer the elements to customers in combination with other elements, and the Act employs that term to forbid incumbents from artificially restricting the combinations, or uses, to which new entrants can put network elements.

In sum, the FCC's regulation is not "unambiguously foreclosed" by the text of § 251(c)(3), and the Eighth Circuit therefore erred in striking down the regulation. The regulation prohibits a form of "discriminatory access to network elements" and implements a statutory mandate expressly forbidding such discrimination. It is the Eighth Circuit that has misread the statutory text, and this Court should reinstate Rule 315(b).

C. The Eighth Circuit's Policy Rationale Is Insupportable.

What we have shown is sufficient to require reversal. In addition, there is no plausible policy justification for the Eighth Circuit's decision. That court adopted its strained reading of the statute to alleviate its concern over one permissible entry strategy. It feared that new entrants might lease all of the incumbent's network elements in combination at a lower cost than the cost of purchasing local telephone service for resale, thereby effectively "obliterat[ing] the careful distinctions Congress has drawn" between lease of network elements, and purchase of local telephone service at wholesale rates for "resale" to customers. Pet. App. 71a. Accordingly, the court concluded, without citing any record support, that it was necessary artificially to *raise* the cost of using network elements, so that leasing network elements would not become a less costly way to enter local markets than resale. *Id.* Imposing such burdens is especially necessary, according to respondents, because Congress created resale as an entry vehicle—and priced it in a particular manner—to serve policy objectives that supposedly need to be protected against encroachment by other forms of local competition.

For at least two reasons, this conflict is entirely manufactured.

First, as the FCC determined (again, in findings ignored by the Eighth Circuit), there is no risk of its anti-discrimination rule "obliterating" the distinction between these two different methods of entry, because the two routes of entry are economically quite distinct. *Local Competition Order* ¶¶ 332-334, Pet. App. 244a-246a. The Eighth Circuit's refusal to acknowledge the force of this argument in this context is especially perplexing, because elsewhere in its decision it affirms the right of new entrants to provide service through elements leased entirely from the incumbents, and acknowledges these very differences. Pet. App. 56a-57a.

As determined by the FCC, providers of service through combinations of elements face risks resellers do not. A reseller has a guaranteed margin that can be calculated in advance, because it simply purchases services its customers request, at a discounted rate. It faces no risk of unused capacity. A competitor that provides service through leasing combinations of unbundled network elements, in contrast, bears the risk that it will pay for elements to provide service, while its customers "will not demand a sufficient number of services using that facility for the carrier to recoup its costs." *Local Competition Order* ¶ 334, Pet. App. 245a-246a. A competitor using leased elements must also build internal systems the reseller does not need, to create, bill for and repair the network it builds out of the leased elements. The FCC found as a fact, on the basis of a voluminous record, that network elements and resale establish two entirely distinct modes of entry, and that neither undermines the viability of the other. Pet. App. 243a-244a. The Eighth Circuit had no business substituting its own uninformed understanding of the economics of local telephone competition for these findings of the expert agency.

Second, the court's assumption that there would be an "inherent" economic advantage in competing via combina-

tions of elements rather than resale was based on sheer speculation that lacks any support in the administrative record, and is wrong. The relative advantages and disadvantages of these entry vehicles are determined by any number of factors. Although at present the cost-based rates the Act requires for unbundled elements may impose costs on new entrants in many markets that are less than the wholesale rates provided by the Act's resale provision, that is principally because current resale rates reflect the absence of local competition. Once that competition emerges in earnest, retail rates (and by definition wholesale rates as calculated under the Act) can be expected to decline. In such circumstances there will be no reason to think that either entry vehicle will provide "inherent" cost advantages. Moreover, new entrants' current choices of entry vehicles may well be affected by other contingent factors. In particular, the FCC has authorized new entrants to compete in the market for exchange access—to collect access charges from long distance companies—when the new entrant uses unbundled elements. *Local Competition Order* ¶ 333, Pet. App. 244a-245a. Because those charges are today greatly above cost, new entrants will have strong incentives to compete using entry strategies that allow them to capture some of those revenues. Once those charges are brought into line with cost, as the FCC has announced it intends to do (*In re Access Charge Reform*, First Report and Order, 12 F.C.C.R. 15982 at ¶ 293 (1997)), that incentive will disappear. Thus, even if the Eighth Circuit were correct (and it is not), the court has imposed a permanent solution for what is at most a temporary problem.

In opposing *certiorari*, respondents proposed a separate policy rationale for the Eighth Circuit's campaign to "save" resale. They asserted that the invalidation of Rule 315(b) is necessary to preserve local telephone retail rate structures that contain implicit cross-subsidies benefitting rural residential customers at the expense of high-volume business customers. These so-called "universal service"

subsidies are preserved, the argument goes, when new entrants resell an incumbent's service, because the wholesale price of resold service is set at a discount off the retail price that reflects the implicit universal service subsidies. Because element prices are by law "cost-based," service through elements could lead to retail price competition and so pose a threat to these subsidies. Service through elements with its accompanying price competition therefore needs to be penalized in order to preserve the implicitly subsidized retail rates.

This argument could not be more at odds with the procompetitive letter and spirit of the Act. It ignores Congress' resolve in § 254 of the 1996 Act to *eliminate* the very implicit "universal service" subsidies the respondents would preserve, requiring that "any [universal service] support mechanisms . . . should be explicit, rather than implicit as many support mechanisms are today." [17] The very point of the 1996 Act was to replace a monopoly regime in which prices are set by regulators with a competitive market in which prices are set by market forces. In this new regime, universal service subsidies will be explicit. And Congress expressly commanded that all three forms of competitive entry (resale, facilities-based, and combinations of network elements) become available "as quickly as possible," [18] declining to make universal service reform a precondition for opening local markets to competition via *any* of these three entry strategies. The incumbents, in sum, are arguing that the 1996 Act should be interpreted to protect the very implicit subsidies which Congress sought to extirpate. Their complaint is with the Congress, and not the FCC.

At bottom, both the Eighth Circuit and the respondents fundamentally misconstrue the 1996 Act, which is designed to allow market forces, and not regulators or appellate courts, to dictate to the greatest extent possible the course of competition. The FCC concluded that Congress

---

[17] H.R. Conf. Rep. No. 104-458 at 131 (1996) ("Conf. Rep.").

[18] H. Rep. at 89.

did not "express[] a preference for one particular entry strategy," but created alternative paths new entrants could employ "as market conditions and access to capital permit." *Local Competition Order* ¶ 12, Pet. App. 137a-138a. Before the invalidation of Rule 315(b), a new entrant could use one or another entry strategy depending on its cost and the entrant's evaluation of the relative economic potential and risk associated with being an owner, a reseller, or a lessor. The Eighth Circuit's decision to handicap one of these strategies to further a postulated policy objective in the end serves only to compel market participants to compete through inefficient means, or not to compete at all. In this regard, Congress and the FCC understood what the court below did not—that it is bad policy to require competitors to dig up roads to lay down unnecessary phone lines because a regulator has imposed unnecessary costs upon what would otherwise be the rational economic choice to lease the existing lines from the incumbent. And it is contrary to the law for a court to foist this bad policy choice on market participants by contravening the far more sensible policy judgment of the expert agency in which Congress vested the power to make such judgments. *Chevron* dictates that the ruling of the Eighth Circuit be reversed.

II. CONGRESS GRANTED THE FCC PLENARY AUTHORITY TO ISSUE RULES IMPLEMENTING ALL LOCAL COMPETITION REQUIREMENTS OF THE 1996 ACT, INCLUDING ITS PRICING REQUIREMENTS.

The FCC possesses statutory authority to issue regulations implementing all requirements of § 251, including its pricing requirements. The text of both the 1996 Act and the original Communications Act unambiguously confer such authority, and the structure and purposes of the 1996 Act confirm its existence. The Eighth Circuit's decision to strip the FCC of much of that authority has wreaked havoc with the practical operation of the 1996 Act, and has created an incoherent jurisdic-

tional scheme that cannot be justified on federalism grounds or any other.

A. The Statutory Text Unambiguously Grants the FCC Plenary Authority to Implement All Local Competition Requirements of the 1996 Act.

Congress unambiguously gave the FCC the authority to implement all requirements of the 1996 Act. In reaching the contrary conclusion, the Eighth Circuit fundamentally misconstrued the statutory text. It held that the FCC's pricing rules were unlawful because Congress had not authorized the FCC "*specifically* to issue rules governing . . . rates." Pet. App. 12a (emphasis added). But there was no need for such a specific grant of authority because Congress granted the FCC plenary authority to implement all of § 251's requirements. Th[illegible], the fact that the 1996 Act does not contain any language specifically authorizing the FCC to issue pricing regulations (or for that matter any other specific category of regulations) proves nothing.

1. The grant of implementing authority contained in the 1996 Act is straightforward. Section 251(d)(1) authorizes the FCC to "complete *all actions necessary* to establish regulations *to implement the requirements of this section*" within 6 months of the date of enactment. 47 U.S.C. § 251(d)(1) (emphasis added). Section 251 contains the express pricing requirement that rates for interconnection and access to unbundled elements be "just, reasonable, and nondiscriminatory, in accordance with . . . the requirements of this section and [§] 252," which in turn requires that such rates be "based on . . . cost." 47 U.S.C. §§ 251(c)(2), (c)(3), 252 (d)(1). Nothing in the statutory language forbids the FCC from issuing regulations implementing those requirements. Thus, § 251 (d)(1) gives the FCC authority to implement all requirements of § 251, including its pricing requirements.

Even apart from § 251(d)(1), the general rulemaking provisions of the original Communications Act provide

alternative sources of authority sufficient to justify the FCC's pricing rules. Section 201(b) of the Communications Act authorizes the FCC to "prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this Act." 47 U.S.C. § 201(b). The 1996 Act amended the Communications Act, adding §§ 251 and 252 to that Act. *See* 110 Stat. 61 (1996). Because §§ 251 and 252 are now "provisions of this Act," and Congress did not amend § 201(b) to restrict the FCC's rulemaking authority in any way, this provision plainly authorizes the FCC to issue rules implementing § 251.[19]

The Eighth Circuit's refusal to give effect to these statutory provisions is insupportable. It is not plausible to assert—as the Eighth Circuit did—that § 251 is only a time limit and not a grant of authority, when it is literally both.[20] Nor is there merit to the Eighth Circuit's holding that § 201(b), which authorizes the FCC to carry out all provisions of the Act, applies only to interstate matters. Although the first sentence of § 201(b) does deal with interstate matters, the grant of rulemaking authority is not so confined. The last sentence of § 201(b) grants the FCC authority to implement all provisions of "the Act," not merely the provisions of § 201. It may be that when originally enacted, that statutory language had the effect

---

[19] Two other provisions—§ 4(i) and § 303(r)—likewise authorize the FCC to implement *all* of Chapter 5 of the Act, which now includes §§ 251 and 252. 47 U.S.C. § 154(i) ("The Commission may . . . make such rules and regulations, and issue such orders, not inconsistent with this chapter, as may be necessary in the execution of its functions"); 47 U.S.C. § 303(r) (the Commission shall "[m]ake such rules and regulations and prescribe such restrictions and conditions, not inconsistent with law, as may be necessary to carry out the provisions of this Act").

[20] *See Krauel v. Iowa Methodist Medical Ctr.*, 95 F.3d 674, 677 (8th Cir. 1996) (noting EEOC authority to issue regulations implementing the ADA under 42 U.S.C. § 12116, which provides that "[n]ot later than 1 year after July 26, 1990, the Commission shall issue regulations in an accessible format to carry out this subchapter").

of conferring only interstate rulemaking authority, but that is because the substantive provisions of the 1934 Act applied only to interstate matters. As the Act's substantive scope expanded, the rulemaking authority conferred by § 201(b) necessarily expanded with it. That is the plain meaning—indeed, it is the inevitable meaning—of the statutory text. This is hardly a surprising result: administrative agencies are typically granted rulemaking authority coextensive with the substantive scope of the organic statute they are charged with administering.

The Eighth Circuit's construction of these provisions leads directly to an absurd result—the absence of *any* source of authority for the FCC to implement *any* of the 1996 Act's local competition provisions. That cannot be correct because, as the Eighth Circuit recognized, several provisions of the 1996 Act "expressly called" for FCC involvement. *See* Pet. App. 12a n.10 (citing provisions). But those provisions do not themselves supply the kind of specific and unambiguous grant of rulemaking authority the Eighth Circuit held was required. Those provisions are not *grants* of authority at all. They are, rather, *limitations* on the FCC's authority, *see, e.g.*, § 251(d)(2) ("[i]n determining what network elements should be made available . . ., the Commission shall consider"), or on the States' authority, *see* § 251(c)(4)(B) ("a State commission may, consistent with regulations prescribed by the Commission"). The provisions on which the Eighth Circuit relied *presuppose* the existence of FCC rulemaking authority—and thus confirm that it must have been conferred by some other provision of the Act. *See NationsBank v. Variable Annuity Life Ins. Co.*, 513 U.S. 251, 258 (1995) (existence of statutory limitation on grant of authority "presupposes" existence of that authority, and "makes sense only if" authority is elsewhere conferred).

2. Because the statutory text confers plenary rulemaking authority, the FCC's pricing rules must be upheld unless some other provision of the 1996 Act expressly limits that authority. The Eighth Circuit purported to

find such a limitation in § 252(c)(2), which instructs state commissions to "establish . . . rates according to [252(d)]." *See* Pet. App. 14a. ("the Act plainly grants the state commissions, not the FCC, the authority to determine the rates involved in the implementation of the local competition provisions of the Act"). Indeed, the Eighth Circuit concluded that the "plain language" of § 252 denied the FCC any authority to issue pricing regulations. *Id.* at 10a-14a.

Section 252 does no such thing. It merely grants to state commissions the authority to "establish" actual rates to govern particular interconnection agreements. But establishing actual rates and prescribing a pricing methodology are two different things. The former is an adjudicatory task, the latter a prescriptive one. By no stretch of language or logic does giving each State the task of applying Federal rules in a concrete factual context negate the FCC's authority to prescribe general rules for States to apply in carrying out their assigned role. Thus the "plain language" of § 252 does not eliminate the FCC's authority to prescribe rules implementing § 251's pricing requirements.

In truth, the Eighth Circuit's decision rests not on the "plain language" of the 1996 Act, but on a negative inference drawn from what the Eighth Circuit mistakenly believed was legislative silence. Believing wrongly that Congress gave the FCC no plenary rulemaking authority, the appeals court assumed the task of making *ad hoc* judgments about each requirement of § 251, assigning principal implementing responsibility to the FCC or to the States depending on whether the statutory text appeared to contemplate FCC or state action. The court thought it critical that "the absence of any reference whatsoever to the FCC in the sections of the Act that directly authorize the state commissions to establish prices confirms to us that Congress did not envision the FCC's participation in determining [prices]." Pet. App. 13a. But once §§ 251(d)(1) and 201(b) are properly recognized as

affirmative grants of rulemaking authority, the purported negative inference arising from § 252(c)(2) loses all its force. *See Field v. Mans*, 516 U.S. 59, 67-68 (1995) (negative inference from legislative silence "should not be elevated to the level of interpretive trump card," particularly where it would yield "odd" results).

This Court made precisely the same point in its recent decision in *Lexecon*, 118 S. Ct. at 962. In assessing the nature of the obligation of the Judicial Panel on Multidistrict Litigation to remand a previously transferred case back to its original jurisdiction for trial, the Court rejected the argument that the absence of any mention of the Panel's obligation in § 1407(b) trumped the explicit assignment of that obligation in § 1407(a). Noting that "a statute is to be considered in all its parts," this Court reasoned that:

> to emphasize that § 1407(b) says nothing about the Panel's obligation when addressing a transferee court's powers is simply to ignore the necessary consequence of self-assignment by a transferee court: it conclusively thwarts the Panel's capacity to obey the unconditional command of § 1407(a).

Id. at 962. Similarly, to emphasize that § 252(c)(2) says nothing about the FCC's authority to establish a pricing methodology "conclusively thwarts" the FCC's ability to exercise the authority conferred by §§ 251(d)(1) and 201(b).

More fundamentally, however, § 252 is not silent: it expressly instructs state commissions to resolve "any open issue" in arbitrations in accordance with "the requirements of section 251 of this title, *including the regulations prescribed by the Commission pursuant to section 251.*" 47 U.S.C. § 252(c)(1) (emphasis added). The question of what pricing methodology to use in establishing rates in a § 252 adjudication is plainly one such "open issue." Congress did not need to repeat that instruction when, in the immediately following subsection, it authorized state commissions to "establish" the actual rates. 47

U.S.C. § 252(c)(2). Thus, there is no basis in the statutory text for concluding that Congress intended to deny the FCC authority to implement the pricing requirements of § 251.[21]

3. The legislative history of the 1996 Act confirms what the text makes plain. The bills passed by both houses of Congress indisputably granted to the FCC authority to implement all of the Act's local competition requirements, including its pricing requirements. The House bill expressly instructed the FCC to "establish regulations to implement the requirements of this section," and made specific mention of pricing requirements. H. Rep. at 143, §§ 242(b)(4)(A), (C). In the Senate version, the substantive provisions that are now divided between § 251 and § 252 were contained in a single section, which also included a provision instructing the FCC to "implement the requirements of this section." S. Rep. at 93, § 251(i)(1).[22] In reconciling the relevant provisions of these two bills, the Conference Committee made quite clear that it intended no substantive changes: the Confer-

---

[21] At a minimum, §§ 251 and 252 do not convey an "unambiguously expressed intent" on the part of Congress to deny the FCC authority to implement § 251's pricing requirements. *See Holly Farms Corp.*, 116 S. Ct. at 1407 (O'Connor, J., concurring in part, dissenting in part) (*quoting Chevron*, 467 U.S. at 842-43). Thus, the Eighth Circuit was wrong to conclude on this basis that it did not owe the FCC's interpretation of the 1996 Act any deference. *See generally Chevron*, 467 U.S. at 842-46; *Mississippi Power & Light Co. v. Mississippi ex rel. Moore*, 487 U.S. 354, 382 (1988) (Scalia, J., concurring) (*Chevron* deference extends to agency's determination of the scope of its own authority). Indeed, the Eighth Circuit was wrong as a matter of law in concluding that the mere "absence of any FCC pricing authority" (Pet. App. 13a) constituted the kind of clear Congressional statement necessary to override an agency's interpretation of its authority. Under *Chevron*, when a statutory provision is "silent or ambiguous with respect to [a] specific issue," reviewing courts must defer to any reasonable agency interpretation. 467 U.S. at 843.

[22] The Senate bill also directed state commissions to comply with the FCC's regulations in conducting arbitrations. S. Rep. at 91-92, § 251(d)(5)(A), (D).

ence report states that where no change was noted, no substantive change was intended,[23] and that report nowhere suggests any intent on the part of Congress to take away from the FCC any of the implementing authority each House of Congress had given it. *See Mead Corp. v. Tilley*, 490 U.S. 714, 723-24 (1989) (where conference committee noted differences between final version of statute and predecessor bills, it is reasonable to assume that had committee intended a change to be substantive, it would have discussed it); *Union Elec. Co. v. EPA*, 427 U.S. 256, 262-63 (1976). Moreover, there is no reason to think the Conference Committee intended to reduce radically the scope of the FCC's jurisdiction in light of the Senate rule forbidding Conferees from eliminating matters agreed to by both Houses. *See* Standing Rules of the Senate, 104th Cong., Rule XXVIII, c. 2.

B. The Eighth Circuit's Decision to Strip the FCC of Authority to Issue Pricing Regulations Is Utterly at Odds With the Structure and Purposes of the 1996 Act.

The structure and purposes of the 1996 Act also compel the conclusion that Congress granted the FCC authority to implement all of § 251—including its pricing requirements. The 1996 Act does more than merely commit the nation to a policy of competition in local telephone markets. It also establishes a process designed to open local markets as quickly as possible, and to manage an orderly transition to Bell Company participation in long distance markets. Granting the FCC authority to implement the Act's pricing requirements is fully consistent with this process because it ensures rapid and uniform national execution of Congress' objectives. Stripping the FCC of that authority, in contrast, stands as a serious obstacle to the

---

[23] *See* Conf. Rep. at 113 ("The differences between the Senate bill, the House amendment, and the substitute agreed to in conference are noted below, except for clerical corrections, conforming changes made necessary by agreements reached by the conferees, and minor drafting and clerical changes.").

practical operation of the process set forth in the 1996 Act.

1. The essential outlines of the Congressional plan are clear on the face of the statute:

First, uniform substantive federal law now governs competitive relations in local service, displacing the prior state regimes which were (with a few exceptions) antithetical to local competition. The basic federal requirements have been announced by Congress, are to be implemented in detailed regulations by the FCC, and are ultimately to be enforced by federal district courts with exclusive jurisdiction to ensure that state commissions have met the requirements of §§ 251 and 252 and implementing FCC regulations.

Second, speed is critical. The 1996 Act is replete with action-forcing deadlines—most importantly the requirement that the FCC issue its regulations within six months of the Act's passage. Congress made clear that it wanted national rules in place before the § 252 arbitration process was underway, in order to narrow the range of issues subject to legal dispute and to rein in the incumbents' natural incentives to obstruct the process:

> it is important that the *Commission rules to implement new section 251* be promulgated within 6 months . . . so that potential competitors w[ould] have the benefit of being informed of the Commission['s] rules in requesting access and interconnection.

Conf. Rep. at 148-49 (emphasis added). Additionally, the substantive validity of the FCC's rules could be settled quickly, in a single proceeding before a single federal court of appeals.

Third, States play a critical role in implementing the new federal policy, but a role that differs fundamentally from that of the federal government. Federal authorities announce the law; States apply it. Congress permitted States to assume that role for two obvious reasons: (i) by virtue of their long history of regulating local service,

state authorities have the factual knowledge needed to translate the new federal requirements into action; and (ii) permitting the States to assume this responsibility will bring about competition much faster than would the alternative of assigning this responsibility to the FCC, which would have been administratively overwhelmed by an effort of this magnitude.

Fourth, the FCC's responsibility under § 271 of the 1996 Act to decide whether the Bell Companies can enter long distance markets in their region is inextricably linked to the FCC's responsibility to implement the Act's local competition provisions. The FCC may not grant such authority to a Bell Company unless the FCC finds, *inter alia*, that the Bell Company has met the requirements of § 251.

2. By stripping the FCC of pricing authority, the Eighth Circuit has scuttled the coherent regulatory approach created by Congress and replaced it with an incoherent jurisdictional scheme in which authority is dispersed among the FCC, state commissions, and federal courts without any rhyme or reason—thereby "frustrat-[ing] the statute's practical operation as well as its formal command." *See Oubre v. Entergy Operations, Inc.*, 118 S. Ct. 838, 842 (1998).

a. The Eighth Circuit's decision has made it far more difficult to bring competition to local markets "as quickly as possible." *See* H. Rep. at 89 (action within 15 months thereafter). As a result of the Eighth Circuit's action, uniform national pricing rules were not in place to govern the onslaught of § 252 arbitrations that followed passage of the 1996 Act. The Eighth Circuit thus opened the door to what Congress had acted to prevent: state-specific trench warfare over the meaning of the Act's pricing requirements. Dozens of cases are now pending across the country in federal district courts, challenging the pricing determinations of state commissions as inconsistent with the requirements of § 251. If the Eighth Circuit's decision is not reversed, this trench warfare will persist

for years. Once the federal courts of appeals (and perhaps this Court) have settled on a uniform meaning of the Act's pricing requirements, the inevitable result will be invalidation of some state decisions, requiring those States to revise fundamental assumptions years after initial determinations have been made. Not only will this process waste substantial resources, it promises tremendous delay in the introduction of actual competition, as competitors wait for federal courts to sort through the Act before making (or resuming) the multi-billion dollar investments necessary to compete meaningfully in local markets.

b. In addition, the Eighth Circuit's jurisdictional ruling cannot be reconciled with the plain text of § 271 of the 1996 Act—the provision governing whether Bell Companies will be permitted to provide interstate long-distance service to customers in their regions—and undermines coherent administration of that provision. Section 271 specifically vests the FCC with the authority to decide when a Bell Company should be permitted to enter the long distance market in its home region. In making that determination, the FCC must "find" that the Bell Company has satisfied all requirements of § 271's "competitive checklist," which is designed to test whether its local market has become competitive. § 271(d)(3). The checklist expressly includes many of the requirements of § 251, including its pricing requirements. § 271(c)(2)(B). As the D.C. Circuit recently explained, the FCC must find "to its own satisfaction" that the statutory requirements are met, because "Congress has clearly charged the FCC, and *not the State commissions*, with deciding the merits of the [Bell Companies'] requests for interLATA authorization." *SBC Communications Inc. v. FCC*, 1998 WL 121492 at *6. Thus, the Eighth Circuit has denied the FCC the authority to issue regulations prescribing a pricing methodology sufficient to satisfy the requirements of § 251(c)(3), even though the plain text of § 271 directs the FCC to reject an application for long distance authority if it determines that the prices set by a State do not satisfy the requirements of § 251(c)(3).

The Eighth Circuit has, of course, sought to square the circle by issuing a mandamus order denying the FCC the very authority that the text of § 271 (and the recent D.C. Circuit decision) insist the FCC must exercise respecting pricing issues. *See* Order on the Motions (JA 284-301) (FCC must "confine its pricing role under [§] 271(d)(3)(A) to determining whether applicant [Bell Companies] have complied with the *pricing methodology and rules adopted by the state commissions and in effect in the respective states in* which such [Bell Companies] seek to provide in-region, interLATA services") (emphasis added). That ruling (which is the subject of a separate petition for certiorari) cannot be correct. Although the Eighth Circuit has tied the FCC's hands respecting state pricing determinations, federal courts are free to invalidate state pricing determinations that the Eighth Circuit has forced the FCC to accept in adjudicating § 271 applications—thus creating the possibility of genuine chaos in the long distance market, as the FCC is forced (by judicial decisions in § 252 cases invalidating state pricing decisions) to revoke long distance authority it previously was forced to grant as a result of the Eighth Circuit's ruling. Similarly, the D.C. Circuit in reviewing an FCC decision under § 271 would presumably be free (as the FCC, according to the Eighth Circuit, is not) to disagree with the State's pricing determination in deciding whether a Bell Company had met the statutory standards for obtaining long distance authority. Congress cannot possibly have intended such chaos. That the Eighth Circuit would be driven by the logic of its original decision to such an implausible and impractical conclusion about the FCC's § 271 authority is a powerful indicator that the original decision is wrong.

c. The Eighth Circuit's decision is also impossible to reconcile with a host of other provisions in the Act. It cannot, for example, be squared with § 410, 47 U.S.C. § 160, which grants the FCC the authority to forbear from enforcing any regulation or provision of the Act (relating *inter alia* to "charges")—including the pricing

provisions of § 251(c). Congress has given the FCC the power to suspend enforcement of the requirements of § 251(c)—including its pricing requirements—if the FCC decides those requirements have been fully implemented, and are no longer necessary to promote competition or protect the public interest. 47 U.S.C. §§ 160(a)(1), (d). In order to exercise that authority, the FCC must necessarily decide what the pricing requirements of § 251 mean. Once the FCC makes such a decision, a State is forbidden from continuing to enforce those requirements. *Id.* § 160(e). It would have been entirely capricious to deny the FCC authority to issue regulations implementing those requirements in the first instance.

Nor can the Eighth Circuit's ruling be squared with the plain text of § 208, which gives the FCC authority to adjudicate complaints by "[a]ny person . . . complaining of anything done or omitted to be done by any common carrier subject to this Act, in contravention of the provisions thereof." 47 U.S.C. § 208. Indeed, much as it did with § 271, the Eighth Circuit had to ignore the plain language of the statute in order to vindicate its view of the proper scope of FCC authority. *See* Pet. App. 30a-34a (holding that FCC may not consider § 208 complaints alleging violations of § 251). *But see* § 252(d)(3) ("in prescribing and *enforcing* rules to implement the requirement of this Section. . . .") (emphasis added). And the Eighth Circuit did not explain how its ruling could be squared with § 253 of the 1996 Act, which authorizes the FCC to preempt any state-set requirement (including pricing requirements) that effectively prohibits entry into intrastate markets.

3. The Eighth Circuit's construction of the 1996 Act must be rejected because it destroys the prospects for coherent national administration of the Act and, by haphazardly dispersing decisional authority under the Act, "would yield an incoherent jurisdictional scheme." *See Bank One Chicago v. Midwest Bank & Trust Co.*, 516 U.S. 264, 275 (1996) (rejecting interpretation of § 4010 of Expedited Funds Availability Act because it would

randomly disperse authority for deciding related claims among state and federal agencies and courts). Under the Eighth Circuit's approach, the FCC has the authority to implement some substantive requirements of § 251 (such as deciding what network elements should be unbundled). States must follow those FCC implementing regulations when adjudicating disputes pursuant to § 252, and are subject to federal court review to ensure conformity with the FCC's rules. However, for other substantive requirements of § 251—including the critical pricing requirements—States are now free, in the first instance, "to dictate the substantive standards" that will apply, Pet. App. 30a. No coherent rationale exists for why Congress would have chosen the distribution of jurisdictional authority resulting from the Eighth Circuit's decision.

In view of all the adverse consequences flowing from the Eighth Circuit's decision—the delay and uncertainty it is causing, its incompatability with §§ 271, 410, 208 and 253, and its incoherent allocation of jurisdictional responsibilities—that decision simply cannot be a correct reading of the 1996 Act.

4. This litany of adverse consequences cannot be justified on the only ground thus far offered—federalism. At bottom, the Eighth Circuit appeared to believe its ruling was necessary to protect the States' traditional regulatory authority over intrastate telecommunications matters. But States had such authority as a result of a decision *by Congress* in 1934 to allocate regulatory responsibility in that way. There can be no question, however, that Congress has sufficient authority under the Commerce Clause to regulate intrastate telecommunications services, and the 1996 Act represents an unambiguous decision on the part of Congress to preempt traditional state laws restricting competition in local markets. Section 251 prescribes comprehensive substantive federal requirements governing carrier-to-carrier relationships in the intrastate market. Moreover, Congress indisputably gave the FCC authority to prescribe binding national rules governing many important requirements of § 251, including all of its substantive unbundling

requirements and many of the resale requirements of § 251(c)(4). FCC rules in these areas govern intrastate matters fully as much as did the pricing rules invalidated by the Eighth Circuit. Indeed, Congress has gone even further, expressly preempting all state laws restricting competition in local markets (§ 253), and mandating an end to the old regime of hidden subsidies associated with monopoly rate-of-return regulation (§ 254). A plausible defense of the Eighth Circuit's decision therefore cannot rest on broad brush invocations of federalism. It must instead explain why Congress would have chosen to deny the FCC authority to implement one critically important subset of nationally uniform federal requirements under § 251 while granting the FCC authority to implement other important requirements contained in the same provision, and granting the federal courts (while denying state courts) the power to review even the provisions initially assigned to the States. No such explanation has even been attempted.

Nor is there a plausible case to be made that Congress simply decided to leave the critical question of pricing methodology to the States' discretion. To begin with, the legitimacy of any such delegation of federal substantive authority would be suspect. Congress may of course delegate such authority to federal agencies, but only because they are supervised by the President and thus accountable to the national electorate. State agencies lack that political accountability. *See Printz v. United States*, 117 S. Ct. 2365, 2378, 2381 (1997) (unlawful to transfer federal executive power to "the 50 States, who are left to implement the program without meaningful Presidential control"); *Bowsher v. Synar*, 478 U.S. 714, 733 (1986) ("[i]nterpreting a law enacted by Congress to implement the legislative mandate is the very essence of 'execution' of the law"). Indeed, that is why federal courts do not accord *Chevron* deference to state agency interpretations of ambiguous provisions of federal law,[24] and have uni-

[24] *See, e.g., AMISUB v. Colorado Dep't of Social Services*, 879 F.2d 789, 795-96 (10th Cir. 1989); *Turner v. Perales*, 869 F.2d 140, 141 (2d Cir. 1989).

formly rejected such deference in adjudicating cases pursuant to § 252(e)(6) of the 1996 Act.[25] Moreover, Congress' decision to vest federal courts with exclusive jurisdiction to ensure that state commissions have complied with the requirements of § 251 is a powerful indication that Congress intended uniform national interpretations of those requirements.

For all these reasons, the Eighth Circuit erred in concluding that Congress intended in the 1996 Act to deny the FCC authority to issue nationwide regulations establishing pricing methodologies.

C. Section 2(b) of the 1934 Act Does Not Deny the FCC the Authority to Issue Rules Implementing the Pricing Requirements of the 1996 Act.

The Eighth Circuit's invalidation of the FCC's pricing rules cannot be sustained on the alternative ground that it is compelled by § 2(b) of the 1934 Act, 47 U.S.C. § 152(b). Relying on § 2(b) and this Court's preemption decision in *Louisiana Public Service Commission v. FCC*, 476 U.S. 355 (1986), the Eighth Circuit concluded that the FCC lacked jurisdiction over intrastate matters unless the Communications Act "*both* unambiguously appl[ied] to intrastate telecommunication matters *and* unambiguously direct[ed] the FCC to implement its provisions." Pet. App. 19a (emphasis in original). In the Eighth Circuit's view, because the 1996 Act did not "unambiguously direct" the FCC to implement its provisions, and because no other exception to § 2(b) was applicable, the FCC had no jurisdiction to prescribe regulations implementing many of the substantive provisions of the 1996 Act, including those involving pricing.

That holding is indefensible. Even under the Eighth Circuit's restrictive approach, § 2(b) does not preclude

---

[25] *See, e.g., US West v. MFS Intelnet*, No. C97-222WD, Order on Motions for Summary Judgment (W.D. Wash. Jan. 7, 1998); *US West v. Hix*, No. 97-D-152, Memorandum Opinion and Order (D. Colo. Dec. 5, 1997).

the FCC's assertion of jurisdiction under the 1996 Act, because the Act "straightforward[ly]" and "unambiguous[ly]" *both* applies to intrastate matters *and* gives the FCC jurisdiction over those matters. More important, the Eighth Circuit misunderstood the nature of § 2(b). That section simply limits the FCC's *ancillary* jurisdiction over intrastate matters not governed by substantive federal law; it has no role when, as here, a provision of the Act indisputably applies to intrastate matters. The court's contrary interpretation was based on a fundamental misreading of *Louisiana Public Service Commission v. FCC*, 476 U.S. 355 (1986). *Louisiana* addressed whether the FCC had ancillary jurisdiction to preempt state laws governing certain aspects of intrastate services; *Louisiana* is thus inapplicable to this case, in which Congress has plainly preempted state law, and the only question is whether the FCC or the state commissions will have authority to implement the federal law. Finally, the Eighth Circuit's decision must be reversed because that court misapplied § 2(b)'s "inseverability" exception. *See Louisiana*, 476 U.S. at 375 n.4.

1. All that § 2(b) creates is a rule of construction—a presumption—that the Communications Act does not apply to, and that the FCC lacks jurisdiction over, intrastate matters. The presumption governs, of course, only in the absence of congressional intent to the contrary. *See Louisiana*, 476 U.S. at 377. When Congress in an "unambiguous" or "straightforward" manner demonstrates either an intent to reach intrastate communications service or to give the FCC jurisdiction over such service, § 2(b)'s rule of construction simply has no application.[26]

Here, Congress has done both. As demonstrated, *see supra* pp. 4-7, 34, and as the Eighth Circuit acknowledged, §§ 251 and 252 "clearly apply to intrastate telecommuni-

---

[26] This rule is consistent with the well-established rule that a more specific statute controls a more general one. *See, e.g., Morales v. Trans World Airlines, Inc.*, 504 U.S. 374, 384 (1992).

cation service." Pet. App. 19a. Indeed, one of the principal purposes of the 1996 Act was to open to competition local—*i.e.*, intrastate—telephone service, and the provisions of the Act unambiguously implement that purpose.[27] As we have also demonstrated above, it is equally clear that the 1996 Act provides in a straightforward and unambiguous manner for FCC jurisdiction to implement these federal statutory provisions. Section 251(d)(1) expressly empowers the FCC to issue regulations "to implement the requirements of this section." And § 201 of the Communications Act provides unambiguously and without limitation that "[t]he Commission may prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this Act." Clearer congressional authorization for FCC action can hardly be imagined. *See* Part II(A). Thus, even under the Eighth Circuit's dual test—requiring both explicit coverage in federal legislation *and* explicit authorization of FCC regulations—the § 2(b) presumption is overcome.

2. Moreover, the Eighth Circuit misunderstood the requirements of § 2(b). Although the Eighth Circuit conceded that the 1996 Act created uniform *federal* standards to govern pricing and other aspects of intrastate services, it concluded that the FCC lacked jurisdiction to issue regulations implementing those standards, because the FCC allegedly had not received "unambiguous direction" from Congress. That conclusion is inconsistent with the text and history of § 2(b) and is not required by any precedent of this Court.

The Eighth Circuit's faulty conclusion about the need for "unambiguous direction" arose largely from its misreading of *Louisiana*, which it viewed as standing for the proposition that "section 2(b) 'fences off' intrastate matters from FCC regulation." Pet. App. 15a. In *Louisiana*,

---

[27] *See, e.g.*, § 251(c)(2) (interconnection to local network facilities), § 251(c)(4) (resale of local telephone service); § 251(c)(3) (access to the unbundled elements of the local network); § 252 (framework for generating agreements between incumbent LECs and new entrants); § 254 (universal service).

the Court faced the quite different question whether the FCC had the power to issue depreciation regulations that preempted contrary requirements established under state law for intrastate service. *See* 476 U.S. at 358. The statutory provision at issue, § 220(b) of the Act, provided that the Commission "shall . . . prescribe" regulations governing the treatment of depreciation by common carriers. *Id.* at 366. There was thus no question that the statute applied to—and that the FCC had jurisdiction to regulate—depreciation rates for *interstate carriers.* The statute, however, made no reference to *intrastate* matters, and did not otherwise contain clear indications that such matters were within the statute's purview. The Court's conclusion that, against the background of § 2(b), the FCC had not been clearly granted the power to preempt contrary state depreciation schedules with respect to intrastate rates was, therefore, a rejection of the FCC's exercise of *ancillary* jurisdiction, *i.e.*, the FCC's jurisdiction over matters to which the Act did not directly apply. *Id.* at 371-73. The Court's decision did not at all address the issue presented here—namely, whether the FCC has the power to regulate intrastate matters when Congress has unambiguously determined that federal law applies to those matters.

When Congress has enacted laws expressly governing intrastate matters, § 2(b) does not require Congress to use unusually clear and specific language to authorize the FCC to implement those laws. In other words, § 2(b) restricts the FCC's ancillary jurisdiction, not its ability to enforce substantive federal law. That § 2(b) was intended only as a limit on the FCC's exercise of ancillary jurisdiction is confirmed by the existence of § 201(b). Section 201(b) states, unambiguously and without limitation, "The Commission may prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this Act." Prior to passage of the 1996 Act, § 201(b) and § 2(b) were complementary and mutually reinforcing provisions. The plain text of § 201(b) gave the FCC authority to "prescribe rules and regulations" for all provisions of the Act, which then ap-

plied only to interstate matters, while at the same time the plain text of § 2(b) precluded the FCC from regulating purely intrastate matters (to which the Act did not then apply).

Following the passage of the 1996 Act, however, the Eighth Circuit treated these complementary provisions as conflicting. Under the Eighth Circuit's construction of § 2(b), § 2(b) deprived the FCC of authority to implement the provisions of the 1996 Act, while the plain text of § 201(b) gave the FCC that same authority. The Eighth Circuit resolved this tension by concluding that § 2(b)'s provision governed, in derogation of the unambiguous command of § 201(b). This resolution was accomplished by judicial fiat, without reference to the history of either § 201(b) or § 2(b).

This history makes clear that the tension between the plain meaning of § 201(b) and § 2(b) resulting from the Eighth Circuit's decision is the result not of poor congressional drafting, but of the Eighth Circuit's misreading of § 2(b). Section 2(b) was enacted to overrule *Houston E. and W. Texas Ry. Co. v. United States,* 234 U.S. 342 (1914) (*Shreveport*). The *Shreveport* decision upheld the ICC's preemption of intrastate state agency ratemaking, even though the Interstate Commerce Act (ICA) specified that its provisions "shall not apply to" intrastate matters. 234 U.S. at 356-57. The Court reasoned that the state agency had set an unnaturally low rate for intrastate traffic, which resulted in a form of discrimination against interstate traffic. This discriminatory effect on interstate commerce was held sufficient to give the ICC "jurisdiction" over the intrastate rate even though, by its terms, the ICA did not apply to intrastate services. *Id.* The *Shreveport* Court, in other words, permitted the ICC to exercise "ancillary" jurisdiction over intrastate matters even where the statute made clear that federal law did not "apply" to those matters.

The history of § 2(b) leaves no doubt that the 1934 Congress (which modeled the Communications Act on the

Interstate Commerce Act) adopted § 2(b)—and in particular § 2(b)'s limitation on the FCC's jurisdiction—to prevent application of *Shreveport*'s ancillary jurisdiction doctrine to the telecommunications field. *See generally A Legislative History of the Federal Communications Act of 1934* (Max D. Paglin ed. 1989) at 53-59.[28] *See also NARUC v. FCC*, 746 F.2d 1492, 1500 (D.C. Cir. 1984) (Bork, J.) ("Section 152(b) merely confirms that the States retain jurisdiction over purely intrastate calls notwithstanding the economic effect such State jurisdiction might have on the interstate market. Section 152(b) thus prevents the application of the so-called *Shreveport* rate decision . . . to the communications field.") (internal citation omitted).[29] Congress incorporated the ICA's prohibition that the Act not "apply" to intrastate matters, and then added a new prohibition to prevent the FCC from exercising jurisdiction over matters to which federal law did not otherwise apply. The latter provision thus prevented the FCC from using the *Shreveport* decision to circumvent Congress' decision as to the scope of federal law. Thus, § 2(b) makes clear that the FCC may *regulate* no further than Congress has chosen to *legislate*; it was at enactment, and remains, a bar only to the FCC's exercise of *ancillary* jurisdiction over intrastate services to which the Act does not otherwise apply.

If § 2(b) is read, as it was intended, to prevent only the FCC's exercise of ancillary jurisdiction, then § 201(b) and § 2(b) can each be given full effect. Section § 201(b) gives the FCC jurisdiction to regulate intrastate matters when Congress has unambiguously intended for federal law to apply to those matters, and § 2(b) bars the FCC

---

[28] *See* Senate Hearings on S. 2910 (March 14, 1934), at 179 (colloquy between Senators Dill and Long). *See also id.* at 154 (statement of K.R. Clardy); 78 Cong. Rec. 8823 (May 15, 1934) (statement of Chairman Dill).

[29] *See North Carolina Util. Comm'n v. FCC*, 552 F.2d 1036, 1047 (4th Cir. 1977) ("in enacting the Communications Act [of 1934], Congress sought to deny the FCC the kind of jurisdiction over local rates approved by the Shreveport Rate Case").

from exercising ancillary jurisdiction over intrastate matters when, as is the case with the establishment of consumer rates for intrastate services, federal law does not unambiguously apply. The sections thus remain, after the 1996 Act as they were before the 1996 Act, complementary.

In sum, the 1934 Act erected a presumptive partition between interstate matters—which were governed by federal law—and intrastate matters—which were governed by state law. Section 2(b) helped to maintain that partition by cabining the reach of federal law and of the FCC's corresponding jurisdiction. In the 1996 Act, Congress unambiguously made federal law applicable to intrastate matters that had previously been under the sole control of state commissions. Because Congress left no doubt that federal law applies to these intrastate matters, § 2(b) simply has no application to FCC rules implementing that federal law. The Eighth Circuit's failure to recognize § 2(b)'s inapplicability in such circumstances has resulted in an illogical and unprecedented regime that mocks the congressional intent to which it professes allegiance.

3. As if this were not enough—and it is—the FCC's implementation of the federal requirements of §§ 251 and 252 also falls squarely within § 2(b)'s "inseverability" exception. Under that exception, § 2(b) does not preclude FCC regulation of intrastate facilities when "it [is] not possible to separate the interstate and intrastate components of the asserted FCC regulation." *Louisiana*, 476 U.S. at 375 n.4. *See, e.g., California v. FCC*, 39 F.3d 919, 933 (9th Cir. 1994); *Public Utility Commission of Texas v. FCC*, 886 F.2d 1325, 1334 (D.C. Cir. 1989).

That exception—were it necessary—applies here. Because the new relationships mandated by § 251 will allow interstate uses of incumbents' facilities, *e.g.*, to originate and terminate interstate long distance calls, they have "interstate aspects" that are within the FCC's jurisdiction.[30]

---

[30] *See Local Competition Order* ¶¶ 87, 89, Pet. App. 192a-194a; Conf. Rep. at 123 (it is "the conferees' intent that the provisions

And, although the 1934 Act generally provided for separate spheres in which States regulate rates for intrastate services, while the FCC regulates rates for interstate services, the new regulatory paradigm envisioned by Congress and adopted in the 1996 Act, *see Local Competition Order* ¶¶ 83, 92, Pet. App. 190a-191a, 194a-195a; *see supra* pp. 4-8, eschews traditional jurisdictional boundaries and requires the States and the FCC to exercise parallel and complementary jurisdiction, with the FCC adopting regulations that affect both the interstate and intrastate aspects of interconnection, and with the States applying those regulations to local conditions to develop specific interconnection arrangements and prices. Because the Act's federal interconnection requirements contemplate carrier-to-carrier agreements that have *a single set of rates, terms, and conditions* and that apply without distinction to both interstate and intrastate uses of newly created local networks, the Act does not permit the new interconnection arrangements to be separated into "interstate aspects" and "intrastate aspects" that would be separately regulated. *See Local Competition Order* ¶ 92, Pet. App. 194a-195a. Thus, the Eighth Circuit's suggestion that a separations process could be used to allow the FCC to set rates for interstate uses of the local network, *see* Pet. App. 20a, therefore is flatly inconsistent with Congress' intent that a new regulatory paradigm—with a single rate—govern those agreements. Indeed, if Congress had intended for there to be different rates for the intrastate and interstate uses of the local network, it would no doubt have said so, and would have specified different procedures for establishing those different rates.[31]

---

of new section 251 are in addition to, and in no way limit or affect, the Commission's existing authority regarding interconnection").

[31] Indeed, no petitioner or other party to the FCC proceedings contended that the new duties of § 251 and § 252 could or should be divided between "interstate aspects" and "intrastate aspects" that the FCC and the States would separately regulate. *See Local Competition Order* ¶ 92, Pet. App. 194a-195a.

It is also no answer to assert, as the Eighth Circuit did, that the local competition provisions of the Act have only a "tangential impact" on interstate services. Pet. App. 22a-23a. Given that the incumbents receive over 20% of their revenues from *interstate* exchange access,[32] that suggestion is unsustainable. It is also beside the point. The FCC has undisputed authority to regulate interstate services, including the facilities and agreements relating to the provision of those services. Under the inseverability exception, if there is no basis for separating the interstate aspects of those facilities and agreements from the intrastate aspects, the FCC has jurisdiction regardless of the fraction of that service that is interstate.

Nor is it either accurate or relevant to state that the FCC "has no valid pricing authority over these areas of new localized competition." Pet. App. 21a. For the reasons stated above, *see* Parts II(A), (B), the Eighth Circuit's conclusion regarding the FCC's jurisdiction over intrastate matters is incorrect. In any event, the relevant point is that there is no indication that Congress intended to oust the FCC of its traditional jurisdiction over *interstate* matters (*see* n.30, *supra*), jurisdiction which is inextricably intertwined with the intrastate matters which the Eighth Circuit believed were not subject to the FCC's jurisdiction.

In sum, because it requires no "construction" to find an express grant of FCC jurisdiction over the substantive terms of the 1996 Act, § 2(b)'s rule of construction does not apply. And even if it did, application of § 2(b) would lead to the same result that obtains in its absence: the FCC properly exercised jurisdiction over the pricing requirements of the 1996 Act.

---

[32] *See* FCC, *Telecommunications Industry Revenue: TRS Fund Worksheet Data* (Nov. 1997) at Table 18B.

CONCLUSION

The Eighth Circuit's decisions invalidating § 51.315(b) of the FCC's rules, and stripping the FCC of plenary authority to implement the requirements of § 251 of the 1996 Act, should be reversed.

Respectfully submitted,

No. 96-3321

IOWA UTILITIES BOARD

v.

FCC

RELEVANT DOCKET ENTRIES

Date	PROCEEDINGS
9/6/96	PETITION for Review of an order of the FCC
9/13/96	Consolidation Order issued by Judicial Panel on Multidistrict Litigation: Eighth Circuit designated to hear petitions for review from District of Columbia, Second, Fifth, Sixth and Eighth Circuits.
10/3/96	ARGUED in Kansas City on Motion for Stay to Judges Pasco M. Bowman, Roger L. Wollman, David R. Hansen. William P. Barr for Petitioners, the Local Exchanges. Diane C. Munns for Petitioners, the State Utility Boards; Christoper J. Wright for Respondent, FCC & USA; David W. Carpenter for proposed Intervenors, the Telecommunications carriers. Rebuttal by Mr. Barr and Ms. Munns.
10/15/96	JUDGE ORDER: Having concluded that the petitioners satisfy the four requirements for granting a stay, we grant the petitioners' motion to stay the FCC's pricing rules and the "pick and choose" rule contained in its First Report and Order pending a final decision on the merits. Upon the filing of this order, the stay imposed by our order of September

Date	PROCEEDINGS
	27, 1996, is dissolved, and is replaced by the stay imposed by the terms of this order. (See order filed October 15, 1996).
11/1/96	JUDGE ORDER: The stay entered herein on October 15, 1996, is modified by lifting the stay only as to Sec. 51.701, Sec. 51.703, and Sec. 51.717, First Report and Order. To the extent requests were made in the filed resonses to lift the stay as to other of the final Rules, those requests were deemed to be motions seeking such relief and are denied.
1/17/97	ARGUED AND SUBMITTED IN ST. LOUIS TO JUDGES Pasco M. Bowman, Circuit Judge, Roger L. Wollman, Circuit Judge, David R. Hansen, Circuit Judge. William P. Barr for Large LECS (Bell Atlantic Corp., Bellsouth Corp., Pacific Telesis, SBC Communications, US West, GTE, Ameritech, NYNEX on Appeal in 96-3321+, Maureen E. 10/14/97	JUDGE ORDER: 1. The petitions for rehearing filed by AT & T, MCI, America's Carriers Telecommunications Assoc, Cable & Wireless WorldCom, Competitive Telecommunications Assoc, Sprint, Telecommunications Resellers Assoc, Fron-

Date	PROCEEDINGS
	tier, Competition Policy Institute, Assoc, for Local Telecommunication Services, Winstar Communications, Nextlink Communications, LLC, Time Warner, US One Communications, ICG Telecom Group, ACSI, and the Natl. Cable Television Assoc, are denied. The petitions for rehearing filed by GTE Entities, SBC Communications, Inc. BellSouth Corporation, US WEST, Bell Atlantic Corp, the Mid-Sized LEC's and Ameritech are granted. 2. Upon rehearing the Court' strikes Part II(G)(1)(f) of the opinion issued July 18, 1997, reported at 120 F.3d 753,813 (8th Cir. 1997), and substitutes the following (SEE ORDER FOR DETAILS) 3. Footnote 38 and 39 of the opinion filed July 18, 1997, are amended as follows: The citations to rule 51.315(c)-(f) are amended to read "51.315(b)-(f)."
1/15/98	ARGUED in ST. LOUIS on Petitioners' motion to enforce to Judges Pasco M. Bowman, Roger L. Wollman, David R. Hansen. Diane Carol Munns for Petitioner IUB in 96-3321, et al.; Mark Evans for Petitioners Bell South, et al. in 96-3321; M. Edward Whelan for Petitioners/Intervenors on Appeal GTE in 96-3321, et al.; Christopher J. Wright for Respondents FCC in 96-3321, et al., David W. Carpenter for Intervenors FCC in 96-3321, et al.; Rebuttal by Ms. Diane Munns and Mr. Mark Evans. RECORDED.
1/22/98	JUDGE ORDER: Writ of Mandamus. In accordance with the order of the United States Court of Appeals for the Eighth Circuit herein delivered, the FCC is hereby ordered to obey the Court's October 14, 1997, mandate in Appeal No. 96-3321, Iowa Utilities Board v. FCC. The FCC is ordered to apply section 252(d) of the Telecommunications Act of 1996 in the context of section 271 as the court's decision in Iowa Util. Bd. v. FCC, 120 F.3d

Date	PROCEEDINGS
	753 (8th Cir. 1997) requires. It is further ordered that the FCC cease and desist from attempting to give effect to its interpretation of the substantive requirements of section 252(d) of the Act. The FCC is ordered to confine its pricing role under section 271(d)(3)(A) to determining whether applicant BOCs have complied with the pricing methodology and rules adopted by the state commissions and in effect in the respective states in which such BOCs seek to provide in-region, inter-LATA services. It is so ordered.
1/22/98	THE COURT: Pasco M. Bowman, Roger L. Wollman, David R. Hansen. OPINION FILED by David R. Hansen PUBLISHED.

By the Commission:

* * * *

A. Background

4. In contrast to the 1996 Act, the common carrier provisions of the Communications Act of 1934 were grounded in the notion that interstate telecommunications services would be offered and regulated on a monopoly basis. For decades, state legislatures also followed this traditional approach in regulating LECs' intrastate services. Local and long distance telephone monopolies were created and maintained on the grounds that the provision of telecommunications services was a natural monopoly [8]

---

[8] A market is characterized as a natural monopoly if a single firm can serve the market at a lower cost than two or more firms. This

and, consequently, service could be provided at the lowest cost to the maximum number of consumers through a single regulated telecommunications network. The monopoly paradigm was thought to further goals of universal service, service quality, and reliability. The Modification of Final Judgment (MFJ) that required AT&T to divest the Bell Operating Companies (BOCs) in 1984 was not so much a repudiation as a reduction in the scope of this paradigm.[9] It reflected the judgment that the markets for interexchange services, telecommunications equipment, and information services could become competitive. At the same time, the local exchange continued to be treated as a natural monopoly that required rigorous regulatory oversight by state and federal authorities.

* * * *

6. We believe that, in enacting the 1996 Act, Congress recognized that although removing legal barriers to entry is necessary, it is still not sufficient to enable competition to replace monopoly in the local exchange. Congress acknowledged that incumbent LECs have constructed and put in place high quality, reliable, redundant local networks that can provide virtually ubiquitous service, and that they possess an approximate 99.7 percent share of the local market as measured by revenues.[13] Because of this

---

result is due to one provider being able to exploit economies of scale throughout the range of output likely to be demanded by the market. *See, e.g.*, Alfred Kahn *The Economics of Regulation* Vol. II 119 (1988); *see also* Daniel Spulber *Regulation and Markets* 3 (1989).

[9] *United States v. AT&T*, 552 F. Supp. 131 (D.D.C. 1982), *aff'd sub nom. Maryland v. United States*, 460 U.S. 1001 (1983), *vacated sub nom. United States v. Western Elect. Co.*, slip op. CA 82-0192 (D.D.C. Apr. 11, 1996).

[13] *Telecommunications Industry Revenue: TRS Fund Workshop Data*, FCC Industry Analysis Division, Feb. 1996, Tables 14 and 15 show that LEC revenues in 1994 were $98.4 billion, while total Competitive Access Provider revenue was $287 million. Even though competitive access provider (CAP) revenues have grown to approximately $1.15 billion in 1995, they still represent a *de minimis* por-

existing infrastructure, an incumbent LEC typically can serve a new customer at a much lower incremental cost than could a new entrant that is denied access to the incumbent LEC's facilities, and thereby is denied access to as many central office switches and as much trunking and subscriber loops as the incumbent LEC operates. Moreover, because virtually all existing customers subscribe to the incumbent LEC, a consumer of local switched service would not subscribe to a new entrant's network if the customer could not complete calls to the incumbent LEC's end users. As Congress appeared to recognize in enacting section 251, if the incumbent LEC has no obligation to interconnect and to arrange for mutual transport and termination of calls, it could effectively block or greatly retard entry into switched local service by using its economies of scale and network externalities as impediments to entry.

7. Congress expressly recognized that "it is unlikely that competitors will have a fully redundant network in place when they initially offer local service, because the investment necessary is so significant."[14] AT&T, for example, in filings before the Commission, has estimated that it would have to invest approximately $29 billion to construct new facilities in local markets in order to be able to provide full facilities to reach 20 percent of the 117 million access lines served by the BOCs.[15] Similarly,

tion of the market. *Local Telecommunications Competition Annual 1995-96*. Connecticut Research, Glastonbury, Conn. (1995) at i-5. Table 1.3.

[14] Joint Explanatory Statement at 148.

[15] AT&T submission, Mar. 18, 1996. By contrast, AT&T's capital construction cost for 1995 was $4.96 billion. *See* Merrill Lynch, *Telecom Services-Long Distance, Fourth Quarter Review: How Much Longer Can the Equilibrium Last? The Catalyst: The Telecommunications Act of 1996*, Feb. 15, 1996 at Table 6. Since January 1994, MCI Metro has spent $500 million to deploy a total of 2.338 route miles of fiber and 11 switches in 25 cities across the country.

cable [16] and wireless [17] systems will require substantial investment before either is capable of providing a widespread substitute for wireline telephony services.

* * * *

---

[16] Cable systems pass 96 percent of homes in the United States. *See Annual Assessment of the Status of Competition in the Market for the Delivery of Video Programming*, Second Annual Report. 11 FCC Rcd 2060 (1995) (based on a total of 91.6 million television households as of year-end 1994). The provision of telephony over cable systems, however, is largely in the experimental stages today. For example, Motorola recently announced that it will provide cable-telephony products to TCI Telephony Services, enabling TCI to begin cable-based telephony services in the Chicago area this year. Motorola Multimedia Announces Purchase Agreement with TCI. Press Release (September 21, 1995). As of October 1995, Time Warner was providing telephony to approximately 50 homes in the Rochester area. *The Big Boys Come Calling*, N.Y. Times, Oct. 19, 1995, at 1. Some other cable operators have announced plans to deploy cable-telephony systems by the end of 1996. *See* Paul Farhi, *Alexandria Cable Firm to Offer Phone Service: Company Would Compete With Bell*, Wash. Post, Feb. 17, 1996, at B1. Virtually all cable systems, however, will require significant network upgrades in order to provide telephony service, including additional deployment of fiber optic cable, additional electronics, and backup power systems.

[17] Although wireless technologies are continuing to develop, some wireless carriers, particularly in urban areas, currently face serious capacity constraints. These will be alleviated through the conversion from analog to digital service, further advances in compression technology, and the deployment of personal communications service (PCS). Huge investments to reduce cell size and increase frequency reuse may be required to give wireless systems a significant fraction of the traffic-carrying capacity of the incumbent LECs' networks. There is also currently a significant price difference between wireless and wireline service. A wireless call, for example, is typically priced at several times the price of a wireline call. Sprint Spectrum offers an introductory price for its wireless service of $15 per month, which includes access to the system, 15 minutes of air time, and $.31 per minute thereafter. *See A Beginner's Guide to the Cellular Maze*, Wash. Post. Dec. 4, 1995. In contrast, the average price paid by residential customers for local wireline service is about $.03 per minute. *See Trends in Telephone Service*, FCC Industry Analysis Division, Feb. 1995. Tabels 6 and 19.

(2) Access to Network Elements

86. Section 251(c)(3) requires incumbent LECs to provide "access" to network elements "on an unbundled basis."[115] We interpret these terms as requiring incumbent LECs for a fee to provide requesting carriers with the ability to obtain a particular element's functionality, such as a local loop's function of transmitting signals from a LEC central office to a customer premises, separate from that of other functionalities or network elements, such as the local switch. Further, the term "unbundled" suggests that there must be a separate charge for each purchased network element.[116] We seek comment on this and any alternative interpretations of section 251(c)(3).

* * * *

261 . We seek comment on whether the Commission can and should establish some standards that would assist the states in satisfying their obligations under this section. For example, should the Commission establish standards regarding what would constitute a "bona fide" request? We tentatively conclude that the states alone have authority to make determinations under section 271(f).

* * * *

265. Section 252(e)(5) directs the Commission to assume responsibility for any proceeding or matter in which the state commission "fails to act to carry out its responsibility" under that section.[374] We note that, unlike section 251(d)(1), there is no specified time within which the

---

115 1996 Act, sec. 101, § 251(c)(3).

116 "Access" is defined as the "ability or permission to approach, enter. . . . or use." *Random House College Dictionary* 9 (revised ed. 1980). "Unbundle" is defined as "to separate (the charges for related products and services usually offered in a single transaction at one all-inclusive price)." *Id.* at 1428.

374 1996 Act, sec. 101, § 252(e)(5). Before doing so, section 252(e)(5) requires the Commission to issue an order preempting the state's jurisdiction of that proceeding or matter.

Commission must establish regulations pursuant to section 252(e)(5). Thus, we seek comment on whether in this proceeding we should establish regulations necessary and appropriate to carry out our obligations under section 252(e)(5). We also seek comment on what constitutes notice of failure to act, and what procedures, if any, we should estabilsh for interested parties to notify the FCC that a state commission has failed to act.

By the Commission: Chairman Hundt and Commissioners Quello, Ness, and Chong issuing separate statements.

* * * *

14. We also note that many new entrants will not have fully constructed their local networks when they begin to offer service.[9] Although they may provide some of their own facilities, these new entrants will be unable to reach all of their customers without depending on the incumbent's facilities. Hence, in addition to an arrangement for terminating traffic on the incumbent LEC's network, entrants will likely need agreements that enable them to obtain wholesale prices for services they wish to sell at retail and to use at least some portions of the incumbents'

facilities, such as local loops and end office switching facilities.

* * * *

70. We further tentatively concluded in the NPRM that section 2(b) of the 1934 Act does not require a contrary conclusion.[88] Section 2(b) states that, except as provided in certain enumerated sections not including sections 251 and 252, "nothing in [the 1934] Act shall be construed to apply or to give to the Commission jurisdiction with respect to . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service by wire or radio of any carrier . . . ."[89] We noted in the NPRM that sections 251 and 252 do not alter the jurisdictional division of authority with respect to matters falling outside the scope of these provisions.[90] For example, rates charged to end users for local exchange service have traditionally been subject to state authority, and will continue to be.

* * * *

80. These parties also reject the claim that section 251 takes precedence over section 2(b).[124] They note that section 2(b) was not amended by the 1996 Act, although prior version of the bills would have done so.[125] Moreover, parties claim that, in other instances, Congress did specifically amend section 2(b) to give the Commission authority over intrastate aspects of specified matters.[126] Bell

---

[88] NPRM at para. 39.

[89] 47 U.S.C. § 152(b).

[90] NPRM at para. 40.

[124] *See, e.g.*, Bell Atlantic comments at 4; Connecticut Commission comments at 5; Oregon Commission comments at 12; Indiana Commission Staff comments at 4-5; Iowa Commission comments at 6.

[126] California Commission comments at 11; Connecticut Commission comments at 7 (*citing* the Omnibus Budget Reconciliation Act

Atlantic asserts that the failure to amend section 2(b) is "fatal to the notice's proposed federalization of intrastate interconnection and other intrastate matters."[127] The Ohio Commission expressly rejects the suggestion in the NPRM that there was no need to amend section 2(b) because sections 251 and 252 do not affect end user rates.[128]

* * * *

84. For the reasons set forth below, we hold that section 251 authorizes the FCC to establish regulations regarding both interstate and intrastate aspects of interconnection, services, and access to unbundled elements. We also hold that the regulations the Commission establishes pursuant to section 251 are binding upon states and carriers and section 2(b) does not limit the Commission's authority to establish regulations governing intrastate matters pursuant to section 251. Similarly, we find that the states' authority pursuant to section 252 also extends to both interstate and intrastate matters. Although we recognize that these sections do not contain an explicit grant of intrastate authority to the Commission or of interstate authority to the states, we nonetheless find that this interpretation is the only reasonable way to reconcile the various provisions of sections 251 and 252, and the statute as a whole. As we indicated in the NPRM, it would make little sense in terms of economics or technology to distinguish between interstate and intrastate components for purposes of sections 251 and 252.[139]

* * * *

of 1993 as an example of congressional intent to alter jurisdictional authority); Maryland Commission comments at 20; Ohio Commission comments at 14-15; BellSouth reply at 4.

127 Bell Atlantic comments at 7.

128 Ohio Commission comments at 15 (the 1993 amendments to sections 2(b) expressly reserved to states responsibility for wholesale rates in general).

139 We believe that this interpretation is the most reasonable one in light of our expectation that marketing and product offerings by

94. Some parties find significance in the fact that earlier drafts of the legislation would have amended section 2(b) to make an exception for Part II of Title II, including section 251, but the enacted version did not include that exception. These parties argue that this change in drafting demonstrates an intention by Congress that the limitations of section 2(b) remain fully in force with regard to sections 251 and 252. We find this argument unpersuasive.

95. Parties that attach significance to the omission of the proposed amendment of section 2(b) rely on a rule of statutory construction providing that, when a provision in a prior draft is altered in the final legislation, Congress intended a change from the prior version. This rule of statutory construction has been rejected, however, when changes from one draft to another are not explained.[155] In this instance, the only statement from Congress regarding the meaning of the omission of the section 2(b) amendment appears in the Joint Explanatory Statement of the Conference Report. According to the Joint Explanatory Statement, all differences between the Senate Bill, the House Amendment, and the substitute reached in conference are noted therein "except for clerical corrections, conforming changes made necessary by agreements reached by the conferees, and minor drafting and clerical changes."[156] Because the Joint Explanatory Statement did not address the removal of the section 2(b) amendment from the final bill, the logical inference is that Congress regarded the change as an inconsequential modification rather than a significant alteration. Moreover, it seems implausible that, by selecting the final version, Congress

---

telecommunications carriers will diminish or eliminate the significance of interstate-intrastate distinctions.

[155] *Mead Corp v. Tilley*, 490 U.S. 714, 723 (1989); *Rastelli v. Warden*, 782 F.2d 17, 23 (2d Cir. 1986); *Drummond Coal v. Watt*, 735 F.2d 469, 474 (11th Cir. 1984).

[156] Joint Explanatory Statement at 113.

intended a radical alteration of the Commission's authority under section 251, given the total lack of legislative history to that effect. We conclude that elimination of the proposed amendment of section 2(b) was a nonsubstantive change because, as AT&T contends, such amendment was unnecessary in light of the grants of authority under sections 251 and 252, and would have had no practical effect.[157]

* * * *

104. In the NPRM, we sought comment on our tentative conclusion that sections 251(c)(2), (c)(3), and (c)(6) establish the Commission's legal authority under section 251(d) to adopt pricing rules to ensure that the rates, terms, and conditions for interconnection, access to unbundled network elements, and collocation are just, reasonable, and nondiscriminatory.[175] We also sought comment on our tentative conclusion that sections 251 (b)(5) and 251(c)(4) establish our authority to define "wholesale rates" for purposes of resale, and "reciprocal compensation arrangements" for purposes of transport and termination of telecommunications services.[176] In addition, we asked parties to comment on our tentative conclusion that the Commission's statutory duty to implement the pricing requirements of section 251, as elaborated in section 252, requires that we establish pricing rules interpreting and further explaining the provisions of section 252(d). The states would then apply these rules in establishing rates pursuant to arbitrations and in reviewing BOC statements of generally available terms and conditions.[177]

105. We further sought comment on our tentative conclusion that national pricing rules would likely reduce or

---

[157] AT&T reply at 4 n.5.

[175] NPRM at para. 117.

[176] *Id.* at 118.

[177] *Id.* at para. 118.

eliminate inconsistent state regulatory requirements, increase the predictability of rates, and facilitate negotiation, arbitration, and review of agreements between incumbent LECs and competitive providers.[178] We also sought comment on the potential consequences of the Commission not establishing specific pricing rules.[179]

* * * *

126. We further conclude that section 252(e)(6) does not divest the Commission of jurisdiction, in whole or in part, over complaints that a common carrier violated section 251 or 252 of the Act. Section 601(c)(1) of the 1996 Act provides that the 1996 Act "shall not be construed to modify, impair or supersede" existing federal law —which includes the section 208 complaint process— "unless expressly so provided."[235] Sections 251 and 252 do not divest the Commission of its section 208 complaint authority.

127. An aggrieved party could file a section 208 complaint with the Commission, alleging that the incumbent LEC or requesting carrier has failed to comply with the requirements of sections 251 and 252, including Commission rules thereunder, even if the carrier is in compliance with an agreement approved by the state commission. Alternatively, a party could file a section 208 complaint alleging that a common carrier is violating the terms of a negotiated or arbitrated agreement. We plan to initiate a proceeding to adopt expedited procedures for resolving complaints filed pursuant to section 208.

128. We note that, in acting on a section 208 complaint, we would not be directly reviewing the state commission's decision, but rather, our review would be strictly limited to determining whether the common carrier's actions or omissions were in contravention of the Communi-

---

178 *Id.* at para. 119.

179 *Id.*

235 47 U.S.C. § 601(c)(1).

cations Act.[236] Thus, consistent with our past decisions in analogous contexts,[237] we conclude that a person aggrieved by a state determination under sections 251 and 252 of the Act may elect to either bring an action for federal district court review or a section 208 complaint to the Commission against a common carrier. Such a person could, as a further alternative, pursuant to section 207, file a complaint against a common carrier with the Commission or in federal district court for the recovery of damages.[238] We are unlikely, in adjudicating a complaint, to examine the consistency of a state decision with sections 251 and 252 if a judicial determination has already been made on the issues before us.[239]

* * * *

156. We also find that incumbent LECs may not require requesting carriers to satisfy a "bona fide request" process as part of their duty to negotiate in good faith. Some of the information that incumbent LECs propose to include in a bona fide request requirement may be legiti-

---

[236] While we would have authority to review such complaints, we note that we might decline, at least in some instances, to impose financial penalties upon a common carrier that is acting pursuant to state requirements or authorization, even if we sustain the allegations in the complaint.

[237] *See Number Portability Order, supra; Freemon v. AT&T*, 9 FCC Rcd 4032, 4033 (1994) (provision permitting persons aggrieved by violation of prohibition against unauthorized publication of certain communications to "bring a civil action in United States district court or any other court of competent jurisdiction" did not bar a complaint under section 208 of the Communications Act); *see also Policies Governing the Provision of Shared Telecommunications Service*, 3 FCC Rcd 6931 (1988) (the section 208 complaint process is available to resolve any specific problems that might arise regarding shared telecommunications service regulation by a state that impinges upon a federal interest).

[238] *See* 47 U.S.C. § 207.

[239] *Town of Deerfield v. FCC*, 992 F.2d 420, 428-430 (2d Cir. 1993).

mately demanded from the requesting carrier; some of the proposed requirements, on the other hand, exceed the scope of what is necessary for the parties to reach agreement, and imposing such requirements may discourage new entry. For example, parties advocate that a "bona fide request" requirement should require requesting carriers to commit to purchase services or facilities for a specified period of time. We believe that forcing carriers to make such a commitment before critical terms, such as price, have been resolved is likely to impede new entry. Moreover, we note that section 251(c) does not impose any bona fide request requirement. In contrast, section 251(f)(1) provides that a rural telephone company is exempt from the requirements of 251(c) until, among other things, it receives a "bona fide request" for interconnection, services, or network elements. This suggests that, if Congress had intended to impose a "bona fide request" requirement on requesting carriers as part of their duty to negotiate in good faith, Congress would have made that requirement explicit.

D. Applicability of Section 252 to Preexisting Agreements

1. Background

157. Section 252(a)(1) provides that, "[u]pon receiving a request for interconnection, services, or network elements pursuant to section 251, an incumbent local exchange carrier may negotiate and enter into a binding agreement with the requesting telecommunications carrier or carriers without regard to the standards set forth in subsections (b) and (c) of section 251 . . . . The agreement, including any interconnection agreement negotiated before the date of enactment of the Telecommunications Act of 1996, shall be submitted to the State commission under subsection (e) of this section." [295]

---

[295] 47 U.S.C. § 252(a)(1). Section 252(e) provides that "(a)ny interconnection agreement adopted by negotiation or arbitration

158. In the NPRM, we sought comment on whether sections 252(a)(1) and 252(e) require parties that have negotiated agreements for interconnection, services or network elements prior to the passage of the 1996 Act to submit such agreements to state commissions for approval. We also asked whether one party to such an existing agreement could compel renegotiation and arbitration in accordance with the procedures set forth in section 252.

2. Comments

159. In general, potential local competitors that addressed this issue argue that the plain language of section 251(a)(1) requires such agreements to be filed with the appropriate state commission for review under section 252(e).[296] In addition, these parties assert that, pursuant to section 252(i), the terms of such agreements must be made available to other carriers.[297] These parties claim that filing such agreements also should be required as a matter of public policy, because they provide evidence of existing interconnection terms that may provide the baseline for other negotiations,[298] and ensure that incumbents are not favoring some carriers over others.[299] Parties also

---

shall be submitted for approval to the State commission." 47 U.S.C. § 252(e).

[296] *See, e.g.*, ALTS comments at 14-16; CompTel comments at 104; GST comments at 7; Jones Intercable comments at 22-23; Ohio Consumers' Counsel comments at 6; Sprint comments at 12; TCC comments at 9-10; *see also* Louisiana Commission comments at 8 (carriers must submit preexisting agreements upon request by the state commission).

[297] Section 252(i) provides that a LEC "shall make available any interconnection, service, or network element provided under an agreement approved under this section to which it is a party to any other requesting telecommunications carrier upon the same terms and conditions as those provided in the agreement." 47 U.S.C. § 252(i).

[298] AT&T comments at 88-90; Jones Intercable comments at 22-23.

[299] ALTS comments at 14-16, reply at 39-41.

claim that preexisting agreements will provide useful information to the states,[300] and that states should have the ability to review preexisting agreements to ensure that they comply with the 1996 Act.[301]

160. Incumbent LECs allege that the statute does not require that preexisting agreements be filed with state commissions. They contend that Congress only intended parties to file agreements negotiated pursuant to section 251.[302] These parties point out that section 252(a) specifically refers to requests for interconnection, services, or network elements "pursuant to section 251," and contend that an agreement reached prior to the enactment of the 1996 Act, by definition, could not have been negotiated pursuant to section 251.[303] Several parties suggest that the 1996 Act only requires filing of preexisting agreements that have been amended subsequent to the enactment of the 1996 Act, or that have been incorporated by reference into agreements negotiated pursuant to section 251.[304] Some commenters also contend that, as a policy matter, there is no reason to require filing of preexisting agreements. The California Commission asserts that requiring filing and review of preexisting agreements would be burdensome for states, and is unnecessary, because many states already reviewed such agreements prior to the passage of the 1996 Act.[305]

[303] *See, e.g.*, Ameritech comments at 95-96; BellSouth comments at 10-11; NYNEX reply at 15-16 (section 251(i) also applies only to agreements approved under section 252).

[304] *See, e.g.*, Ameritech comments at 95-96; BellSouth comments at 10-11.

[305] California Commission comments at 33.

161. A related question is whether there should be a distinction between preexisting interconnection agreements between competitors within the same service area and agreements between non-competing or neighboring LECs. Several parties contend that the 1996 Act does not exempt such agreements from the filing requirement.[306] They also claim that it may be difficult to monitor whether parties are competing, and that, in light of the 1996 Act, parties that did not compete in the past may do so in the future.[307] ACTA asserts that such agreements will provide the best information available on technically, economically and operationally feasible interconnection arrangements, because these agreements were reached in a noncompetitive context, where the incumbent was not striving to protect its market from competition, and therefore, as a public policy matter, they should be publicly filed.[308] ALTS states that Wisconsin and other states have already addressed this issue and reached the same conclusion.[309]

162. Incumbent LECs argue that Congress did not contemplate that agreements between non-competing LECs would be used as models for agreements between competitors,[310] and that such agreements bear no relation to

---

[306] *See, e.g.*, Colorado Commission comments at 50; MFS comments at 66; Michigan Commission Staff comments at 20; Ohio Consumers' Counsel comments at 34; Oregon Commission comments at 33; ALTS reply at 35; Cox reply at 38-39; WinStar reply at 18-19.

Apr. 1, 1996).

[310] *See, e.g.*, NYNEX comments at 27 (*citing* Joint Explanatory Statement at 117, 120; Cong. Rec. S7893 (daily ed. June 7, 1995)

competitive interconnection agreements.[311] Some parties argue that requiring preexisting agreements between non-competing LECs would jeopardize universal service in many areas, especially where extended area service arrangements are in place.[312] NYNEX and the Rural Telephone Coalition contend that agreements between neighboring LECs fall within the provisions of section 259, which give rural LECs that lack economies of scope or scale the right to obtain or continue "infrastructure sharing" with neighboring larger LECs.[313]

163. Several parties recommend that agreements before enactment of the 1996 Act should be subject to a period of renegotiation.[314] For example, Sprint contends that the passage of the 1996 Act constitutes a "changed circumstance" that would justify renegotiation of preexisting agreements.[315] Sprint proposes that parties should be required to file preexisting agreements with the state commission, but that parties should be given a six-month period to renegotiate before the terms of such agreements

[315] Sprint comments at 12 (pre-Act agreements were entered into under a different regulatory scheme, and without contemplation by the parties that the local market might become competitive; in addition, such contracts might be inconsistent with section 251, and states should not expend resources reviewing them); *accord* Time Warner comments at 26 (the Commission should establish "fresh look" period as it has done in other cases involving changed circumstances).

are made available to others under section 252(i). Intermedia Communications advocates that parties that signed long-term contracts with incumbent LECs before additional rights and competitive alternatives were available under the 1996 Act should be permitted to terminate those agreements, with minimal liability, for a period of six months after such competitive alternatives become available.[316] GST advocates that only non-incumbent LECs that are parties to an agreement should have the right to renegotiate contracts.[317] The Texas Commission states that parties should be permitted to renegotiate in the event that the state determines that the preexisting agreement violates section 252.[318]

164. Some parties contend that there is no basis for renegotiating of preexisting contracts.[319] The Illinois Commission maintains that parties have a legal obligation to abide by the terms of their contracts, and the 1996 Act does not affect that obligation.[320] It claims that a unilateral right to abrogate existing contracts could undo progress that has already been made to foster local competition. The Illinois Commerce Commission notes that parties may mutually agree to amend existing contracts, and that a party that already has an agreement with an incumbent may request a new agreement under section 252(i) if the interconnection, services, or access to unbundled elements it seeks are different from those encompassed in the existing agreement. Pacific Telesis asserts that requiring renegotiation and arbitration of existing agreements would waste resources and interfere with parties' settled expectations.[321]

3. Discussion

165. We conclude that the 1996 Act requires all interconnection agreements, "including any interconnection agreement negotiated before the date of enactment of the Telecommunications Act of 1996," to be submitted to the state commission for approval pursuant to section 252(e).[322] The 1996 Act does not exempt certain categories of agreements from this requirement. When Congress sought to exclude preexisting contracts from provisions of the new law, it did so expressly. For example, section 276(b)(3) provides that "nothing in this section shall affect any existing contracts between location providers and payphone service providers or interLATA or intraLATA carriers that are in force and effect as of the date of enactment of the Telecommunications Act of 1996."[323] Nothing in the legislative history leads us to a contrary conclusion. Congress intended, in enacting sections 251 and 252, to create opportunities for local telephone competition. We believe that this pro-competitive goal is best effected by subjecting all agreements to state commission review.

166. The first sentence in section 252(a)(1) refers to requests for interconnection "pursuant to section 251."[324] The final sentence in section 252(a)(1) requires submission to the state commission of all negotiated agreements, including those negotiated *before* the enactment of the 1996 Act. Some parties have asserted that there is a tension between those two sentences. We conclude that the final sentence of section 252(a)(1), which requires that *any* interconnection agreement must be submitted to the state commission, can and should be read to be independ-

[323] 47 U.S.C. § 276(b)(3) (addressing nondiscrimination safeguards and regulations regarding payphone service).

[324] 47 U.S.C. § 252(a)(1).

ent of the prior sentences in section 252(a)(1). The interpretation suggested by some commenters that preexisting contracts need only be filed if they are amended subsequent to the 1996 Act, or incorporated by reference into agreements negotiated pursuant to the 1996 Act, would force us to impose conditions that were not intended by Congress.

167. As a matter of policy, moreover, we believe that requiring filing of all interconnection agreements best promotes Congress's stated goals of opening up local markets to competition, and permitting interconnection on just, reasonable, and nondiscriminatory terms. State commissions should have the opportunity to review *all* agreements, including those that were negotiated before the new law was enacted, to ensure that such agreements do not discriminate against third parties, and are not contrary to the public interest. In particular, preexisting agreements may include provisions that violate or are inconsistent with the pro-competitive goals of the 1996 Act, and states may elect to reject such agreements under section 252(e)(2)(A). Requiring all contracts to be filed also limits an incumbent LEC's ability to discriminate among carriers, for at least two reasons. First, requiring public filing of agreements enables carriers to have information about rates, terms, and conditions that an incumbent LEC makes available to others. Second, any interconnection, service or network element provided under an agreement approved by the state commission under section 252 must be made available to any other requesting telecommunications carrier upon the same terms and conditions, in accordance with section 252(i).[325] In addition, we believe that having the opportunity to review existing agreements may provide state commissions and potential competitors with a starting point for determining what is "technically feasible" for interconnection.[326]

---

[325] *See infra*, Section XV.B.

[326] *See, e.g.*, 47 U.S.C. §§ 251(c)(2)(B) and 251(c)(3).

168. Conversely, excluding certain agreements from public disclosure could have anticompetitive consequences. For example, such contracts could include agreements not to compete. In addition, if we exempt agreements between neighboring non-competing LECs, those parties might have a disincentive to compete with each other in the future, in order to preserve the terms of their preexisting agreements. Such a result runs counter to the goal of the 1996 Act to encourage local service competition. Moreover, preserving such "non-competing" agreements could effectively insulate those parties from competition by new entrants. For example, if a new entrant seeking to provide competitive local service in a rural community is unable to obtain from a neighboring BOC interconnection or transport and termination on terms that are as favorable as those the BOC offers to the incumbent LEC in the rural area, the new entrant cannot effectively compete.[327] This is because the new entrant will have to charge its subscribers higher rates than the incumbent LEC charges to place calls to subscribers of the neighboring BOC.

169. We find that section 259 does not compel us to reach a different conclusion regarding the application of section 252 to agreements between neighboring LECs.[328]

---

[327] This analysis does not address the separate question of whether an incumbent LEC in a rural area must offer interconnection, resale services, or unbundled network elements. As discussed *infra*, Section XII, Congress provided rural carriers with an exemption from section 251(c) requirements until the state commission removes such exemption. 47 U.S.C. § 251(f)(1).

[328] Section 259 requires the Commission to prescribe, within one year after the date of enactment of the 1996 Act, regulations that require incumbent LECs "to make available to any qualifying carrier such public switched network infrastructure, technology, information, and telecommunications facilities and functions as may be requested by such qualifying carrier to provide telecommunications services, or to provide access to information services . . ." 47 U.S.C. § 259(a). A "qualifying carrier" is a telecommunications carrier that "lacks economies of scale or scope," and that offers telephone exchange service, exchange access, and any other service included

Section 259 is limited to agreements for infrastructure sharing between incumbent LECs and telecommunications carriers that lack "economies of scale or scope," as determined in accordance with regulations prescribed by the Commission.[329] We conclude that the purpose and scope of section 259 differ significantly from the purpose and scope of section 251.[330] Section 259 is a limited and discrete provision designed to bring the benefits of advanced infrastructure to additional subscribers, in the context of the pro-competitive goals and provisions of the 1996 Act. Moreover, section 259(b)(7) requires LECs to file with the Commission or the state "any tariffs, contracts or other arrangements showing the rates, terms, and conditions under which such carrier is making available public switched network infrastructure and functions under this section."[331] We believe that this language further supports our conclusion that Congress intended agreements between neighboring LECs to be filed and available for public inspection. Commenters also have failed to persuade us that universal service is jeopardized by our finding that agreements between neighboring LECs are subject to section 252 filing and review provisions. Concerns regarding universal service should be addressed by the Federal-State Joint Board, empaneled pursuant to section 254 of the 1996 Act.[332] The Joint Board has initiated a comprehensive review of universal service issues and is considering, among other matters, access to telecommunications and information services in rural and high cost areas.[333] In addition, as discussed in Section XII, *infra*, the 1996 Act

[333] *See* 47 U.S.C. § 251(f).

provides for exemptions, suspension, or modification of some of the requirements in section 251 for rural or smaller carriers.

170. Some parties have suggested that we provide parties an opportunity to renegotiate preexisting contracts. Parties, of course, may mutually agree to renegotiate agreements, but we decline to mandate that parties renegotiate existing contracts. In addition, as discussed below, commercial mobile radio service (CMRS) providers that are party to preexisting agreements with incumbent LECs that provide for non-mutual compensation have the option of renegotiating such agreements with no termination liabilities or contract penalties.[334] We believe that generally requiring renegotiation of preexisting contracts is unnecessary, however, because state commissions will review preexisting agreements, and may reject any negotiated agreement that "discriminates against a telecommunications carrier not a party to the agreement," or that "is not consistent with the public interest, convenience, and necessity."[335] We recognize that preexisting agreements were negotiated under very different circumstances, and may not provide a reasonable basis for interconnection agreements under the 1996 Act. For example, non-competing neighboring LECs may have negotiated terms that simply are not viable in a competitive market. It would not foster efficient long-term competition to force parties to make available to all requesting carriers interconnection on terms not sustainable in a competitive environment. In such circumstances, a state commission would have authority to reject a preexisting agreement as inconsistent with the public interest. If a state commission approves a preexisting agreement, that agreement will be available to other parties in accordance with section 252(i). Contrary to NYNEX's assertion, once a state approves an agreement under section 252(e), that agreement is "approved under" section 252.

---

[334] *See infra*, Section XI.A.

[335] 47 U.S.C. § 252(e)(2)(A).

171. We decline to require immediate filing of pre-existing agreements. States should establish procedures and reasonable time frames for requiring filing of pre-existing agreements in a timely manner. We leave these procedures largely in the hands of the states in order to ensure that we do not impair some states' ability to carry out their other duties under the 1996 Act, especially if a large number of such agreements must be filed and approved by the state commission. We believe, nevertheless, that we should set an outer time period to file with the appropriate state commission agreements that Class A carriers have with other Class A carriers that pre-date the 1996 Act.[336] We conclude that setting such a time limit will ensure that third parties are not prevented indefinitely from reviewing and taking advantage of the terms of pre-existing agreements. We are concerned, however, about the burden that a national filing deadline might impose on small telephone companies that have preexisting agreements with Class A carriers or with other small carriers.[337] We therefore limit the filing deadline requirement to pre-existing agreements between Class A carriers. We encourage all carriers to file preexisting contracts with the appropriate state commission no later than June 30, 1997, but impose this as a *requirement* only with respect to agreements between Class A carriers. We find that requiring preexisting agreements between Class A carriers to be filed no later than June 30, 1997 is unlikely to burden state commissions unduly, and will give parties a reasonable opportunity to renegotiate agreements if they so choose, while at the same time, establishing this outer time limit ensures that third parties will have access to the terms of such agreements, under section 252(i), within a reasonable period. We expect to have completed proceedings on universal service and access charges by this filing

---

[336] Class A companies are defined as companies "having annual revenues from regulated telecommunications operations of $100,000,000 or more." 47 C.F.R. § 32.11(a)(1).

deadline. States may impose a shorter time period for filing preexisting agreements.

* * * *

B. National Interconnection Rules

1. Background

177. In the NPRM, we tentatively concluded that national interconnection rules would facilitate swift entry by competitors in multiple states by eliminating the need to comply with a multiplicity of state variations in technical and procedural requirements.[350] We sought comment on this tentative conclusion.

2. Comments

178. Parties raise many of the same arguments discussed above, in section II.A., regarding the advantages and disadvantages of explicit national rules for interconnection. IXCs, CAPs, cable operators, and others claim that national rules could prevent incumbent LECs from erecting artificial barriers to entry,[351] facilitate comprehensive business and network planning,[352] equalize bargaining power,[353] and expedite and simplify negotiations.[354] Other parties, including several BOCs and state commissions, argue that national rules should only be established for core requirements and should allow for state variations.[355]

[355] *See, e.g.*, Ameritech comments at 11; BellSouth comments at 13-14; Bell Atlantic reply at 6-7; GTE reply at 9; Lincoln Tel. com-

Some parties contend, for example, that the pace of technological change makes it impossible to create immutable and uniform interconnection rules.[356] SBC and PacTel claim that industry standards already exist for interconnection and that national standards would preclude the deployment of new technologies.[357] PacTel also claims that Commission rules requiring untested interconnection methodologies may slow competitive entry.[358]

3. Discussion

179. As discussed more fully above, we conclude that national rules regarding interconnection pursuant to section 251(c)(2) are necessary to further Congress's goal of creating conditions that will facilitate the development of competition in the telephone exchange market.[359] Uniform rules will permit all carriers, including small entities and small incumbent LECs, to plan regional or national networks using the same interconnection points in similar networks nationwide. Uniform rules will also guarantee consistent, minimum nondiscrimination safeguards and "equal in quality" standards in every state. Such rules will also avoid relitigating, in multiple states, the issue of whether interconnection at a particular point is technically feasible.

180. We believe, however, that inflexible or overly detailed national rules implementing section 251(c)(2) may inhibit the ability of the states or the parties to reach

[358] PacTel comments at 23-24.

[359] *See Supra*, Section II.A.

arrangements that reflect technological and market advances and regional differences. We also believe that, on several issues, the record is not adequate at this time to justify the establishment of national rules. Therefore, as required by section 251(d)(3) and as discussed in section II.C. above, our rules will permit states to go beyond the national rules discussed below, and impose additional pro-competitive interconnection requirements, as long as such requirements are otherwise consistent with the 1996 Act and the Commission's regulations. We believe that we can benefit from state experience in our ongoing review of these issues.

* * * *

3. Discussion

198. We conclude that the term "technically feasible" refers solely to technical or operational concerns, rather than economic, space, or site considerations. We further conclude that the obligations imposed by sections 251(c)(2) and 251(c)(3) include modifications to incumbent LEC facilities to the extent necessary to accommodate interconnection or access to network elements. Specific, significant, and demonstrable network reliability concerns associated with providing interconnection or access at a particular point, however, will be regarded as relevant evidence that interconnection or access at that point is technically infeasible. We also conclude that preexisting interconnection or access at a particular evidences the technical feasibility of interconnection or access at substantially similar points. Finally, we conclude that incumbent LECs must prove to the appropriate state commission that a particular interconnection or access point is not technically feasible.

* * * *

202. Several parties also attempt to draw a distinction between what is "feasible" under the terms of the statute, and what is "possible." The words "feasible" and "possible," however, are used synonymously. Feasible is defined

as "capable of being accomplished or brought about; possible."[435] The statute itself provides a more meaningful distinction. Unlike the "technically *feasible*" terminology included in sections 251(c)(2) and 251(c)(3), section 251(c)(6) uses the term "*practical* for technical reasons" in determining the scope of an incumbent LEC's obligation to provide for physical collocation.[436] "Practical" is defined as "manifested in practice or action . . . not theoretical or ideal"[437] or "adapted or designed for actual use; useful," and connotes similarity to ordinary usage.[438] Thus, it is reasonable to interpret Congress's use of the term "feasible" in sections 251(c)(2) and 251(c)(3) as encompassing more than what is merely "practical" or similar to what is ordinarily done. That is, use of the term "feasible" implies that interconnecting or providing access to a LEC network element may be feasible at a particular point even if such interconnection or access requires a novel use of, or some modification to, incumbent LEC equipment. This interpretation is consistent with the fact that incumbent LEC networks were not designed to accommodate third-party interconnection or use of network elements at all or even most points within the network. If incumbent LECs were not required, at least to some extent, to adapt their facilities to interconnection or use by other carriers, the purposes of section 251(c)(2) and 251(c)(3) would often be frustrated. For example, Congress intended to obligate the incumbent to accommodate the new entrant's network architecture by requiring the incumbent to provide interconnection "for the facilities and equipment" of the new entrant. Consistent with that intent, the incumbent must accept the novel use of, and

---

[435] The American Heritage College Dictionary 499 (1993). Webster's Ninth New Collegiate Dictionary 453 (1989). Both "feasible" and "possible" refer to that which is "capable of being realized" *Id.* at 918.

[436] 47 U.S.C. § 251(c)(6) (emphasis added).

[437] Webster's at 923.

[438] Random House College Dictionary 1040 (rev. ed. 1984).

modification to, its network facilities to accommodate the interconnector or to provide access to unbundled elements.

203. We also conclude, however, that legitimate threats to network reliability and security must be considered in evaluating the technical feasibility of interconnection or access to incumbent LEC networks. Negative network reliability effects are necessarily contrary to a finding of technical feasibility. Each carrier must be able to retain responsibility for the management, control, and performance of its own network. Thus, with regard to network reliability and security, to justify a refusal to provide interconnection or access at a point requested by another carrier, incumbent LECs must prove to the state commission, with clear and convincing evidence, that specific and significant adverse impacts would result from the requested interconnection or access. The reports of the Commission's Network Reliability Council discuss network reliability considerations, and establish templates that list activities that need to occur when service providers connect their networks pursuant to defined interconnection specifications or when they are attempting to define a new network interface specification.[439]

204. We further conclude that successful interconnection or access to an unbundled element at a particular point in a network, using particular facilities, is substantial evidence that interconnection or access is technically feasible at that point, or at substantially similar points in networks employing substantially similar facilities. In comparing networks for this purpose, the substantial similarity of network facilities may be evidenced, for example, by their adherence to the same interface or protocol standards. We also conclude that previous successful interconnection at a particular point in a network at a particular level of quality constitutes substantial evidence that inter-

---

[439] *Network Reliability: A Report to the Nation* (1993, National Engineering Consortium); *Network Reliability: The Path Forward* (1996, Internet: http://www.fcc.gov/oet/nrc).

connection is technically feasible at that point, or at substantially similar points, at that level of quality. Although most parties agree with this conclusion, some LECs contend that such comparisons are all but impossible because of alleged variability in network technologies, even where the ultimate services offered by separate networks are the same. We believe that, if the facilities are substantially similar, the LECs' contention is adequately addressed.

* * * *

251. We observed in the NPRM that the statutory definition of a "network element" draws a distinction between a "facility or equipment used in the provision of a telecommunications service," and the "service" itself.[533] We asked for comment on the meaning of this distinction in general, with respect to requirements for unbundling, and in connection with specific unbundled elements. We noted that the definition of a network element, *i.e.*, a facility, function, or capability, is not dependent on the particular types of services that are provided by means of the element (*e.g.*, interstate access, intrastate local exchange), and asked whether a carrier purchasing access to an element is obligated, pursuant to the definition, to provide all services typically carried or provided by that element.[534]

2. Comments

252. A number of parties, including potential local competitors and state commissions, support the adoption of a flexible method for identifying network elements. They argue that a flexible method is necessary to accomodate future changes in technology.[535] NYNEX, the Texas

---

[533] NPRM at para. 51, (*citing* 47 U.S.C. § 153(29)).

Public Utility Counsel, and GVNW contend that, to accommodate such changes, we should not define elements in rigid terms, or by specific technologies, but rather by general function.[536]

* * * *

3. Discussion

258. We adopt the concept of unbundled elements as physical facilities of the network, together with the features, functions, and capabilities associated with those facilities. Carriers requesting access to unbundled elements within the incumbent LEC's network seek in effect to purchase the right to obtain exclusive access to an entire element, or some feature, function or capability of that element. For some elements, especially the loop, the requesting carrier will purchase exclusive access to the element for a specific period, such as on a monthly basis. Carriers seeking other elements, especially shared facilities such as common transport, are essentially purchasing access to a functionality of the incumbent's facilities on a minute-by-minute basis. This concept of network elements, as discussed *infra* at section V.G., does not alter the incumbent LEC's physical control or ability or duty to repair and maintain network elements.

259. We conclude that we should identify a particular facility or capability for example, as a single network element, but allow ourselves and the states (where appropriate) the discretion to further identify, within that single facility or capability, additional required network

---

ments at 30; Ohio Commission comments at 33; Florida Commission comments at 18; Hyperion comments at 18; GST comments at 16; LDDS comments at 29; Ohio Consumers' Counsel comments at 18; Nextel comments at 8; Time Warner comments at 44-45 (the Commission should identify elements in a way that gives parties maximum flexibility); *but see* Ad Hoc Telecommunications Users Committee comments at 15-16 (define elements narrowly to give maximum flexibility to offer innovative services).

[536] NYNEX comments at 61-64; GVNW comments at 17-18; Texas Public Utility Counsel comments at 8-9.

elements. Thus, for example, in this proceeding, we identify the local loop as a single network element.[553] We also ask the states to evaluate, on a case-by-case basis, whether to require access to subloop elements, which can be facilities or capabilities within the local loop.[554] We agree with those commenters that argue that identifying a particular facility or capability as single network element, but allowing such elements to be further subdivided into additional elements, will allow our rules (as well as the states) to accommodate changes in technology, and thus better serve the interests of new entrants and incumbent LECs, and the procompetitive purposes of the 1996 Act.[555] We are not persuaded by PacTel's argument that it is unnecessary for our rules to permit the identification of additional elements, beyond those specifically referenced in parts of the 1996 Act, because our rules must conform to the definition of a network element, and they must accommodate changes in technology. Nor are we persuaded by BellSouth that identification of network elements should be left solely to the parties. We reject this approach for the same reasons that led us to adopt national unbundling requirements.[556] Finally, we agree with NYNEX and others that we should not identify elements in rigid terms, but rather by function.

260. We agree with MCI and MFS that the definition of the term network element includes physical facilities, such as a loop, switch, or other node, as well as logical features, functions, and capabilities that are provided by, for example, software located in a physical facility such as a switch.[557] We further agree with MCI that the em-

---

[553] *See infra*, Section V.J.

[554] *Id.*

[555] *See, e.g.*, District of Columbia Commission comments at 21-22; MFS comments at 36.

[556] *See supra*, Sections II.A, II.B, V.B.

[557] MCI comments at 27-28; MFS comments at 36-37.

bedded features and functions within a network element are part of the characteristics of that element and may not be removed from it. Accordingly, incumbent LECs must provide network elements along with all of their features and functions, so that new entrants may offer services that compete with those offered by incumbents as well as new services.

261. The only limitation that the statute imposes on the definition of a network element is that it must be "used in the provision of a telecommunications service." [558] Incumbent LECs provide telecommunications services not only through network facilities that serve as the basis for a particular service, or that accomplish physical delivery, but also through information (such as billing information) that enables incumbents to offer services on a commercial basis to consumers. Our interpretation of the term "provision" finds support in the definition of the term "network element." That definition provides that the type of information that may constitute a feature or function includes information "used in the transmission, routing or other provision of a telecommunications service." [559] Since "transmission" and "routing" refer to physical delivery, the phrase "or other provision of a telecommunications service" goes beyond mere physical delivery.

262. We conclude that the definition of the term "network element" broadly includes all "facilit[ies] or equipment used in the provision of a telecommunications service," and all "features, functions, and capabilities that are provided by means of such facility or equipment, including subscriber numbers, databases, signaling systems, and information sufficient for billing and collection or used in the transmission, routing, or other provision of a telecommunications service." [560] This definition thus includes, but is not limited to, transport trunks, call-related data-

---

[558] 47 U.S.C. § 153(29).

[559] *Id.*

[560] *Id.*

bases, software used in such databases, and all other unbundled elements that we identify in this proceeding.[561] The definition also includes information that incumbent LECs use to provide telecommunications services commercially, such as information required for pre-ordering,[562] ordering, provisioning,[563] billing, and maintenance and repair services. This interpretation of the definition of the term "network element" will serve to guide both the Commission and the states in evaluating further unbundling requirements beyond those we identify in this proceeding.

263. We disagree with those incumbent LECs which argue that features that are sold directly to end users as retail services, such as vertical features, cannot be considered elements within incumbent LEC networks.[564] If we were to conclude that any functionality sold directly to end users as a service, such as call forwarding or caller ID, cannot be defined as a network element, then incumbent LECs could provide local service to end users by selling them unbundled loops and switch elements, and thereby entirely evade the unbundling requirement in section 251(c)(3).[565] We are confident that Congress did not intend such a result. We further reject Ameritech's argument that we should not permit carriers to use unbundled elements to provide services that are priced above cost at retail. We agree with those parties that argue that competition will not develop if we find that supracompetitive pricing is protected by the 1996 Act.[566]

---

[566] *See, e.g.*, DoJ reply at 23-31; CompTel reply at 13-22. For a discussion of the argument that allowing new entrants to purchase

264. Moreover, we agree with those commenters that argue that network elements are defined by facilities or their functionalities or capabilities, and thus, cannot be defined as specific services. A single network element could be used to provide many different services. For example, a local loop can be used to provision inter- and intrastate exchange access services, as well as local exchange services. We conclude, consistent with the findings of the Ohio and Oregon Commissions, that the plain language of section 251(c)(3) does not obligate carriers purchasing access to network elements to provide all services that an unbundled element is capable of providing or that are typically offered over that element.[567] Section 251(c)(3) does not impose any service-related restrictions or requirements on requesting carriers in connection with the use of unbundled elements.

D. Access to Network Elements

1. Background

265. In the NPRM, we observed that section 251(c)(3) requires incumbent LECs to provide "access" to network elements "on an unbundled basis."[568] We interpreted these terms to mean that incumbent LECs must provide carriers with the functionality of a particular element, separate from the functionality of other elements, and must charge a separate fee for each element. We sought comment on this interpretation and any alternative interpretations.[569]

* * * *

---

vertical features as unbundled elements would nullify section 251(c)(4), *see infra*, Section V.H.

[567] Ohio Commission comments at 33; Oregon Commission comments at 27.

[568] 47 U.S.C. § 251(c)(3).

[569] NPRM at para. 86.

3. Discussion

268. We conclude that we should adopt our proposed interpretation that the terms "access" to network elements "on an unbundled basis" mean that incumbent LECs must provide the facility or functionality of a particular element to requesting carriers, separate from the facility or functionality of other elements, for a separate fee. We further conclude that a telecommunications carrier purchasing access to an unbundled network facility is entitled to exclusive use of that facility for a period of time, or when purchasing access to a feature, function, or capability of a facility, a telecommunications carrier is entitled to use of that feature, function, or capability for a period of time. The specified period may vary depending on the terms of the agreement between the incumbent LEC and the requesting carrier. The ability of other carriers to obtain access to a network element for some period of time does not relieve the incumbent LEC of the duty to maintain, repair, or replace the unbundled network element.[573] We reject PacTel's interpretation of the terms quoted above because it is inconsistent with our definition of the term network element (*i.e.*, an element includes all features and functions embedded in it). Moreover, to the extent that PacTel's argument suggests that the 1996 Act does not require unbundled elements to be provisioned in a way that would make them useful, we find that its statutory interpretation is inconsistent with the statute's goal of providing new entrants with realistic means of competing against incumbents.

* * * *

---

573 We clarify that title to unbundled network elements will not shift to requesting carriers.

E. Standards Necessary to Identify Unbundled Network Elements

1. Background

271. In the NPRM, we raised a number of issues concerning the meaning of technical feasibility in connection with unbundled elements.[680] We also sought comment on the extent to which the Commission should consider the standards set forth in section 251(d)(2) in identifying required unbundled elements, and on how we ought to interpret these standards.[681] Subsection (d)(2) provides that "(i)n determining what network elements should be made available for purposes of subsection (c)(3), the Commission shall consider, at a minimum" the following two standards, "whether (A) access to such network elements as are proprietary in nature is necessary; and (B) the failure to provide access to such network elements would impair the ability of the telecommunications carrier seeking access to provide the services that it seeks to offer."[682] We further asked about the relationship between the latter standard and the requirement in section 251(c)(3) that carries be able to use unbundled elements to provide a telecommunications service.[683]

2. Comments

272. Commenters raised two issues in interpreting the standard relating to whether access to proprietary elements is necessary. The first issue relates to whether incumbent LECs are required to provide proprietary information contained in network elements (*e.g.*, Customer Premises Network Information contained in databases);

---

[680] NPRM at paras. 87-88. *See supra*, Section IV.D, for a discussion of these issues.

[681] NPRM at para. 88.

[682] 47 U.S.C. § 251(d)(2).

[683] NPRM at para. 90.

and the second to whether incumbent LECs are required to provide network elements which are proprietary (*e.g.*, elements with proprietary protocols.) As to the first issue, Ameritech, SBC, BellSouth, PacTel, Texas Statewide Telephone Cooperative, Inc. and the Wyoming Commission argue that the Commission should protect proprietary information contained in incumbent LECs' networks.[584] BellSouth and PacTel further argue that we should prohibit access to elements containing proprietary information unless new entrants meet a heavy burden demonstrating need.[585]

273. As to the second issue, a few incumbent LECs argue generally that the Commission should require unbundling of proprietary network elements only under certain limited circumstances.[586] USTA argues that, if we do not grant incumbent LECs the ability to deny their competitors access to proprietary elements, we will stifle the incumbents' incentives to provide innovative services and thereby inhibit competition.[587] PacTel contends that we should not require unbundling of elements with proprietary protocols unless a new entrant demonstrates a heavy burden of need.[588] Ameritech and GTE assert that we should require unbundling of proprietary elements only when the failure to do so would prevent a carrier from offering a service.[589] GTE adds that, if an element is

available from other sources, unbundling should not be mandated. Moreover, according to GTE, if incumbent LECs do make proprietary elements available, they should be compensated for the use of their intellectual property.[890] In contrast, the Consumer Federation of America asserts that, if we define proprietary elements broadly and require new entrants to demonstrate need before they may obtain them, we would significantly inhibit new entry.[891]

274. Most BOCs and GTE contend that the general obligation imposed by section 251(c)(3) is limited by section 251(d)(2)'s standard of whether the failure to provide access to network elements would impair the ability of carriers to offer a service. They argue that this standard requires incumbent LECs to provide unbundled elements only where the failure to do so would prohibit a carrier from providing a service.[892] Commenters offer two different standards by which we may determine whether a carrier may require an incumbent LEC to provide an unbundled element in order for the carrier to offer a service. First, GTE, PacTel and BellSouth argue that unbundling is not required if a carrier can obtain, or provide itself, the requested element on reasonable terms and conditions.[893] The burden of meeting this standard, according to GTE, falls on the requesting carrier.[894] If a carrier fails to meet this standard, but continues to request an element, BellSouth claims, that carrier must meet a

[894] GTE reply at 17.

heavier burden.[595] Second, PacTel and Ameritech argue that, if a carrier can offer a service by purchasing the underlying service from the incumbent LEC and reselling it, pursuant to section 251(c)(4), the carrier is not impaired in its ability to offer the service. Thus, they argue, new entrants cannot use unbundled elements exclusively to offer the same services that new entrants can obtain from an incumbent LEC under the resale provision.[596]

275. The Department of Justice and Comptel reject the BOCs' argument that the general obligation imposed by section 251(c)(3) is limited by consideration of whether the failure to provide access to an element would impair a carrier's ability to offer a service. They argue that the term "impair" does not mean "prevent," and that we should interpret this standard to mean that a carrier's ability to provide a service is impaired if obtaining an element from a third party is more costly than obtaining that same element from the incumbent. They also dispute the incumbent LECs' argument that the "impair" language in this standard means that new entrants cannot exclusively use unbundled elements to provide the same or similar retail services that an incumbent offers. They argue that, if similarity is enough to prevent the use of unbundled elements, then section 251(c)(3) would be nullified. They further contend that, under the BOCs' theory, incumbents could prevent new entry through the use of unbundled elements by offering unbundled loops, switching, and other elements as retail services.[597] CompTel also argues that this standard refers back to the first standard in section 251(d)(2) and means that incumbents must provide proprietary elements only if the failure

---

[596] BellSouth comments at 31-33; Ameritech comments at 25-31; *see infra*, Section V.H, for a further discussion of the relationship between sections 251(c)(3) and 251(c)(4).

[597] *See, e.g.*, DoJ comments at 48-51, reply at 23-31; CompTel reply at 13-22; *see also*, AT&T reply at 13-20.

to do so would prevent a requesting carrier from offering a telecommunications service.[598]

276. AT&T argues that the plain language of section 251(c)(3) means that incumbent LECs must provide unbundled elements that new entrants request, and that the factors in section 251(d)(2) are minimum considerations and not threshold requirements.[599] BellSouth and SBC agree that the "at minimum" language in section 251(d)(2) means the Commission can consider other factors not enumerated in the statute in determining what elements incumbent LECs must offer to requesting carriers.[600] Similarly, several commenters suggest that, in determining which elements must be offered, we should consider a number of additional factors, including, for example, whether there is a demonstrable market demand for a particular element.[601]

3. Discussion

277. Section 251(c)(3) and 251(d)(2) set forth standards the Commission must consider in identifying make available in connection with arbitrations before state unbundled network elements that incumbent LECs must commissions and BOC statements of generally available terms and conditions. These standards guide the unbundling requirements we issue today as well as any different or additional unbundling requirements we may issue in the future. Similarly, the states must follow our interpretation of these standards to the extent they impose additional

unbundling requirements during arbitrations or subsequent rulemaking proceedings.

278. Section 251(c)(3) requires incumbent LECs to provide requesting carriers with "nondiscriminatory access to network elements on an unbundled basis at any technically feasible point."[602] We find that this clause imposes on an incumbent LEC the duty to provide all network elements for which it is technically feasible to provide access on an unbundled basis. Because section 251(d)(1) requires us to "establish regulations to implement the requirements of" section 251(c)(3), we conclude that we have authority to establish regulations that are coextensive with the duty section 251(c)(3) imposes on incumbent LECs.

279. Section 251(d)(2), however, sets forth standards that do not depend on technical feasibility. More specifically, section 251(d)(2) provides that, in identifying unbundled elements, the Commission shall "consider, at a minimum," whether access to proprietary elements is necessary (the "proprietary standard"), and whether requesting carriers' ability to provide services would be impaired if the desired elements were not provided by an incumbent LEC (the "impairment standard.") Thus, section 251(d)(2) gives us the authority to decline to require incumbent LECs to provide access to unbundled network elements at technically feasible points if, for example, we were to conclude that access to a particular proprietary element is not necessary. To give effect to both sections 251(c)(3) and 251(d)(2), we conclude that the proprietary and impairment standards in section 251(d)(2) grant us the authority to refrain from requiring incumbent LECs to provide all network elements for which it is technically feasible to provide access on an unbundled basis. The authority we derive from section 251(d)(2) is limited, however, by our interpretation of these standards, and this section, as set forth below.

---

[602] 47 U.S.C. § 251(c)(3).

280. We agree with BellSouth, SBC, and others that the plain import of the "at minimum" language in section 251(d)(2) requires us, in identifying unbundled network elements, to "consider" the standards enumerated there, as well as other standards we believe are consistent with the objectives of the 1996 Act. We conclude that the word "consider" means we must weigh the standards enumerated in section 251(d)(2) in evaluating whether to require the unbundling of a particular element.

281. We further conclude that, in evaluating whether to impose additional unbundling requirements during the arbitration process, states must apply our definition of technical feasibility, discussed above in section IV.D. A determination of technical feasibility would then create a presumption in favor of requiring an incumbent LEC to provide the element. If providing access to an unbundled element is technically feasible, a state must then consider the standards set forth in section 251(d)(2), as we interpret them below. Similarly, the Commission will apply this analysis where we must arbitrate specific unbundling issues, under section 252(e)(5), and in future rulemaking proceedings that may consider additional or possibly different unbundling requirements.

282. Section 251(d)(2)(A) requires the Commission and the states to consider whether access to proprietary elements is "necessary." "Necessary" means, in this context, that an element is a prerequisite for competition. We believe that, in some instances, it will be "necessary" for new entrants to obtain access to proprietary elements (*e.g.*, elements with proprietary protocols or elements containing proprietary information), because without such elements, their ability to compete would be significantly impaired or thwarted.[603] Thus, as an initial matter, we

---

[603] As noted *supra*, Section V.E.2, a number of commenters argue that section 251(d)(2)(A) requires us to protect proprietary information, such as CPNI information, contained in network ele-

decline to adopt a general rule, as suggested by some incumbents, that would prohibit access to such elements, or make access available only upon a carrier demonstrating a heavy burden of need. We acknowledge that prohibiting incumbents from refusing access to proprietary elements could reduce their incentives to offer innovative services. We are not persuaded, however, that this is a sufficient reason to prohibit generally the unbundling of proprietary elements, because the threat to competition from any such prohibition would far exceed any costs to consumers resulting from reduced innovation by the incumbent LEC.[604] Moreover, the procompetitive effects of our conclusion generally will stimulate innovation in the market, offsetting any hypothetical reduction in innovation by the incumbent LECs.

283. We further conclude that, to the extent new entrants seek additional elements beyond those we identify herein, section 251(d)(2)(A) allows the Commission and the states to require the unbundling of such elements unless the incumbent can prove to a state commission that: (1) the element is proprietary, or contains proprietary information that will be revealed if the element is provided on an unbundled basis; and (2) a new entrant could offer the same proposed telecommunications service through the use of other, nonproprietary unbundled elements within the incumbent's network. We believe this interpretation of section 251(d)(2)(A) will best advance the procompetitive purposes of the 1996 Act. It allows

---

ments. We intend to treat issues regarding CPNI in our rulemaking proceeding on CPNI information. *Telecommunications Carriers' Use of Customer Proprietary Network Information and Other Customer Information*, CC Docket No. 96-115, Notice of Proposed Rulemaking, FCC 96-221 (rel. May 17, 1996).

[604] In this proceeding, for example, we are requiring incumbent LECs to provide the local switching element which includes vertical features that some carriers contend are proprietary. *See infra*, Section V.J.

new entrants to obtain proprietary elements from incumbent LECs where they are necessary to offer a telecommunications service, and, at the same time, it gives incumbents the opportunity to argue, before the states or the Commission, against unbundling proprietary elements where a new entrant could offer the same service using other unbundled elements in the incumbent's network. We decline to adopt the interpretation of section 251 (d)(2)(A) advanced by some incumbents that incumbent LECs need not provide proprietary elements if requesting carriers can obtain the requested proprietary element from a source other than the incumbent. Requiring new entrants to duplicate unnecessarily even a part of the incumbent's network could generate delay and higher costs for new entrants, and thereby impede entry by competing local providers and delay competition, contrary to the goals of the 1996 Act.

284. We further conclude that, to the extent new entrants do not need access to all the proprietary information contained within an element in order to provide a telecommunications service, the Commission and the states may take action to protect the proprietary information. For example, to provide a telecommunications service, a new entrant might need access to information about a particular customer that is in an incumbent LEC database. The database to which the new entrant requires access, however, may contain proprietary information about all of the incumbent LECs' customers. In this circumstance, the new entrant should not have access to proprietary information about the incumbent LEC's other customers where it is not necessary to provide service to the new entrant's particular customer. Accordingly, we believe the Commission and the states have the authority to protect the confidentiality of proprietary information in an unbundled network element, such as a database, where that information is not necessary to enable a new entrant to

offer a telecommunications service to its particular customer.

285. Section 251(d)(2)(B) requires us to consider whether the failure to provide access to an element would "impair" the ability of a new entrant to provide a service it seeks to offer. The term "impair" means "to make or cause to become worse; diminish in value." [605] We believe, generally, that an entrant's ability to offer a telecommunications service is "diminished in value" if the quality of the service the entrant can offer, absent access to the requested element, declines and/or the cost of providing the service rises. We believe we must consider this standard by evaluating whether a carrier could offer a service using other unbundled elements within an incumbent LEC's network. Accordingly, we interpret the "impairment" standard as requiring the Commission and the states, when evaluating unbundling requirements beyond those identified in our minimum list, to consider whether the failure of an incumbent to provide access to a network element would decrease the quality, or increase the financial or administrative cost of the service a requesting carrier seeks to offer, compared with providing that service over other unbundled elements in the incumbent LEC's network.

286. We decline to adopt the interpretation of the "impairment" standard advanced by most BOCs and GTE. Under their interpretation, incumbent LECs must provide unbundled elements only when the failure to do so would prevent a carrier from offering a service. We also reject the related interpretations that carriers are not impaired in their ability to provide a service if they can obtain elements from another source, or if they can provide the proposed service by purchasing the service at wholesale rates from a LEC. In general, and as discussed above, section 251(c)(3) imposes on incumbent LECs

---

[605] *See* Random House College Dictionary 665 (rev. ed. 1984).

the obligation to offer on an unbundled basis all network elements for which it is technically feasible to provide access. We believe the plain language of section 251 (d)(2), and the standards articulated there, give us the discretion to limit the general obligation imposed by subsection 251(c)(3), but they do not require us to do so. The standards set forth in section 251(d)(2) are minimum considerations that the Commission shall take into account in evaluating unbundling requirements. Accordingly, we conclude that the statute does not require us to interpret the "impairment" standard in a way that would significantly diminish the obligation imposed by section 251(c)(3).

287. The interpretation advanced by most of the BOCs and GTE, described above, means that, if a requesting carrier could obtain an element from a source other than the incumbent, then the incumbent need not provide the element. We agree with the reasoning advanced by some of the commenters that this interpretation would nullify section 251(c)(3) because, in theory, any new entrant could provide all of the elements in the incumbents' networks. Congress made it possible for competitors to enter local markets through the purchase of unbundled elements because it recognized that duplication of an incumbent's network could delay entry, and could be inefficient and unnecessary.[606] The interpretation proffered by the BOCs and GTE would inhibit new entry and thus restrict the potential for meaningful competition, which would undermine the procompetitive goals of the 1996 Act. As a practical matter, if it is more efficient and less costly for new entrants to obtain network elements from a source other than an incumbent LEC, new entrants will likely pursue the more efficient and less costly approach. Additionally, as discussed above at section IV.C, we believe that allowing incumbent LECs to deny access to

---

[606] *See* LDDS comments at 37, reply at 14-15.

unbundled elements on the grounds that an element is equivalent to a service available at resale would lead to impractical results, because incumbents could completely avoid section 251(c)(3)'s unbundling obligations by offering unbundled elements to end users as retail services.[607]

288. Finally, we decline at this time to adopt any of the additional criteria proposed by commenters. We conclude that none of the additional factors suggested by commenters enhances our ability to identify unbundled network elements consistent with the procompetitive goals of the 1996 Act.[608] These additional considerations would limit unbundling requirements or make it administratively more difficult for new entrants to obtain additional unbundled elements beyond those identified in our minimum list of required elements. For example, we believe that the proposal that new entrants must provide detailed estimates regarding projected market demand is not necessary for incumbent LECs to efficiently plan for network growth.

* * * *

307. We agree with those commenters, including the Florida, Illinois and Washington Commissions, that to achieve the procompetitive goals of the 1996 Act, it is necessary to establish rules that define the obligations of incumbent LECs to provide nondiscriminatory access to unbundled network elements, and to provide such elements on terms and conditions that are just, reasonable and nondiscriminatory.[671] As discussed above at sections II.A,

---

[607] *See infra*, Section V.H, for a further discussion on the relationship between sections 251(c)(3) and 251(c)(4).

[608] *See, e.g.*, Texas Public Utility Counsel comments at 9-11; Cincinnati Bell comments at 15; Nortel comments at 6 (the diversion of research and development efforts to facilities that new entrants do not really want will stifle innovation); SBC comments at 25-37, 84-99.

[671] *See infra*, Section VII, for a discussion of just, reasonable and nondiscriminatory rates for unbundled network elements.

II.B. and V.B., we believe that incumbent LECs have little incentive to facilitate the ability of new entrants, including small entities, to compete against them and, thus, have little incentive to provision unbundled elements in a manner that would provide efficient competitors with a meaningful opportunity to compete. We are also cognizant of the fact that incumbent LECs have the incentive and the ability to engage in many kinds of discrimination. For example, incumbent LECs could potentially delay providing access to unbundled network elements, or they could provide them to new entrants at a degraded level of quality.

308. Consistent with arguments advanced by the Florida and Washington Commissions, incumbent LECs, and potential competitors, and as more fully discussed in the specific sections below, we adopt general, national rules defining "nondiscriminatory access" to unbundled network elements, and "just, reasonable, and nondiscriminatory" terms and conditions for the provision of such elements. We have chosen this approach, rather than allowing states exclusively to consider these issues, because we believe that some national rules regarding nondiscriminatory access will reduce the costs of entry and speed the development of competition.[672]

* * * *

a. Nondiscriminatory Access to Unbundled Network Elements

312. We conclude that the obligation to provide "nondiscriminatory access to network elements on an unbundled basis"[674] refers to both the physical or logical connection to the element and the element itself. In considering how to implement this obligation in a manner that would achieve the 1996 Act's goal of promoting

---

[672] *See supra*, Section V.B.

[674] 47 U.S.C. § 251(c)(3).

local exchange competition, we recognize that new entrants, including small entities, would be denied a meaningful opportunity to compete if the quality of the access to unbundled elements provided by incumbent LECs, as well as the quality of the elements themselves, were lower than what the incumbent LECs provide to themselves. Thus, we conclude it would be insufficient to define the obligation of incumbent LECs to provide "nondiscriminatory access" to mean that the quality of the access and unbundled elements incumbent LECs provide to all requesting carriers is the same. As discussed above with respect to interconnection,[675] an incumbent LEC could potentially act in a nondiscriminatory manner in providing access or elements to all requesting carriers, while providing preferential access or elements to itself. Accordingly, we conclude that the phrase "nondiscriminatory access" in section 251(c)(3) means at least two things: first, the quality of an unbundled network element that an incumbent LEC provides, as well as the access provided to that element, must be equal between all carriers requesting access to that element; second, where technically feasible, the access and unbundled network element provided by an incumbent LEC must be at least equal-in-quality to that which the incumbent LEC provides to itself.[676]

* * * *

3. Discussion

328. The language of section 251(c)(3) is cast exclusively in terms of obligations imposed on incumbent LECs, and it does not discuss, reference, or suggest a limitation or requirement in connection with the right of new en-

---

675 *See supra*, Sections IV.G, IV.H.

676 We note that providing access or elements of lesser quality than that enjoyed by the incumbent LEC would also constitute an "unjust" or "unreasonable" term or condition.

trants to obtain access to unbundled elements. We conclude, therefore, that Congress did not intend section 251(c)(3) to be read to contain any requirement that carriers must own or control some of their own local exchange facilities before they can purchase and use unbundled elements to provide a telecommunications service. We note that the Illinois Commission has reached the same conclusion.[707]

329. We reject the arguments advanced by Bell Atlantic and NYNEX that the language of section 251(c)(3) requires carriers seeking access to unbundled elements to own some local exchange facilities, and that this serves to distinguish section 251(c)(3) from section 251(c)(4). The "at any technically feasible point" language in section 251(c)(3) refers to points in an incumbent LEC's network where new entrants may obtain access to elements. It does not, however, require that new entrants interconnect local exchange facilities which they own or control at that technically feasible access point. If we were to conclude otherwise, then new entrants would be prohibited from requesting two network elements that are connected to each other because the new entrant would be required to connect a single network element to a facility of its own. The 1996 Act, however, does not impose any limitations on carriers' ability to obtain access to unbundled network elements. Moreover, we conclude that Congress did not intend to limit access to unbundled elements in this manner because such a limit would seriously inhibit the ability of potential competitors to enter local markets through the use of unbundled elements, and thus would retard the development of local exchange competition. We also reject NYNEX's argument that the phrase "such telecommunications service" excludes services provided by the incumbent. This interpretation is inconsistent with the

---

[707] AT&T Communications of Illinois, Inc. *et al.*, Petition for a Total Local Exchange Wholesale Service Tariff from Illinois Bell Telephone Company, Nos. 95-0458 and 95-0531 (consol.) at 63-65 (Illinois Commission June 26, 1996).

1996 Act's definition of a telecommunications service, which includes all telecommunications services provided by an incumbent.

330. We also reject the argument that language in the Joint Explanatory Statement requires us to conclude that carriers must own facilities to obtain access to unbundled elements. Congress may have recognized that carriers that own some of their own facilities will more likely benefit by entering local markets through unbundled elements rather than resale, but this consideration does not imply that carriers must own their own facilities to obtain access to unbundled elements.[708]

331. We are not persuaded that, in order to give meaning and effect to section 251(c)(4), we must require new entrants to own some local exchange facilities in order to obtain access to unbundled elements. We disagree with the premise that no carrier would consider entering local markets under the terms of section 251(c)(4) if it could use recombined network elements solely to offer the same or similar services that incumbents offer for resale. We believe that sections 251(c)(3) and 251 (c)(4) present different opportunities, risks, and costs in connection with entry into local telephone markets, and that these differences will influence the entry strategies of potential competitors. We therefore find that it is unnecessary to impose a limitation on the ability of carriers to enter local markets under the terms of section 251(c)(3) in order to ensure that section 251(c)(4) retains functional validity as a means to enter local phone markets.

332. The principal distinction between sections 251 (c)(3) and 251(c)(4), in terms of the opportunities each section presents to new entrants, is that carriers using solely unbundled elements, compared with carriers purchasing services for resale, will have greater opportunities to offer services that are different from those offered by

---

[708] *See* Joint Explanatory Statement at 148.

incumbents. More specifically, carriers reselling incumbent LEC services are limited to offering the same service an incumbent offers at retail. This means that resellers cannot offer services or products that incumbents do not offer. The only means by which a reseller can distinguish the services it offers from those of an incumbent is through price, billing services, marketing efforts, and to some extent, customer service. The ability of a reseller to differentiate its products based on price is limited, however, by the margin between the retail and wholesale price of the product.

333. In contrast, a carrier offering services solely by recombining unbundled elements can offer services that differ from those offered by an incumbent. For example, some incumbent LECs have capabilities within their networks, such as the ability to offer Centrex, which they do not use to offer services to consumers. Carriers purchasing access to unbundled elements can offer such services. Additionally, carriers using unbundled elements can bundle services that incumbent LECs sell as distinct tariff offerings, as well as services that incumbent LECs have the capability to offer, but do not, and can market them as a bundle with a single price. The ability to package and market services in ways that differ from the incumbent's existing service offerings increases the requesting carrier's ability to compete against the incumbent and is likely to benefit consumers.[709] Additionally, carriers solely using unbundled network elements can offer exchange access services. These services, however, are not available for resale under section 251(c)(4) of the 1996 Act.[710]

334. If a carrier taking unbundled elements may have greater competitive opportunities than carriers offering services available for resale, they also face greater risks.

---

[709] *See* AT&T comments at 25-31.

[710] *See infra*, Section VII; *see also* Letter from Bernard J. Ebbers, President LDDS WorldCom, to Rachelle B. Chong, Commissioner, Federal Communications Commission, July 11, 1996.

A carrier purchasing unbundled elements must pay for the cost of that facility, pursuant to the terms and conditions agreed to in negotiations or ordered by states in arbitrations.[711] It thus faces the risk that end-users customers will not demand a sufficient number of services using that facility for the carrier to recoup its cost. (Many network elements can be used to provide a number of different services.) A carrier that resells an incumbent LEC's services does not face the same risk. This distinction in the risk borne by carriers entering local markets through resale as opposed to unbundled elements is likely to influence the entry strategies of various potential competitors. Some new entrants will be unable or unwilling to bear the financial risks of entry by means of unbundled elements and will choose to enter local markets under the terms of section 251(c)(4) irrespective of the fact that they can obtain access to unbundled elements without owning any of their own facilities.[712] Moreover, some markets may never support new entry through the use of unbundled elements because new entrants seeking to offer services in such markets will be unable to stimulate sufficient demand to recoup their investment in unbundled elements. Accordingly, in these markets carriers will enter through the resale of incumbent LEC services, irrespective of the fact that they could enter exclusively through the use of unbundled elements.[713]

335. We are not persuaded by the argument set forth by Ameritech, NYNEX, and MFS that allowing carriers to use solely recombined network elements would eviscerate the joint marketing restriction in section 271 (e)(1).[714] It is true that the terms of section 271(e) do

---

711 *See infra*, Section VII, describing the terms under which new entrants will pay for the cost of unbundled elements.

712 *See, e.g.*, AT&T reply at 13-20.

713 *See, e.g.*, Comptel reply at 13-16.

714 Section 271(e)(1) provides that "[u]ntil a Bell operating company is authorized pursuant to subsection (d) to provide inter-

not restrict joint marketing through the use of unbundled elements pursuant to section 251(c)(3). As discussed above, differences in opportunities and risk will cause some new entrants to consider entering local telephone markets through resale of incumbent LEC services, even if they could enter solely through the use of unbundled elements. Thus, we conclude that section 271(e)(1) will impose a meaningful limitation on joint marketing.

336. We note, moreover, that the 1996 Act does not prohibit all forms of joint marketing. For example, it does not prohibit carriers who own local exchange facilities from jointly marketing local and interexchange service. Nor does it prohibit joint marketing by carriers who provide local exchange service through a combination of local facilities which they own or possess, and unbundled elements. Because the 1996 Act does not prohibit all forms of joint marketing, we see no principled basis for reading into section 721(e)(1) a further limitation on the ability of carriers to jointly market local and long distance services without concluding that this section prohibits all forms of joint marketing. In other words, we see no basis upon which we could conclude that section 271(e)(1) restricts joint marketing of long distance services, and local services provided solely through the use of unbundled network elements, without also concluding that the section restricts the ability of carriers to jointly market long distance services and local services that are provided through a combination of a carriers' own facilities and unbundled network elements.[715] Moreover, we do not believe that we have

---

LATA services in an in-region State, or until 36 months have passed since the date of enactment . . . a telecommunications carrier that serves greater than 5 percent of the Nation's presubscribed access lines may not jointly market in such State telephone exchange service obtained from such company pursuant to section 251(c)(4) with interLATA services." 47 U.S.C. § 271(e)(1).

[715] *See also* AT&T reply at 14-15 (the added risk of unbundled elements also means that new entrants are not circumventing section 271's joint marketing restriction because the additional risk

the discretion to read into the 1996 Act a restriction on competition which is not required by the plain language of any of its sections.

337. We also reject the argument advanced by BellSouth and Ameritech that allowing carriers to use solely unbundled elements to provide services available through resale would allow carriers to evade a possible prohibition, which is reserved to the discretion of the states, on the sale of certain services to certain categories of consumers. Under section 251(c)(4)(B) states are permitted to restrict resellers from offering certain services to certain consumers, in the same manner that states restrict incumbent LECs.[716] For example, states that prohibit incumbent LECs from selling to business consumers residential services priced below cost have the ability to restrict resellers from selling such services to business consumers.

338. We do not believe, however, that carriers using solely unbundled elements to provide local exchange services will be able to evade any potential restrictions states may impose under section 251(c)(4)(B). In this section Congress granted the states the discretion to impose certain limited restrictions on the sale of services available for resale. It did not, however, grant states, in section 251(c)(3), the same discretion to impose similar restrictions on the use of unbundled elements. Accordingly, we are not persuaded that allowing carriers to use solely unbundled elements to provide services that incumbent LECs offer for resale would allow competing carriers to evade a possible marketing restriction that Congress intended to reserve to the discretion of the states.

339. We agree with those commenters who argue that it would be administratively impossible to impose a re-

---

justifies allowing carriers more flexibility to jointly market services); LDDS reply at 28-30.

[716] 47 U.S.C. § 251(c)(4)(B).

quirement that carriers must own some of their own local exchange facilities in order to obtain access to unbundled elements, and they must use these facilities, in combination with unbundled elements, for the purpose of providing local services. We conclude that it would not be possible to identify the elements carriers must own without creating incentives to build inefficient network architectures that respond not to marketplace factors, but to regulation. We further conclude that such a requirement could delay possible innovation. These effects would diminish competition for local telephone services, and thus any local exchange facilities requirement would be inconsistent with the 1996 Act's goals of promoting competition. Moreover, if we imposed a facilities ownership requirement that attempted to avoid these competitive pitfalls, it would likely be so easy to meet it would ultimately be meaningless.

340. We reject the argument that requiring carriers to own some local exchange facilities would promote competition for local exchange services, or that we should impose such a requirement for other policy reasons. To the contrary, we conclude that allowing carriers to use unbundled elements as they wish, subject only to the maintenance of the key elements of the access charge regime, described below at section VII, will lead to more efficient competition in local phone markets. If we were to limit access to unbundled network elements to those markets where carriers already own, or could efficiently build, some local exchange facilities, we would limit the ability of carriers to enter local markets under the pricing standard for unbundled elements to those markets that could efficiently support duplication of some or all of the incumbent LECs' networks. We believe that such a result could diminish competition, and that allowing new entrants to take full advantage of incumbent LECs' scale and scope economies will promote more rapid and efficient entry and will result in more robust competition.

341. Finally, we conclude that a new entrant may offer services to one group of consumers using unbundled network elements, and it may offer services to a separate group of consumers by reselling an incumbent LEC's services. With the exception noted in Section VII, *infra*, we do not address the issue of whether the 1996 Act permits a new entrant to offer services to the same set of consumers through a combination of unbundled elements and services available for resale.

* * * *

3. Discussion

356. We confirm our tentative conclusion in the NPRM that section 251(c)(3) permits interexchange carriers and all other requesting telecommunications carriers, to purchase unbundled elements for the purpose of offering exchange access services, or for the purpose of providing exchange access services to themselves in order to provide interexchange services to consumers.[761] Although we conclude below that we have discretion under the 1934 Act, as amended by the 1996 Act, to adopt a limited, transitional plan to address public policy concerns raised by the bypass of access charges via unbundled elements, we believe that our interpretation of section 251(c)(3) in the NPRM is compelled by the plain language of the 1996 Act. As we observed in the NPRM, section 251 (c)(3) provides that requesting telecommunications carriers may seek access to unbundled elements to provide a "telecommunications service," and exchange access and interexchange services are telecommunications services. Moreover, section 251(c)(3) does not impose restrictions on the ability of requesting carriers "to combine such elements in order to provide such telecommunications service[s]."[762] Thus, we find that there is no statutory basis upon which we could reach a different conclusion for the long term.

---

761 *See* NPRM at paras. 159-65.

762 47 U.S.C. § 251(c)(3).

357. We also confirm our conclusion in the NPRM that, for the reasons discussed below in section V.J, carriers purchase rights to exclusive use of unbundled loop elements, and thus, as the Department of Justice and Sprint observe, such carriers, as a practical matter, will have to provide whatever services are requested by the customers to whom those loops are dedicated. This means, for example, that, if there is a single loop dedicated to the premises of a particular customer and that customer requests both local and long distance service, then any interexchange carrier purchasing access to that customer's loop will have to offer both local and long distance services. That is, interexchange carriers purchasing unbundled loops will most often not be able to provide solely interexchange services over those loops.

358. We reject the argument advanced by a number of incumbent LECs that section 251(i) demonstrates that requesting carriers using unbundled elements must continue to pay access charges. Section 251(i) provides that nothing in section 251 "shall be construed to limit or otherwise affect the Commission's authority under section 201."[763] We conclude, however, that our authority to set rates for these services is not limited or affected by the ability of carriers to obtain unbundled elements for the purpose of providing interexchange services. Our authority to regulate interstate access charges remains unchanged by the 1996 Act. What has potentially changed is the volume of access services, in contrast to the number of unbundled elements, interexchange carriers are likely to demand and incumbent LECs are likely to provide. When interexchange carriers purchase unbundled elements from incumbents, they are not purchasing exchange access "services." They are purchasing a different product, and that product is the right to exclusive access or use of an entire element. Along this same line of reasoning, we reject the argument that our conclusion would place the

---

763 47 U.S.C. § 251(i).

administration of interstate access charges under the authority of the states. When states set prices for unbundled elements, they will be setting prices for a different product than "interstate exchange access services." Our exchange access rules remain in effect and will still apply where incumbent LECs retain local customers and continue to offer exchange access services to interexchange carriers who do not purchase unbundled elements, and also where new entrants resell local service.[764]

359. We also reject the incumbent LECs' arguments that language contained in bills that were not enacted, or legislative history connected to such bills, demonstrates that carriers cannot purchase access to unbundled elements to provide exchange access services to themselves, for the purpose of providing long distance services to consumers. The incumbent LECs are arguing in effect, that we should read into the current statute a limitation on the ability of carriers to use unbundled network elements, despite the fact that no such limitation survived the Conference Committee's amendments to the 1996 Act. We conclude, however, that the language of section 251(c)(3), which provides that telecommunications carriers may purchase unbundled elements in order to provide a telecommunications service [765] is not ambiguous. Accordingly, we must interpret it pursuant to its plain meaning and not by referencing earlier versions of the statute that were ultimately not adopted by Congress.

360. Moreover, we do not believe that the Joint Explanatory Statement, which describes the House and Senate versions of the statute, and the 1996 Act as enacted, compels a different conclusion. The Joint Explanatory Statement states that the statute incorporates provisions

---

[764] The application of our exchange access rules in the circumstances described will continue beyond the transition period described at *infra*, Section VII.

[765] 47 U.S.C. § 251(c)(3).

from the Senate Bill and the House Amendment in connection with the interconnection model adopted in section 251.[766] It notes that the provision in the Senate Bill relating to interconnection did not apply to interconnection arrangements between local and long distance carriers for the purpose of providing long distance services.[767] The text of section 251 of the Senate Bill is consistent with this comment because it states that a local exchange carrier must offer interconnection to other carriers to allow such carriers to provide telephone exchange or exchange access services.[768] The Joint Explanatory Statement, however, does not describe any restriction in the House Amendment regarding the ability of carriers to use unbundled elements to provide long distance service.[769] Indeed, the House Amendment specifically states that carriers may obtain access to unbundled elements to offer "a telecommunications service," which is not limited to telephone exchange and exchange access services.[770] We observe that the Conference Committee incorporated language from the House Amendment and not the Senate Bill in describing in section 251(c)(3) the services carriers may offer using unbundled elements. Accordingly, we do not believe that the Joint Explanatory Statement's description of the provision in the Senate Bill controls our interpretation of section 251(c)(3) as enacted.

361. We also reject the argument that allowing carriers to use unbundled elements to provide originating and terminating toll services is inconsistent with the purposes of the 1996 Act. Congress intended the 1996 Act to promote competition for not only telephone exchange services

---

766 Joint Explanatory Statement at 117-123.

767 *Id.* at 117.

768 S. 652, 104th Cong., 1st Sess. § 251 (1995).

769 Joint Explanatory Statement at 120-121.

770 H.R. 1555, 104th Cong., 1st. Sess. § 242 (1995).

and exchange access services, but also for toll services. Section 251(b)(3), for example, imposes a duty on LECs to provide dialing parity for telephone toll service.

362. We disagree with the incumbent LECs which argue that section 251(g) requires requesting carriers using unbundled elements to continue to pay federal and state access charges indefinitely. Section 251(g) provides that the federal and state equal access rules applicable before enactment, including the "receipt of compensation," will continue to apply after enactment, "until such restrictions and obligations are explicitly superseded by regulations prescribed by the Commission after such date of enactment." [771] We believe this provision does not apply to the exchange access "services" requesting carriers may provide themselves or others after purchasing unbundled elements. Rather, the primary purpose of section 251(g) is to preserve the right of interexchange carriers to order and receive exchange access services if such carriers elect not to obtain exchange access through their own facilities or by means of unbundled elements purchased from an incumbent.

363. We affirm our tentative conclusion in the NPRM that, telecommunications carriers purchasing unbundled network elements to provide interexchange services or exchange access services are not required to pay federal or state exchange access charges except as described in section VII, *infra*, for a temporary period. As we explained in the NPRM, if we were to require indefinitely carriers purchasing unbundled elements to also pay access charges, then incumbent LECs would receive compensation in excess of their underlying network costs. This result would be inconsistent with the pricing standard for unbundled elements set forth in section 252(d)(1).[772] In addition,

---

[771] 47 U.S.C. § 251(g).

[772] *See infra*, Section VII. We also note that where new entrants purchase access to unbundled network elements to provide exchange

we believe this conclusion is consistent with Congress's overriding goal of promoting efficient competition for local telephony services, because it will allow, in the long term, new entrants using unbundled elements to compete on the basis of the economic costs underlying the incumbent LEC's networks. The facilities used to provide exchange access services are the same as those used to provide local exchange services. We note, however, as discussed below,[773] that certain additional charges are necessary for a specific, limited duration to smooth the transition to a competitive marketplace.

364. We further conclude that when a carrier purchases a local loop for the purpose of providing interexchange services or exchange access services,[774] incumbent LECs may not recover the subscriber line charge (SLC) now paid by end users. The SLC recovers the portion of loop costs allocated to the interstate jurisdiction, but as discussed in Section II.C, *supra*, we conclude that the 1996 Act creates a new jurisdictional regime outside of the current separations process. The unbundled

---

access services, whether or not they are also offering toll services through such elements, the new entrants may assess exchange access charges to IXCs originating or terminating toll calls on those elements. In these circumstances, incumbent LECs may not assess exchange access charges to such IXCs because the new entrants, rather than the incumbents, will be providing exchange access services, and to allow otherwise would permit incumbent LECs to receive compensation in excess of network costs in violation of the pricing standard in section 252(d). *See* 47 U.S.C. § 252. We further note, however, that in these same circumstances the new entrant purchasing access to an unbundled switch element must pay to the incumbent LEC the charges included in the transitional mechanism, described *infra*, at Section VII, for a temporary period.

773 *See infra*, Section VII, discussing an interim mechanism addressing near-term access charge bypass.

774 As discussed at *infra*, Section VIII, a different result will occur when interconnecting carriers purchase LEC retail services at wholesale rates under section 251(c)(4).

loop charges paid by new entrants under section 251 (c)(3) will therefore recover the unseparated cost of the loop, including the interstate component now recovered through the SLC. If end users or carriers purchasing access to local loops were required to pay the SLC in this situation, LECs would enjoy double recovery, and the effective price of unbundled loops would exceed the cost-based levels required under section 251(d)(1).

365. Finally, we have considered the economic impact on small incumbent LECs of our conclusion that carriers purchasing access to unbundled network elements to provide interexchange or exchange access services are not required to pay federal or state access charges, except as described in Section VII, *infra*, for a temporary period. For example, the Rural Telephone Coalition argues that rural ratepayers could be subject to higher local service rates if interexchange carriers are allowed to bypass access charges through the purchase of unbundled elements before proceedings regarding access reform and universal service are completed. We reject the Rural Telephone Coalition's argument, however, because our rules, as discussed in Section VII, *infra*, provide for a limited, transitional plan to address public policy concerns raised by the bypass of access charges through unbundled network elements.

* * * *

c. Discussion

377. We conclude that incumbent LECs must provide local loops on an unbundled basis to requesting carriers. We note that the Joint Explanatory Statement lists local loops as an example of an unbundled network element.[816] As discussed below, the record demonstrates that it is technically feasible for incumbent LECs to provide access to unbundled local loops, and that such access is

---

[816] Joint Explanatory Statement at 116.

critical to encouraging market entry. Further, the competitive checklist contained in section 271 requires BOCs to offer unbundled loops separate from switching as a precondition to entry into the in-region, interLATA services market.[817]

* * * *

380. We further conclude that the local loop element should be defined as a transmission facility between a distribution frame, or its equivalent, in an incumbent LEC central office, and the network interface device at the customer premises. This definition includes, for example, two-wire and four-wire analog voice-grade loops, and two-wire and four-wire loops that are conditioned to transmit the digital signals needed to provide services such as ISDN, ADSL, HDSL, and DS1-level signals.[823] We note that a number of parties proposed definitions of the local loop that encompassed some or all of these loop types.[824] In addition, we agree with ITIC that the ability to offer various digital loop functions in competition with incumbent LECs may be particularly beneficial to small entities by allowing them to serve niche markets.[825]

* * * *

---

[817] 47 U.S.C. § 271(c)(2)(B).

[823] ISDN (Integrated Services Digital Network) at the Basic Rate Interface level permits the transmission of digital signals over the loop at the rate of 144 kbps, which provides two standard 64 kbps voice or data channels and a 16 kbps data channel. ISDN at the Primary Rate Interface permits 23 standard 64 kbps channels plus one 16 kbps data channel. ADSL (Asynchronous Digital Subscriber Line) is a transmission path that facilitates 6 Mbps digital signal downstream and 640 kbps digital signal upstream, while simultaneously carrying an analog voice signal. Two-wire HDSL (High-bit-rate Digital Subscriber Line) permits the transmission of a 768 kbps digital signal over a copper loop, while four-wire HDSL allows the transmission of 1,544 Mbps over two two-wire pairs.

[824] *See, e.g.*, MFS comments at 43-44; ALTS comments at 27; GST comments at 21-22; ACSI comments, Att. 1 at 2.

[825] ITIC comments at 7-8.

382. Our definition of loops will in some instances require the incumbent LEC to take affirmative steps to condition existing loop facilities to enable requesting carriers to provide services not currently provided over such facilities. For example, if a competitor seeks to provide a digital loop functionality, such as ADSL, and the loop is not currently conditioned to carry digital signals, but it is technically feasible to condition the facility, the incumbent LEC must condition the loop to permit the transmission of digital signals. Thus, we reject BellSouth's position that requesting carriers "take the LEC networks as they find them" with respect to unbundled network elements.[828] As discussed above, some modification of incumbent LEC facilities, such as loop conditioning, is encompassed within the duty imposed by section 251 (c)(3).[829] The requesting carrier would, however, bear the cost of compensating the incumbent LEC for such conditioning.[830]

* * * *

384. We find that it is technically feasible to unbundle IDLC-delivered loops. One way to unbundle an individual loop from an IDLC is to use a demultiplexer to separate the unbundled loop(s) prior to connecting the remaining loops to the switch. Commenters identify a number of other methods for separating out individual loops from IDLC facilities, including methods that do not require demultiplexing.[831] Again, the costs associated with these mechanisms will be recovered from requesting carriers.

* * * *

---

[828] BellSouth comments at 39.

[829] *See supra* Section IV.D., interpreting the term "technically feasible." *See also* MFS comments at 43 (arguing that incumbent LECs condition loops in order to provide particular digital loop functionalities to their customers).

[830] *See supra* Section VII, discussing the recovery of costs under section 252(d)(1).

[831] Under more recent standards for IDLC facilities, a competitor's loop traffic could be separated from the incumbent LEC's loop

388. Section 251(d)(2)(A) requires the Commission to consider whether "access to such network elements as are proprietary in nature is necessary."[835] Most parties did not identify any proprietary concerns associated with providing unbundled access to local loops. Ericsson notes that some "active" loop equipment, such as channel banks and remote terminal equipment, is often proprietary in nature, and that manufacturers would require time to modify such equipment to create end-to-end network compatibility on a national basis.[836] Ericsson does not contend, however, that any proprietary information would be revealed if loops using such equipment were unbundled, or that use of such equipment should prevent loop unbundling in general.[837] Thus, we conclude that loop elements are, in general, not proprietary in nature under our interpretation of section 251(d)(2)(A). Even if loop elements were proprietary in nature, however, Ericsson does not meet the second consideration in our section 251(d)(2)(A) standard, which requires a showing that a new entrant can offer the proposed telecommunications service through the use of other, nonproprietary elements in the incumbent LEC's network.[838] Ericsson merely contends that manufacturers may need time to establish compatibility between its proprietary equipment and equipment of other manufacturers.[839] Therefore, we find that Ericsson's concerns do not justify withholding unbun-

---

traffic without the use of multiplexers. *See, e.g.*, MCI comments at 30 (IDLC loops can be moved onto other loop carrier links, or alternatively, can be removed from the multiplexed signal through "hair pinning").

[835] 47 U.S.C. § 251(d)(2)(A).

[836] Ericsson comments at 4.

[837] Ericsson's comments were in response to a question in the NPRM seeking comment on the need to accommodate new loop technologies or services. Ericsson comments at 4.

[838] *See supra* Section V.E.3.

[839] Ericsson comments at 4-5.

dled loops from requesting carriers pursuant to section 251(d)(2)(A).

389. Section 251(d)(2)(B) directs the Commission to consider whether "the failure to provide access to such network elements would impair the ability of the telecommunications carrier seeking access to provide the services that it seeks to offer." [840] We have interpreted the term "impair" to mean either increased cost or decreased service quality that would result from using network elements of the incumbent LEC other than the one sought.[841] Commenters do not identify alternative facilities that would fulfill requesting carriers' need for transmission between the central office and the customer premises at the same cost and same quality of service. Accordingly, we conclude that competitors' ability to provide telephone exchange, exchange access, or other telecommunications services would be significantly impaired if they did not have the opportunity to purchase unbundled loops from incumbent LECs.

* * * *

392. We require incumbent LECs to offer unbundled access to the network interface device (NID),[852] as a network element, as described below. When a competitor deploys its own loops, the competitor must be able to connect its loops to customers' inside wiring in order to provide competing service, especially in multi-tenant buildings. In many cases, inside wiring is connected to the incumbent LEC's loop plant at the NID. In order to provide service, a competitor must have access to this facility. Therefore, we conclude that a requesting carrier

---

840 47 U.S.C. § 251(d)(2)(B).

841 *See supra* Section V.E.3.

852 The NID is a cross-connect device used to connect loop facilities to inside wiring.

is entitled to connect its loops, via its own NID, to the incumbent LEC's NID.[853]

393. Pursuant to section 251(c)(3), we find that this arrangement clearly is technically feasible. Ameritech notes that it currently maintains such connections with competitors that have deployed their own loop facilities.[854] This is persuasive evidence that unbundled access at the NID, in this manner, does not raise network reliability concerns. Under section 251(d)(2)(A), the record contains no evidence of proprietary concerns with unbundled access to the NID. In addition, under our interpretation of the "impair" test of section 251(d)(2)(B), commenters do not contend that new entrants could obtain the same functionality at the same cost and service quality through other network elements of the incumbent LEC. Moreover, the record indicates that certain network architectures used by new entrants, such as fiber rings, can most efficiently connect end users to the new entrant's switching office without use of the incumbent LEC's facilities.[855] Thus, we conclude that the unavailability of access to incumbent LECs' NIDs would impair the ability of carriers deploying their own loops to provide service. Further, we believe that unbundled access to the NID will facilitate entry strategies premised on the deployment of loops. As discussed in section VII, above, the new

---

853 We emphasize that access to inside wiring through the incumbent LEC's NID does not entitle a competitor to deliver its loop facilities into a building without the permission of the building owner. Similarly, access to an incumbent LEC's NID does not entitle the competitor to the riser and lateral cables between the NID and individual units within the building, which may be owned or controlled, for example, by the premises owner.

854 Letter from James K. Smith, Director-Federal Relations, Ameritech, to William F. Caton, Acting Secretary, FCC, July 15, 1996 (Ameritech July 15 *Ex Parte*).

entrant bears the costs connecting its NID to the incumbent LEC's NID.

* * * *

2. Switching Capability

a. Background

397. In the NPRM, we tentatively concluded that incumbent LECs should be required to make available local switching capability as an unbundled network element. We sought comment on how a local switching element should be defined, and we identified two possible models: the switch "platform" approach, which would entitle and require a requesting carrier to purchase all of the features and functions of the switch on a per-line basis and the port approach used by the New York Commission, which offers local switching capability through the purchase of a port at a retail rate. We also sought comment on other definitions of a local switching element. In addition, we requested that commenters address whether vertical switching functions, such as those enabling the provision of custom local area signaling service (CLASS) features and call waiting, should be considered individual network elements separate from the basic switching functionality.

b. Comments

398. The vast majority of commenters support the Commission's tentative conclusion that local switching should be an unbundled network element.[865] Such parties note that the section 271 competitive checklist includes unbundled local switching and the legislative history of the 1996 Act identifies local switching as a possible ele-

---

[865] *See, e.g.*, GCI comments at 12; TIA comments at 11-12; Citizens Utilities comments at 15; Intermedia comments at 13; Bay Springs, *et al.* comments at 18; Wyoming Commission comments at 22.

ment.[866] Several potential local competitors contend that unbundled local switching functionality is very important to promote entry into the local exchange market.[867]

399. Some incumbent LECs support a definition of local switching as a switching port.[868] These LECs favor a definition of a port that focuses on *providing access* to additional switching features, rather than on the switching features themselves.[869] PacTel, for example, asserts that a port provides dialtone and a telephone number, but does not include local usage or vertical features such as custom calling.[870] Bell Atlantic contends that the 1996 Act requires incumbent LECs to *provide access* to unbundled network elements, and that a switch port meets this directive by providing access to the switch.[871]

400. Sprint, USTA, SBC, NYNEX, and MECA, on the other hand, favor a definition of the unbundled local switching element that includes the basic function of connecting network access lines to other lines or trunks.[872]

[872] Sprint comments at 34; USTA reply at 16-17; SBC reply at 20; NYNEX reply at 31; MECA comments at 29.

These parties would expressly exclude from this local switching definition vertical features such as custom calling.[873] Sprint and SBC argue that vertical features are retail services offered to end users today, and therefore, must be purchased by the competitor under the wholesale rate provisions of the Act.[874] USTA suggests that this approach best comports with the Act and is a reasonable compromise between the more limited port approach and the switching platform proposal.[875]

401. A number of commenters support a definition of the local switch that has been referred to as the "local switching platform."[876] These parties recommend defining the local switching element as encompassing all functions performed by the local switch, including basic switching functionality and vertical features.[877] Supporters

---

[873] Sprint comments at 36; USTA reply at 16; SBC reply at 20; MECA comments at 29. Exemples of vertical features include call waiting and three-way calling, which are custom calling features, and caller ID and call forwarding, which are custom local area signaling service (CLASS) features that rely on the transmission of signaling information between the calling and called parties.

[874] USTA reply at 16-17; PacTel reply at 19; SBC reply at 21; *see also* Sprint comments at 37-38 (although it is not technically feasible to unbundle vertical services, the costs of such services can be identified and should be excluded from the charge for the local switching element).

[877] Functions listed by proponents of the switch platform include local usage, exchange access, access to operators, announcements, recognition of customer requests for service, obtaining call-specific information, data analysis, selection of traffic routes, call signaling, recording for billing and network management, tests required for network maintenance and call processing, custom calling features (*e.g.* call forwarding, call waiting), and CLASS features (*e.g.* caller

of the switching platform approach contend that, because the requesting carrier would pay for all local switching functionality on a per-line basis, it would have the incentive and ability to combine features and services more effectively than it would under more limited definitions of the local switching element.[878]

402. LDDS and AT&T argue that the switch platform approach is more consistent with the Act than the port approach. These carriers argue that, under the port approach, local switching has not been "unbundled" because a competitor cannot combine a port with loop and trunking facilities to provide telephone service. Instead, the competitor must also purchase basic switching functionality from the incumbent LEC at wholesale rates.[879] According to AT&T and LDDS, the switching platform does not raise technical feasibility problems because requesting carriers would not have direct access to the switching hardware or software. Instead, the requesting carrier would "designate" the features to be associated with its own lines and the routing of its customers' calls, and the incumbent LEC would actually perform that function.[880]

403. Opponents of the local switching platform assert that implementing a switch platform would cause technical problems. U S West and GVNW argue that the

[880] AT&T reply at 19; LDDS reply at 19.

only technically feasible way to implement the switching platform would be physically to partition the switch which, according to U S West, would greatly reduce the switch's efficiency.[881] AT&T characterizes this argument as frivolous and asserts that physical partitioning of the switch has not been proposed by any party.[882] NYNEX contends that incumbent LECs would need to add capacity to their switches to accommodate competitors' demand for switch platforms.[883] AT&T responds that, because the requesting carrier is likely to be serving former customers of the incumbent LEC, the switching resources needed by the incumbent and competitor, at least initially, are likely to balance out.[884] GTE, U S West, and USTA also argue that the switching platform approach would discourage incumbent LECs from upgrading their switches because all new features would be immediately available to competitors at a discounted rate.[885]

404. Incumbent LECs argue that the switch platform would allow a requesting carrier to circumvent the statutory scheme that requires incumbent LECs to offer local exchange service at wholesale rates for resale by requesting carriers.[886] These commenters also contend that vertical features, such as custom calling and call waiting, are retail services, not network elements, and should be obtained by requesting carriers pursuant to section 251

(c)(4).[887] Ad Hoc Telecommunications Users maintains that the switch platform approach raises entry costs by forcing competitive providers to purchase switching functions they may never need or use.[888] MCI and TCC contend that the local switching element should specifically include vertical features such as CLASS features and custom calling because incumbent LECs do not incur the costs for these services on a usage basis.[889] ACSI and LCI also support the availability of vertical switching functionalities on an unbundled basis.[890]

405. Incumbent LECs contend that the switch platform approach is impractical because standard measures of switching, such as the number of line or trunk terminations, would not capture the dynamic nature of switching.[891] In response, MCI and LDDS state that a requesting carrier would commit to purchasing a minimum level of trunk port capacity and a minimum level of busy hour switch capacity for at least one year.[892] Several BOCs and Sprint contend that the Commission should not adopt the switch platform because there is insufficient understanding of what it would entail.[893]

406. Most parties support the Commission's proposal to require incumbent LECs to unbundle tandem switching as a network element.[894] AT&T notes that the availability

of unbundled tandem switches is critical to the connection of its own switches to incumbent LECs' switches.[895] AT&T argues that unbundled tandem switching is technically feasible because IXCs currently interconnect with incumbent LECs' tandem switches through standard specifications.[896] Other commenters indicate that tandem switching is available today through access tariffs, and therefore it is unnecessary for the Commission to unbundle tandem switching.[897] SBC states that the Commission should not apply the same unbundling requirements for tandem and end office switches because tandem switches only offer trunk interfaces and do not contain switching features on a per-line basis.[898]

407. AT&T, MCI, and TCC also ask that the local switching element be defined to include data switching by packet switches.[899] MCI asserts that it is technically feasible for the requesting carrier's own facilities to interface with an incumbent LEC's packet switch through a connection at a DS1 frame or patch panel.[900] PacTel supports the unbundling of data switches as network elements.[901]

408. Several potential local competitors argue that the Commission should require incumbent LECs, in providing unbundled local switching, to enable requesting carriers to designate the trunk assignment for its local exchange customers.[902] CompTel states that this would maximize

competitors' ability to create new services.[903] PacTel argues that it is not technically feasible to route local calls originating on unbundled loops onto particular outgoing trunks connected to that switch.[904]

409. ALTS argues that incumbent LECs should be required to make local switching available so that all signaling information necessary to complete a call is passed to the connecting carrier, such as an IXC or a competing provider.[905] The Wyoming Commission is considering adoption of a rule that would require incumbent LECs to pass on signaling information to interconnected carriers, and would also prohibit incumbent LECs from claiming a proprietary right to signaling protocols.[906]

c. Discussion

(1) Local Switching Capability

410. We conclude that incumbent LECs must provide local switching as an unbundled network element. The record supports a finding that it is technically feasible for incumbent LECs to provide access to an unbundled local switching element, and that denying access to a local switching element would substantially impair the ability of many competing carriers to provide switched telecommunications services. We also note that section 271 re-

---

mission should enable requesting carriers to establish routing parameters for the following categories of traffic: domestic interLATA, presubscribed intraLATA, non-presubscribed intraLATA, 800/888, 900, interLATA operator traffic, intraLATA/0-/0+ operator traffic, and international direct dialed).

[903] CompTel comments at 34.

[904] PacTel reply at 20.

[905] ALTS comments at 29 (claiming that some carriers strip certain signaling information and end offices and tandem offices, thereby undermining the ability of new entrants to receive and aggregate traffic for various IXCs).

[906] Wyoming Commission comments at 24.

quires BOCs to offer or provide "[l]ocal switching unbundled from transport, local loop transmission, or other services" as a precondition to providing in-region inter-LATA services.[907] As discussed below, we identify a local switching element that includes the basic function of connecting lines and trunks as well as vertical switching features, such as custom calling and CLASS features.[908] We agree with the Illinois Commission that defining the switching element in this way will permit competitors to compete more effectively by designing new packages and pricing plans.[909]

411. In the United States, there are over 23,000 central office switches, the vast majority of which are operated by incumbent LECs.[910] It is unlikely that consumers would receive the benefits of competition quickly if new entrants were required to replicate even a small percentage of incumbent LECs' existing switches prior to entering the market. The Illinois Commission staff presented evidence in a recent proceeding indicating that it takes between nine months and two years for a carrier to purchase and install a switch.[911] We find this to be persuasive evi-

---

[907] 47 U.S.C. § 271(c)(2)(B)(vi).

[908] Custom calling features, such as call waiting, three-way calling, and call forwarding, are switch-based calling functions. CLASS features, such as caller ID, are number translation services that are based on the availability of interoffice signaling.

[910] *Statistics of Communications Common Carriers*, Federal Communications Commission, 1994/1995 Edition, at Table 2.4. This figure is derived from carriers filing with the FCC, which represent approximately 92 percent of the industry.

[911] Supplemental Rebuttal Testimony of Jake Jennings, Office of Policy and Planning, Illinois Commerce Commission, ICC Staff Ex. 1.04, Docket No. 95-0458, at 11-12 (Mar. 11, 1996).

dence of the entry barrier that would be created if new entrants were unable to obtain unbundled local switching from the incumbent LEC. The ability to purchase unbundled switching will also promote competition in an area until the new entrant has built up a sufficient customer base to justify investing in its own switch. We expect that the availability of unbundled local switching is likely to increase the number of carriers that will successfully enter the market, and thus should accelerate the development of local competition.

412. We define the local switching element to encompass line-side and trunk-side facilities plus the features, functions, and capabilities of the switch.[912] The line-side facilities include the connection between a loop termination at, for example, a main distribution frame (MDF), and a switch line card.[913] Trunk-side facilities include the connection between, for example, trunk termination at a trunk-side cross-connect panel and a trunk card. The "features, functions, and capabilities" of the local switch include the basic switching function of connecting lines to lines, lines to trunks, trunks to lines, trunks to trunks. It also includes the same basic capabilities that are available to the incumbent LEC's customers, such as a telephone number, directory listing, dial tone, signaling, and access to 911, operator services, and directory assist-

---

[912] The NPRM used the terms "switch platform" and "port," as they had been developed by the Illinois and New York Commissions, respectively, to describe two possible approaches to establishing an unbundled local switching element. Parties commenting on the unbundled switching element attributed a variety of functionalities to each of these terms. To avoid confusion, we will not use these terms in discussing the unbundled local switching element. Instead, we will address commenters' proposals according to the functionality that they recommend be included in the definition of an unbundled local switching element.

[913] A line card is a plug-in electronic printed circuit card that operates ringing, holding, and other features associated with one or several telephone lines.

ance.[914] In addition, the local switching element includes all vertical features that the switch is capable of providing, including custom calling, CLASS features, and Centrex, as well as any technically feasible customized routing functions. Thus, when a requesting carrier purchases the unbundled local switching element, it obtains all switching features in a single element on a per-line basis. A requesting carrier will deploy individual vertical features on its customers' lines by designating, via an electronic ordering interface, which features the incumbent LEC is to activate for particular customer lines.

413. We disagree with commenters who argue that vertical switching features should be classified exclusively as retail services, available to competing providers only through the resale provision of section 251(c)(4).[915] The 1996 Act defines network element as "a facility or equipment used in the provision of a telecommunications service" and "the features, functions, and capabilities that are provided by means of such facility or equipment."[916] Vertical switching features, such as call waiting, are provided through operation of hardware and software comprising the "facility" that is the switch, and thus are "features" and "functions" of the switch.[917] We note that

---

[914] Purchasing the local switching element does not entitle a requesting carrier to connect its own AIN call processing database to the incumbent LEC's switch, either directly or via the incumbent LEC's signal transfer point or database. Section V.I.4, which discusses the unbundling of incumbent LECs' signaling systems and databases. We also note that E911 and operator services are further unbundled from local switching. *See infra* Section V.I.6.

[915] Section 251(c)(4)(A) requires incumbent LECs "to offer for resale at wholesale rates any telecommunications service that the carrier provides at retail to subscribers who are not telecommunications carriers." 47 U.S.C. § 251(c)(4)(A).

[916] 47 U.S.C. § 153(29).

[917] In some cases vertical features may be provided using hardware and software external to the actual switch. In those instances, the functionality of such external hardware and software is a sepa-

the Illinois Commission recently defined an unbundled local switching element to include vertical switching features.[918] Although we find that vertical switching features should be available to competitors through the resale provision of section 251(c)(4), we reject the view that Congress intended for section 251(c)(4) implicitly to remove vertical switching features from the definition of "network element."[919] Therefore, we find that vertical switching features are part of the unbundled local switching element.[920]

414. At this time we decline to require further unbundling of the local switch into a basic switching element and independent vertical feature elements. Such unbundling does not appear to be necessary to promote local competition. Indeed, most potential local competitors do not recommend that vertical switching features be available as separate network elements. MCI, AT&T and LDDS believe that such features should be available to new entrants as part of the local switching element.[921] We also note that additional unbundling of the local switching would not result in a practical difference in the way the local switching element is provisioned. As discussed below, when a competing provider orders the unbundled basic switching element for a particular customer line, it will designate which vertical features should be activated by the incumbent LEC for that line. In addition, the

---

rate element under section 251(c)(3), and is available to competing providers. *See infra* Section V.I.4, discussing unbundled signaling and databases.

[918] *Illinois Wholesale Order* at 63-66.

[919] *See supra* Section V.H, rejecting arguments that services available for resale under section 251(c)(4) cannot be provided via unbundled elements.

[920] *See infra* Section VII.C.2.b.2, concerning the pricing of an unbundled switching element.

[921] AT&T June 28 *Ex Parte* at 1-2; MCI comments at 31; LDDS comments at 44.

record indicates that the incremental costs associated with vertical switching features on a per-line basis may be quite small,[922] and may not justify the administrative difficulty for the incumbent LEC or the arbitrator to determine a price for each vertical element. Thus, states can investigate, in arbitration or other proceedings, whether vertical switching features should be made available as separate network elements. We will continue to review and revise our rules in this area as necessary.

415. We conclude that providing access to an unbundled local switching element at a LEC central office is technically feasible. We are not persuaded by the argument that shared use of an unbundled switching element would jeopardize network security and reliability by permitting competitors independently to activate and deactivate various switching features. A competing provider will purchase and obtain the local switching element the same way it obtains an unbundled local loop, that is, by ordering, via electronic interfaces,[923] the local switching element and particular vertical switching features.[924] The incumbent LEC will receive the order and activate (or deactivate) the particular features on the customer line designated by the competing provider. Consequently, the incumbent LEC is not required to relinquish control over operations of the switch.

416. We also reject the argument that a definition of local switching that incorporates shared use of a local switch would involve physical partitioning of the switch.[925]

---

[922] LDDS comments at 57, Letter from Bruce Cox, Government Affairs Director, AT&T, to Elliot Maxwell, FCC, June 25, 1996 (AT&T June 25 *Ex Parte*).

[923] *See infra* Section V.I.4, *infra*, addressing requesting carriers' access to incumbent LECs' ordering and provisioning systems.

[924] Section V.I.5 addresses the arrangements for ordering unbundled network elements.

[925] U S West comments at 55-57.

The requirements we establish for local switch unbundling do not entail physical division of the switch, and consequently do not impose the inefficiency or technical difficulties identified by some commenters.

417. Nor are we persuaded by the arguments of some incumbent LECs that an unbundled switching element based on shared use of the local switch is technically infeasible because incumbent LECs lack significant excess capacity at any given time. Thus, at least initially, an increase in the use of the local switching element by the requesting carrier is not likely to lead to an enormous, immediate increase in switch use by the incumbent LEC. If incumbent LECs and competing providers believe that they would benefit by quantifying their anticipated demand for switch resources, they are free to do so in the negotiation and arbitration processes. Such planning may be necessary when a competitor anticipates that usage of the local switching element by its customers will place demands on the incumbent LEC's switch that exceed the usage levels anticipated by the incumbent LEC.[926]

418. We conclude that customized routing, which permits requesting carriers to designate the particular outgoing trunks that will carry certain classes of traffic originating from the competing provider's customers, is technically feasible in many LEC switches. Customized routing will enable a competitor to direct particular classes of calls to particular outgoing trunks, which will permit a new entrant to self-provide, or select among other providers of, interoffice facilities, operator services, and directory assistance.[927] Bell Atlantic notes that customized

---

[926] Bell Atlantic, for example, notes that a competitor's service or pricing packages could stimulate greater switch usage than previously experienced by the incumbent. Letter from Patricia Koch, Assistant Vice President, Bell Atlantic, to William Caton, Acting Secretary, FCC, June 21, 1996 (Bell Atlantic June 21 *Ex Parte*).

[927] *See, e.g.*, AT&T June 28 *Ex Parte*. In addition, we note that the Illinois Commission recently directed Ameritech and Centel to

routing is generally technically feasible for local calling, although it notes that the technology and capacity constraints vary from switch to switch.[928] SBC contends that customized routing is technically infeasible for older switches, such as the 1AESS switch.[929] AT&T acknowledges that, although the ability to establish customized routing in 1AESS switches may be affected by the "call load" in each office, only 9.8% of the switches used by the seven RBOCs, GTE and SNET are 1AESS switches.[930] We recognize that the ability of an incumbent LEC to provide customized routing to a requesting carrier will depend on the capability of the particular switch in question. Thus, our requirement that incumbent LECs provide customized routing as part of the "functionality of the local switching element applies, by definition, only to those switches that are capable of performing customized routing. An incumbent LEC must prove to the state commission that customized routing in a particular switch is not technically feasible.

419. Section 251(d)(2)(A) requires the Commission, in determining which network elements should be made available to competing providers, to consider "whether access to such network elements as are proprietary in na-

---

permit a carrier purchasing wholesale local exchange service to designate a provider of operator services and directory assistance other than that of the incumbent LEC. Such access is accomplished through the routing of such calls from the incumbent LEC's switch to the competing provider of the operator service or directory assistance. *See Illinois Wholesale Order* at 45.

[928] Letter from Patricia Koch, Assistant Vice President, Bell Atlantic, to William Caton, Acting Secretary, FCC, June 24, 1996 (Bell Atlantic June 24 *Ex Parte*); *see also* BellSouth comments at 41-42 n.89 (the ability to provide customized routing depends on the quantity of customized routing requests from other competitors).

[929] SBC comments at 41-42.

[930] Letter from Bruce Cox, Government Affairs Director, AT&T, to William F. Caton, Secretary, FCC, July 11, 1996 (AT&T July 11 *Ex Parte*).

ture is necessary."[931] To withhold a proposed network element from a competing provider, an incumbent LEC must demonstrate that the element is proprietary and that gaining access to that element is not necessary because the competing provider can use other, nonproprietary elements in the incumbent LEC's network to provide service.[932] U S West asserts that switch unbundling could raise concerns involving, among other things, "licensing of intellectual property." It cites a request by one interconnector to be the exclusive provider of particular features in U S West's generic switching software.[933] Bell Atlantic states that it is not at liberty to sub-license the software that operates vertical switching features.[934] We note, however, that these incumbent LECs do not object to providing vertical switching functionalities to requesting carriers under the resale provision of section 251(c)(4).[935] In addition, the vast majority of parties that discuss unbundled local switching do not raise proprietary concerns with the unbundling of either basic local switching or vertical switching features. Even if we accept the claim of U S West and Bell Atlantic that vertical features are proprietary in nature, these carriers do not meet the second consideration in our section 251(d)(2)(A) standard, which requires an incumbent LEC to show that a new entrant could offer the proposed telecommunications service through the use of other, nonproprietary elements in the incumbent LEC's network.[936] Accordingly, we find that access to unbundled local switching is clearly "necessary" under our interpretation of section 251(d)(2)(A).[937]

[937] *Id.*

420. Section 251(d)(2)(B) directs the Commission to consider whether the failure to provide access to an unbundled element "would impair the ability of the telecommunications carrier seeking access to provide the services that it seeks to offer." [938] We have interpreted the term "impair" to mean either increased cost or decreased service quality that would result from using network elements of the incumbent LEC other than the one sought.[939] SBC and MFS contend that access to unbundled local switching may not be essential for new entrants because competitors are likely to deploy their own switches.[940] These parties present no evidence that competitors could provide service using another element in the LEC's network at the same cost and at the same level of quality. In addition, most commenters that address this issue generally argue that local switching is essential for the provision of competing local service,[941] and we agree. We thus conclude that a requesting carrier's ability to offer local exchange services would be impaired, if not thwarted, without access to an unbundled local switching element.

421. Section 251(c)(3) requires that incumbent LECs provide access to unbundled network elements on terms and conditions that are "just, reasonable, and nondiscriminatory." [942] We agree with CompTel and LDDS that new entrants will be disadvantaged if customer switchover is not rapid and transparent. We also note that the Michigan Commission has recognized the significance of customer switchover intervals and has directed Ameritech and GTE to file proposals on how they will "ensure the

[942] 47 U.S.C. § 251(c)(3).

equal availability of expeditious processing of local, inter-LATA, and intraLATA carrier changes."[943] Therefore, we require incumbent LECs to switch over customers for local service in the same interval as LECs currently switch end users between interexchange carriers. This requirement applies to switchovers that only require the incumbent LEC to make changes to software. Switchovers that require the incumbent LEC to make physical modifications to its network, such as connecting a competitor's loop to its switch, are not subject to this requirement, and instead are governed by our terms and conditions for all unbundled elements.[944] Today, incumbent LECs routinely change customers' presubscribed interexchange carriers quickly and transparently, thereby contributing to the competitiveness of the interexchange market. We expect that a similar requirement for local exchange switchovers that require only a software change will similarly contribute to local exchange competition.

422. We reject the proposal by some incumbent LECs to define unbundled local switching as the facilities that provide a *point of access* to the switch, but that would not actually include switching functionality. Under this definition, the purchaser of the local switching element would not actually obtain local switching, only the right to purchase local switching functionality and other switching features at wholesale rates. We believe that the unbundled local switching element must include the functionality of connecting lines and trunks. The definition proposed by these incumbent LECs would contravene the requirement in section 251(c)(3) that incumbent LECs provide network elements "in a manner that allows requesting

---

[943] *In the Matter, On the Commission's Own Motion, To Establish Permanent Interconnection Arrangements Between Basic Local Exchange Service Providers*, Opinion and Order, Mich. Pub. Serv. Comm'n, Case No. U-10860, at 36-37 (June 5, 1996).

[944] *See supra* Section V.G., discussing provisioning intervals for unbundled network elements.

carriers to combine such elements in order to provide such telecommunications service." [945] If a competing provider combined its own loops and transport with the local switching element ("point of access"), it would be unable to provide telecommunications service without separately purchasing, at wholesale rates, switching functionality from the incumbent LEC.

423. We also disagree with the proposal to define local switching as a point of access plus basic switching functionality, but that would exclude vertical switching features.[946] As a legal matter, this definition is inconsistent with the 1996 Act's definition of "network element," which includes all the "features, functionalities, and capabilities provided by means of such facility or equipment." [947] In addition, this definition would not fulfill the pro-competitive objectives of the 1996 Act as effectively as the per-line definition we adopt. A competitor that obtains basic and vertical switching features at cost-based rates will have maximum flexibility to distinguish its offerings from those of the incumbent LEC by developing a variety of service packages and pricing plans.[948] Moreover, an upfront purchase of all local switching features may speed entry by simplifying practical issues such as the pricing of individual switching features.

424. We also address the impact on small incumbent LECs. For example, the Illinois Independent Telephone Association and the Rural Telephone Coalition favor rules that recognize the differences between larger and smaller LECs.[949] We have considered the economic impact of

[947] 47 U.S.C. § 153(29); *see supra* section V.C., which interprets the Act's definition of "network element."

[948] *See, e.g.*, LDDS comments at 33; AT&T comments at 21.

[949] Illinois Ind. Tel. Ass'n comments at 1; Rural Tel. Coalition reply at 37.

our rules in this section on small incumbent LECs. In this section, for example, we expressly provide for the fact that certain LECs may possess switches that are incapable of performing customized routing for competitors that purchase unbundled local switching. As noted by Rural Telephone Coalition and the Illinois Independent Telephone Coalition, this approach is necessary to accommodate the different technical capabilities of large and small carriers. We also note that section 251(f) of the 1996 Act provides relief for certain small LECs from our regulations under section 251.

(2) Tandem Switching Capability

425. We also affirm our tentative conclusion in the NPRM that it is technically feasible for incumbent LECs to provide access to their tandem switches unbundled from interoffice transmission facilities. We note that some states already have required incumbent LECs to unbundle tandem switching.[950] Parties do not contend, pursuant to section 251(d)(2)(A), that tandem switches are proprietary in nature. With regard to section 251(d)(2)(B), we find that competitors' ability to provide telecommunications service would be impaired without unbundled access to tandem switching. Therefore, we find that the availability of unbundled tandem switching will ensure that competitors can deploy their own interoffice facilities and connect them to incumbent LECs' tandem switches where it is efficient to do so.

* * * *

c. Discussion

439. We conclude that incumbent LECs must provide interoffice transmission facilities on an unbundled basis to requesting carriers. The record supports our conclusion

---

950 *See, e.g.*, Ameritech comments at 43, Cincinnati Bell comments at 18, GTE comments at 38, AT&T March 21 Letter at 23.

that such access is technically feasible and would promote competition in the local exchange market. We note that the 1996 Act requires BOCs to unbundle transport facilities prior to entering the in-region, interLATA market.[986]

* * * *

441. The ability of new entrants to purchase the interoffice facilities we have identified will increase the speed with which competitors enter the market. By unbundling various dedicated and shared interoffice facilities, a new entrant can purchase all interoffice facilities on an unbundled basis as part of a competing local network, or it can combine its own interoffice facilities with those of the incumbent LEC. The opportunity to purchase unbundled interoffice facilities will decrease the cost of entry compared to the much higher cost that would be incurred by an entrant that had to construct all of its own facilities. An efficient new entrant might not be able to compete if it were required to build interoffice facilities where it would be more efficient to use the incumbent LEC's facilities. We recognize that there are alternative suppliers of interoffice facilities in certain areas. We are convinced, however, that entry will be facilitated if competitors have greater, not fewer, options for procuring interoffice facilities as part of their local networks, and that Congress intended for competitors to have those options available from competitors. Thus, the rules we establish for the unbundled interoffice facilities should maximize a competitor's flexibility to use new technologies in combination with existing LEC facilities.

442. We find that it is technically feasible for incumbent LECs to unbundle the foregoing interoffice facilities as individual network elements. The interconnection and unbundling arrangements among the larger LECs, IXCs, and CAPs that resulted from our *Expanded Interconnec-*

---

986 47 U.S.C. § 271(c)(2)(B)(v).

tion rules confirm the technical feasibility of unbundling interoffice facilities used by incumbent LECs to provide special access and switched transport.[988] As AT&T and Telecommunications Resellers Association point out, IXCs currently interconnect with incumbent LECs' transport facilities pursuant to standard specifications.[989] We also note that commenters do not identify technical feasibility problems with unbundling interoffice facilities.

* * * *

482. Under section 251(d)(2)(B), the Commission must consider whether "the failure to provide access to such network elements would impair the ability of the telecommunications carrier seeking access to provide the services that it seeks to offer."[1122] Access to signaling systems continues to be a critical element to providing competing local exchange and exchange access service. The vast majority of calls made over incumbent LEC networks are set-up and controlled by separate signaling networks. Incumbent LECs argue that access to signaling systems and associated databases is already available from other providers and therefore, they should not have to unbundle them for access by competitors.[1123] As discussed above, section 251(d)(2)(B) only relieves an incumbent LEC of its unbundling obligation if other unbundled elements in its network could provide the same service without diminution of quality. Because alternative signaling methods, such as in-band signaling, would provide a lower quality of service,[1124] we conclude that a competitor's ability

---

[988] *See, e.g.*, MCI comments at 32; NCTA comments at 42; GST comments at 24; TIA comments at 13; MFS comments at 47-48.

[989] AT&T comments at 22; Telecommunications Resellers Ass'n comments at 35.

[1122] 47 U.S.C. § 251(d)(2)(B).

[1123] *See, e.g.*, Bell Atlantic comments at 27-28; BellSouth comments at 44; GTE comments at 40-41; NYNEX comments at 71.

[1124] SS7 network signaling is critical in the provision of modern telecommunications services, allowing signaling messages to travel

to provide service would be significantly impaired if it did not have access to incumbent LECs' unbundled signaling links and STPs.

483. The purchase of unbundled elements of the SS7 network gives the competitive provider the right to use those elements for signaling between its switches (including unbundled switching elements), between its switches and the incumbent LEC's switches, and between its switches and those third party networks with which the incumbent LEC's SS7 network is interconnected. When a competitive provider purchases unbundled switching from the incumbent LEC, the incumbent LEC must provide nondiscriminatory access to its SS7 network from that switch in the same manner in which it obtains such access itself. Carriers that provide their own switching facilities should be able to access the incumbent LEC's SS7 network for each of their switches via a signaling link between their switch and an incumbent LEC's STP.[1128] Competitive carriers should be able to make this connection in the same manner as an incumbent LEC connects one of its own switches to the STP. This could be accomplished by the incumbent providing an unbundled signal-

---

separately from the voice path for individual calls, increasing efficiency and making possible a host of new signaling-based services. AT&T comments at 23. Popular features like Calling Number Identification (Caller ID) and Calling Name Identification, as well as enhanced call set-up functions and such Custom Calling features as Repeat Call and Return Call, would be unavailable without SS7 capabilities. Bell Atlantic comments at Attachment 3, 17.

[1128] Competitors should be able to interconnect their own switches to the incumbent LEC's signaling system in any technically feasible manner. Competitors may bring a signaling "A" link from their switch to the incumbent LEC's STP. CAPs use this type of connection today to connect their tandem switches to incumbent LECs' STPs. AT&T comments at 24 n.26. Competitors might also link their switch to their own STP, and then connect to an incumbent LEC's STP via a signaling "D" or "B" link.

ing link from its STP to the competitor's switch or by a competitor bringing a signaling link from its switch to the incumbent LEC's STP.

(2) Call-Related Databases

484. We conclude that incumbent LECs, upon request, must provide nondiscriminatory access on an unbundled basis to their call-related databases[1126] for the purpose of switch query and database response through the SS7 network.[1127] Thus, for example, we find that it is technically feasible for incumbent LECs to provide access to the Line Information Database (LIDB), the Toll Free Calling Database and Number Portability downstream databases.[1128] The vast majority of parties, including incumbent LECs, agree that it is technically feasible to provide access to the LIDB and the Toll Free Calling databases at an STP

[1126] Call-related databases are those SS7 databases used for billing and collection or used in the transmission, routing, or other provision of a telecommunications service.

[1127] Query and response access to a call-related database is intended to require the incumbent LEC only to provide access to its call-related databases as is necessary to permit a competing provider's switch (including the use of unbundled switching) to access the call-related database functions supported by that database. The incumbent LEC may mediate or restrict access to that necessary for the competing provider to provide such services as are supported by the database.

[1128] AT&T indicates that for LIDB and 800/888 database queries standard TCAP messages have been established, and reliability, security, provisioning, and billing issues have been addressed. Letter from Karen Weis, Division Manager, AT&T to William Caton, Acting Secretary, FCC, July 16, 1996 (AT&T July 16 *Ex Parte*). Bell Atlantic states that it currently provides interconnection for LIDB and 800 databases. Bell Atlantic comments at 2. Number portability "downstream databases" are defined in Part 51 of our rules as adopted by this Order. *See In the Matter of Telephone Number Portability*, First Report and Order and Further Notice of Proposed Rulemaking, CC Docket No. 95-116, FCC 96-286 (rel. July 2, 1996).

linked to the database.[1129] Several state commissions also report that they have ordered incumbent LECs' to provide such access to the LIDB and the Toll Free Calling databases.[1130] We require incumbent LECs to provide this access to their call-related databases by means of physical access at the STP linked to the unbundled database. We find that such access is critical to entry in the local exchange market.

* * * *

486. Several commenters also identified access to call-related databases used in the incumbent's AIN to be critical to fair competition in the local market, [1133] and some state commissions have ordered incumbent LECs to provide access to AIN databases.[1134] We conclude that such access is technically feasible via an STP for those call-related databases used in the incumbent LEC's AIN.[1135] First, of course, when a new entrant purchases an incumbent's local switching element it is technically feasible for the new entrant to use the incumbent's SCP element in the same manner, and via the same signaling links, as the incumbent itself. Thus, we find no technical impediments in the record with regard to such access when a requesting

[1134] Louisiana Commission comments at 5; Wyoming Commission comments at 23-24; *see also Illinois Wholesale Order.*

[1135] AT&T comments at 23-26; CompTel comments at 43; MCI comments at 36; Letter from Wendy Blueming, Regulatory Affairs and Public Policy, SNET to William Caton, Acting Secretary, FCC, July 23, 1996 (SNET July 23 *Ex Parte*); AT&T July 16 *Ex Parte.*

carrier is also purchasing a local switching element associated with the AIN call-related database.

487. Further, we conclude that when a new entrant deploys its own switch, and links it to the incumbent LEC's signaling system, it is technically feasible for the incumbent to provide access to the incumbent's SCP to provide AIN-supported services to customers served by the new entrant's switch. Some SS7 network services resellers currently provide such access.[1136] Other potential local competitors present additional evidence supporting the technical feasibility of such access.[1137] Unlike the situation where a competitor's SCP would control the incumbent's switch (which is discussed below in section V.I.4.c.(4)), in this scenario, the incumbent's SCP will respond to and control the competitor's switch, and potential competitors that have commented in the record do not express network reliability concerns with regard to such control.[1138] Further, like the software resident in a switch, the incumbent LEC's applications resident in an SCP are merely part of the overall software and hardware making up the SCP facility. Thus, carriers purchasing access under either scenario above may use the incumbent's service applications in addition to their own.[1139]

488. Although we conclude that access to incumbent AIN SCPs is technically feasible, we agree with BellSouth

---

[1136] SNET July 23 *Ex Parte*; Letter from Stephen Kraskin, Illuminet (USTN) to Office of the Secretary, FCC July 23, 1996 (USTN July 23 *Ex Parte*).

[1137] *See* AT&T July 16 *Ex Parte; see also* AT&T comments at 23-26; CompTel comments at 43; MCI comments at 36.

[1138] *See* AT&T July 16 *Ex Parte*. AT&T asserts that no additional or unique reliability problems would be created that have not already been addressed and resolved by those incumbent LECs who have proposed SMS access for third parties in the Intelligent Networks proceeding. *Id.*

[1139] *See infra*, Section V.I.4.c.(3) on unbundled access to the incumbent LEC's SCE and SMS.

that such access may present the need for mediation mechanisms to, among other things, protect data in incumbent AIN SCPs and ensure against excessive traffic volumes.[1140] In addition, there may be mediation issues a competing carrier will need to address before requesting such access.[1141] Accordingly, if parties are unable to agree to appropriate mediation mechanisms through negotiations, we conclude that during arbitration of such issues the states (or the Commission acting pursuant to section 252(a)(5)) must consider whether such mediation mechanisms will be available and will adequately protect against intentional or unintentional misuse of the incumbent's AIN

[1140] Letter from W.W. Jordan, Executive Director—Federal Regulatory, BellSouth to William Caton, Acting Secretary, FCC, July 16, 1996 (BellSouth July 16 *Ex Parte*) ("With a BellSouth SCP to a ALEC SSP [switch] interconnection arrangement, network reliability and security concerns, from BellSouth's perspective, would largely be limited to issues associated with traffic management."); Letter from James Smith, Director—Federal Relations, Ameritech to William Caton, Acting Secretary, FCC, July 17, 1996 (Ameritech July 17 *Ex Parte*) ("The volume of queries sent from the CLEC SSP [switch] could overload the LEC SCP, interfering with the operation of the service provided to that CLEC, or with other services which may operate on the LEC's SCP."); Letter from Joseph Mulieri, Director—FCC Relations, Bell Atlantic to Robert S. Tanner, Attorney Advisor, FCC, July 18, 1996 (Bell Atlantic July 18 *Ex Parte*). BellSouth also raises the need for mediation to prevent unauthorized modification of information within an incumbent LEC's AIN SCP database. BellSouth July 16 *Ex Parte*. Incumbent LEC's comments in this proceeding and in the IN docket generally focus on the need for mediation to prevent a competitor's database from sending inappropriate AIN signaling information to the incumbent LEC's switch (*see infra* Section V.I.4.c.(4)). *See* PacTel comments at 61-62; BellSouth comments at 45-46; Bell Atlantic comments at Appendix 3, 18-19; U S West comments in CC Docket No. 91-346 at 73-74, 84; NYNEX comments in CC Docket No. 91-346 at 14-15; SBC comments in CC Docket No. 91-346 at 8-9.

[1141] Mediation may be necessary for requesting carriers to ensure that inadvertent feature interactions, network management control and customer privacy concerns do not arise from such access. *See e.g.*, Ameritech July 17 *Ex Parte*.

facilities. We encourage incumbent LECs and competitive carriers to participate in industry fora and industry testing to resolve outstanding mediation concerns.[1142] Incumbent LECs may establish reasonable certification and testing programs for carriers proposing to access AIN call related databases in a manner similar to those used for SS7 certification.[1143]

489. We recognize that providing unbundled access to AIN call-related databases at cost, and in particular providing access to the incumbent LEC's software applications that reside in the AIN databases, may reduce the incumbent's incentive to develop new and advanced services using AIN. In the near term, however, requiring entrants to bear the cost of deploying a fully redundant network architecture, including AIN databases and their application software, would constitute a significant barrier to market entry for competitive carriers. As local service markets develop, however, competition may reduce the incumbent LEC's control over bottleneck facilities and increase the importance of innovation. In those circumstances it is important that incumbent LECs have the incentive to develop unique and innovative services supported by AIN. Therefore at a later date, we will revisit the proper balance between providing unbundled access and maintaining the incentives of incumbent LECs to innovate.

490. Parties generally do not identify proprietary concerns when access to call-related databases is provided via STPs. In general, signaling protocols used to access call-related databases adhere to open Bellcore standards.

[1142] *See, e.g.*, Christine Maglott, *Information Industry Liaison Committee Wrestles with Mediation Issues*, ATIS News, 3 Vol. 11, No.3, May-June, 1996.

[1143] SBC notes that carriers proposing to gain access to its SS7 network and gather information from its SCP must be certified and enter into contractual agreements for information access and proper billing. SBC comments at 47-48.

Parties also do not raise proprietary concerns with specific call-related databases themselves. Today, many separate carriers access incumbent LEC Toll Free Calling and LIDB databases for the proper routing and billing of calls.[1144] Thus, we conclude that, in general, unbundled access to call-related databases does not present proprietary concerns with respect to section 251(d)(2)(A). Incumbent LECs may, however, present such proprietary concerns in the arbitration process with regard to specific databases, and states (or the Commission acting pursuant to section 252(e)(5)) may take action to limit unnecessary access to proprietary information.

491. We also conclude that denying access to call-related databases would impair the ability of a competing provider to offer services such as Alternative Billing Services and AIN-based services. AIN-based services represent the cutting edge of telephone exchange services, and competitors would be at a significant disadvantage if they were forced to develop their own AIN capability immediately. In addition, the record indicates that deployment of call-related databases in the near term would represent a substantial cost to new entrants. As mentioned above, incumbent LECs argue that access to certain call-related databases is already competitively available and therefore they should not have to unbundle access to them.[1145] As discussed above, however, section 251(d)(2)(B) would only relieve an incumbent LEC of its unbundling obligation if other unbundled elements in its network could provide the same service without diminution of quality. Because of the absence of such elements, we conclude that a competitor's ability to provide service would be significantly impaired if it did not have unbundled access to incumbent LECs' call-related databases, including the LIDB, Toll

---

[1144] *See* AT&T July 16 *Ex Parte*.

[1145] We note that competitive provision of AIN SCP database services is not evidenced in the record.

Free Calling, and AIN databases for the purpose of switch query and database response through the SS7 network.

492. We also conclude that access to call-related databases as discussed above, and access to the service management system discussed below, must be provided to, and obtained by, requesting carriers in a manner that complies with section 222 of the Act. Section 222, which was effective upon adoption, sets out requirements for privacy of customer information. Section 222(a) provides that all telecommunications carriers have a duty to protect the confidentiality of proprietary information of other carriers, including resellers, equipment manufacturers, and customers. Section 222(b) requires that telecommunications carriers that use proprietary information obtained from another telecommunications carrier in providing any telecommunications service "shall use that information only for such purpose, and shall not use such information for its own marketing purposes." [1146] Section 222(c) and (d) provide protection for, and limitations on the use of, and access to, customer proprietary network information (CPNI).[1147] We note that we have initiated a proceeding to clarify the obligations of carriers with regard to section 222(c) and (d).[1148]

(3) Service Management Systems

493. Finally, we conclude that incumbent LECs should provide access, on an unbundled basis, to the service man-

---

[1146] 47 U.S.C. § 222(b).

[1147] Section 222(f)(1) defines CPNI as "information that relates to the quantity, technical configuration, type, destination, and amount of use of a telecommunications service subscribed to by any customer of a telecommunications carrier, and that is made available to the carrier by the customer solely by virtue of the carrier-customer relationship." 47 U.S.C. § 222(f)(1)(A).

[1148] *See Implementation of the Telecommunications Act of 1996: Telecommunications Carriers' Use of Customer Proprietary Network Information and other Customer Information*, Notice of Proposed Rulemaking, CC Docket No. 96-115, FCC 96-221 (rel. May 17, 1996).

agement systems (SMS), which allow competitors to create, modify, or update information in call-related databases. We believe it is technically feasible for incumbent LECs to provide access to the SMS in the same manner and method that they provide for their own access. We find that such access is necessary for competitors to effectively use call-related databases, which we have already found to be critical to entry in the local exchange market.

494. Commenters argue that they need equal access to incumbent LECs' SMSs to write or populate their own information in call-related databases.[1149] As discussed above, information bound for many call-related databases is entered first at an off-line SMS, which then downloads the information to the call-related database for real time use on the network. We find that competing provider access to the SMS is technically feasible if it is provided in the same or equivalent manner that the incumbent LEC currently uses to provide such access to itself.[1150] For example, if the incumbent LEC inputs information into the SMS using magnetic tapes, the competitive carrier must be able to create and submit magnetic tapes for the incumbent to input into the SMS in the same way the incumbent inputs its own magnetic tapes. If the incumbent accesses the SMS through an electronic interface, the competitive carrier should be able to access the SMS through an equivalent electronic interface.[1151] We further conclude that, whatever method is used, the incumbent LEC must provide the competing carrier with the information necessary

---

[1149] AT&T comments at 26; MCI comments at 34-35.

[1150] Many carriers currently submit such information to incumbent LECs or third party SMSs. USTN reply at 1-4; Bell Atlantic comments at Attachment 3, 16; GTE comments at 40-41 n.61.

[1151] For example, access to the AIN SMS is accomplished through the SCE, which is a computer environment for the design and test of AIN based services.

to correctly enter or format for entry the information relevant for input into the particular incumbent LEC SMS.

495. Specifically with respect to AIN, we find that the record in the *Intelligent Networks* proceeding supports access to the SMS.[1152] A competing carrier seeking access to the SMS that is part of the incumbent LEC's AIN would do so through the incumbent LEC's service creation environment (SCE), an interface used to design, create, and test AIN supported services. Software successfully tested in the SCE is transferred to the SMS, where it is then downloaded into an SCP database for active deployment on the network. We are persuaded that the risk of harm to the public switched network from such access to the SMS is minimized by the technical safeguards inherent in the SCE and SMS. As described in comments filed in the *Intelligent Networks* docket, competitors accessing the SCE and SMS would not communicate directly with the LEC's database or switch.[1153] We therefore conclude that

---

[1152] *See Intelligent Networks*, Notice of Proposed Rulemaking, 8 FCC Rcd 6813 (1993). In the *Intelligent Networks* proceeding, most incumbent LECs supported SMS access. *See* GTE comments in CC Docket No. 91-346 at 21; United and Central comments in CC Docket No. 91-346 at 12; SNET comments in CC Docket No. 91-346 at 5; NYNEX comments in CC Docket No. 91-346 at 3 n.3, 10-11; BellSouth update comments in CC Docket No. 91-346 at 6; Bell Atlantic comments in CC Docket No. 91-346 at 6. Other parties, including potential competitors and manufacturers, also supported SMS access. *See* Siemens comments in CC Docket No. 91-346 at 2; TIA comments in CC Docket No. 91-346 at 2; MCI comments in CC Docket No. 91-346 at 10; Ericsson reply in CC Docket No. 91-346 at 2-3. Many commenters asserted that SMS access through the SCE would provide a valuable opportunity for third parties to create services. *See* GSA comments in CC Docket No. 91-346 at 3; SNET comments in CC Docket No. 91-346 at 2; Siemens comments in CC Docket No. 91-346 at 2; Ericsson reply in CC Docket No. 91-346 at 2-3; TIA comments in CC Docket No. 91-346 at 2; MCI comments in CC Docket No. 91-346 at 10.

[1153] In their comments, BellSouth and Bell Atlantic describe the way they provide or plan to provide access to the SMS for third

such access is technically feasible, and that incumbent LECs should provide requesting carriers with the same access to design, create, test, and deploy AIN-based services at the SMS that the incumbent LEC provides for itself.[1154] While many incumbent LECs express concerns with the technical feasibility of access to AIN, we conclude that those concerns deal primarily with the interconnection of third party AIN SCP databases to the incumbent LEC's AIN and not access to the SCE and SMS.[1155]

---

parties. Bell Atlantic proposes to first develop and deploy AIN services based on customer request and then subsequently to allow third parties themselves to create AIN services at a terminal either in a Bell Atlantic office or a third party office. Bell Atlantic comments in CC Docket No. 91-346 at 6. BellSouth proposes to permit third parties to use the service logic resident on BellSouth's service creation environment to create AIN services. BellSouth update reply in CC Docket No. 91-346 at 10.

[1154] Incumbent LECs that have deployed AIN must provide such access to competing carriers that will allow them to develop call processing applications pursuant to the same parameters the incumbent LEC uses itself, such as the time-of-day and origination of call parameters. BellSouth's recently proposed service to provide access to its SCE and SMS appears to be an example of the type of access to the SMS that incumbent LECs must provide to competitors upon request. *Pleading Cycle Established for Comments on BellSouth Telecommunications, Inc's Petition for Expedited Waiver of Part 69 Rules*, Public Notice, DA 96-27 (Jan. 17, 1996) (*BellSouth Part 69 Waiver Petition*).

[1155] Of the three potential points of access to AIN proposed in the *Intelligent Networks* NPRM, LEC commenters generally agree that SMS access poses the least risk of harm to the public switched telephone network. *See* Bell Atlantic comments in CC Docket No. 91-346 at 6-7; BellSouth comments in CC Docket No. 91-346 at 12, 13; GTE comments in CC Docket No. 91-346 at 19, 21; NYNEX comments in CC Docket No. 91-346 at 3; PacTel comments in CC Docket No. 91-346 at 20-21; SBC comments in CC Docket No. 91-346 at 5, 8; U S West comments in CC Docket No. 91-346 at 52; United and Central comments in CC Docket No. 91-346 at 1. Competitors also support such access. *See* MCI Comments at 6; Siemens Comments at 2; TIA Comments at 2.

496. We recognize that, although technically feasible, providing nondiscriminatory access to the SMS and SCE for the creation and deployment of AIN services may require some modifications, including appropriate mediation, to accommodate such access by requesting carriers. We note that Bell South is currently prepared to tariff and offer such access to third parties, and other incumbent LECs, including Bell Atlantic and Ameritech, indicate that they have made significant progress towards implementing such access.[1156] Therefore, if parties are unable to agree to appropriate mediation mechanisms through negotiations, we conclude that during arbitration of such issues the states (or the Commission acting pursuant to section 252(e)(5)) must consider whether such mediation mechanisms will be available and will adequately protect against intentional or unintentional misuses of the incumbent's AIN facilities. We again encourage incumbent LECs and competitive carriers to participate in industry fora and industry testing to resolve outstanding mediation concerns.

497. Parties did identify some proprietary concerns regarding access to the SCE and SMS used in the incumbent LEC's AIN. Some incumbent LECs contend that the interface used at the SCE is proprietary in nature.[1157] GVNW argues that specific AIN-based services designed

---

[1156] *BellSouth Part 69 Waiver Petition.* BellSouth proposes to tariff services that permit third parties to create and administer AIN services through access to the SCE and SMS. Bell South's SCE/SMS service will support third-party service development with the following AIN triggers: off-hook immediate, off-hook delay, public office dialing plan, customized dialing plan, feature code and terminating attempt triggers. *Id. See* Bell Atlantic comments in CC Docket No. 91-346 at 6, 8; Ameritech July 17 *Ex Parte.*

[1157] U S West comments at 58 n.124 (for example, BellSouth uses DESIGNedge for such access which utilizes a proprietary database technology tailored to its network); Bell Atlantic comments at 28-29.

by carriers should be proprietary in nature.[1158] Competitors correctly argue that AIN can be used, not only for telecommunication services traditionally supported by the switch, but as a means to deploy advanced services not otherwise possible.[1159] We find that competing providers without access to AIN would be at a significant disadvantage to incumbent LECs, because they could not necessarily offer the same services to the customer. This access will help competing providers without imposing costs on incumbent LECs because the entrants will pay the cost.[1160] We therefore conclude, under section 251(d)(2)(A), that access to AIN, including those elements that may be proprietary, is necessary for successful entry into the local service market.

498. Most parties generally did not identify proprietary concerns with access to those SMSs used other than for AIN. Some parties, however, argue that there are proprietary interfaces used to enter information into various databases.[1161] Competing carriers counter that competitive providers would not need to have direct access to the proprietary methods of data entry used by incumbent LECs, and as a result we conclude that the unbundled access to SMSs used for other than AIN does not present proprietary concerns with respect to section 251(d)(2)(A).[1162]

499. We also conclude that unbundled access to all SMSs is necessary for a competing provider to effectively use unbundled call-related databases. We find that the

[1162] AT&T comments at 26.

inability of competing carriers to use the SMS in the same manner that an incumbent LEC uses to input data itself would impair the ability of a competing carrier to effectively offer services to its customers using unbundled call-related databases. Commenters in the record point out that access to call-related databases alone would not allow the competing carrier to provide such services to its customers without access to an SMS.[1163] We also conclude that AIN-based services are important to a new entrant's ability to compete effectively for customers with the incumbent LEC, and in developing new business by introducing new AIN based services. Thus we conclude that a competitor's ability to provide service would be significantly impaired if it did not have unbundled access to an incumbent LEC's SMS, including access to the SMS(s) used to input data to the LIDB, Toll Free Calling, Number Portability and AIN call-related databases.

500. We reject the contention by several incumbent LECs that signaling and database access was meant by the 1996 Act to apply only to such access as is necessary for call routing and completion. Although the competitive checklist for BOC entry into in-region interLATA services under section 271 requires "nondiscriminatory access to databases and associated signaling necessary for call routing and completion"[1164] the definition of a network element is more comprehensive in scope. A network element as defined by the 1996 Act includes "databases" and in particular "databases sufficient for billing and collection or used in the transmission, routing, or *other* provision of a telecommunications service."[1165] We find that the inclusion of "other provision of a telecommunications service" meant Congress intended the unbundling of databases to be read broadly and could include databases beyond

those directly used in the transmission or routing of a telecommunications service.

* * * *

506. In contrast, most incumbent LECs argue that operations support systems do not qualify as network elements under the 1996 Act.[1182] Ameritech argues that competitors have not demonstrated that they need access to such systems in order to provide telecommunications services.[1183] Several incumbent LECs assert that an incumbent LEC may negotiate with a competitor to provide such support services, but that the 1996 Act does not require them to unbundle these systems as network elements.[1184] Other parties argue that such access is not currently technically feasible and should be resolved through the negotiations process.[1185] SBC contends that its provisioning processes are neutral with respect to competing providers of service and that provisioning for competitors

510. Since the passage of the 1996 Act, several states have proceeded to implement rules for local competition, several of which include provisions concerning electronic interfaces.[1204] The Georgia Commission ordered BellSouth to establish electronic operational interfaces by July 15, 1996, and ordered both incumbent BellSouth and requesting carrier AT&T to submit a joint report to the commission within thirty days concerning the implementation schedule necessary to deploy such interfaces.[1205] After a motion for reconsideration, the Georgia Commission provided BellSouth with an additional month to establish these interfaces and added additional deadlines for the deployment and operation of such interfaces.[1206] The Illinois Commission ordered Ameritech and Centel to provide competitors with "all operational interfaces at

[1206] Motion for Reconsideration in Docket No. 6352-U (Georgia Commission July 2, 1996). The Georgia Commission directed that most electronic interfaces must be fully operational by the end of 1996, and established March 31, 1997 as an absolute deadline. *Id.*

parity with those provided their own retail customers." [1207] The Louisiana Commission has proposed rules on local competition that require incumbent LECs to deploy systems for competitors that are equivalent to those used by incumbents for their own retail exchange services.[1208] Under those rules, such access must be equal to that provided to an incumbent LECs' own personnel.[1209] The California Commission adopted interim rules ordering incumbent LECs to deploy automated on-line systems for access by competitors.[1210] The Indiana Commission concluded that a competitor's ability to utilize "electronic access, technical interfaces, or access to databases to place service orders, receive phone number assignments, receive information necessary to bill [its] customers and to inform the incumbent LEC of cases of trouble" is essential to the development of resale competition.[1211] Indiana

ordered incumbent LECs to provide all operational interfaces at parity with those the incumbent provides to its own retail customers.[1212] The Ohio Commission's rules on local competition require all LECs to provide "nondiscriminatory, automated operational support systems" that support access by competing carriers to such functions as pre-ordering, ordering, provisioning, repair and maintenance, number assignment, and billing.[1213] The Oklahoma Commission has proposed rules that require an incumbent LEC, to the extent it provides itself, its affiliates or subsidiaries, automated interfaces for the purpose of service ordering, maintenance or repair, to make such interfaces available to competitors.[1214]

* * * *

c. Discussion

516. We conclude that operations support systems and the information they contain fall squarely within the definition of "network element" and must be unbundled upon request under section 251(c)(3), as discussed below. Congress included in the definition of "network element" the terms "databases" and "information sufficient for billing and collection or used in the transmission, routing, *or*

1212 *Id.* at 49. The Commission also ordered incumbents Ameritech and GTE, to the extent they contend that they are unable to fully and immediately implement operational parity, to submit a comprehensive plan with specific timetables for achieving compliance. *Id.*

1214 All Sources Proposed Rules, Docket No. RM950000019 (Local Telephone Competition) (Oklahoma Commission March 7, 1996). Oklahoma rules clarify that such interfaces should not permit competitors to directly access the incumbent's underlying systems. *Id.* at 79.

other provision of a telecommunications service."[1253] We believe that the inclusion of these terms in the definition of "network element" is a recognition that the massive operations support systems employed by incumbent LECs, and the information such systems maintain and update to administer telecommunications networks and services, represent a significant potential barrier to entry. It is these systems that determine, in large part, the speed and efficiency with which incumbent LECs can market, order, provision, and maintain telecommunications services and facilities. Thus, we agree with Ameritech that "[o]perational interfaces are essential to promote viable competitive entry."[1254]

517. Nondiscriminatory access to operations support systems functions can be viewed in at least three ways. First, operations support systems themselves can be characterized as "databases" or "facilit[ies] . . . used in the provision of a telecommunications service," and the functions performed by such systems can be characterized as "features, functions, and capabilities that are provided by means of such facilit[ies]."[1255] Second, the information contained in, and processed by operations support systems can be classified as "information sufficient for billing and collection or used in the transmission, routing, or other provision of a telecommunications service."[1256] Third, nondiscriminatory access to the functions of operations support systems, which would include access to the information they contain, could be viewed as a "term or condition" of unbundling other network elements under section 251(c)(3), or resale under section 251(c)(4). Thus, we conclude that, under any of these interpretations, operations support systems functions are subject to the

---

[1253] 47 U.S.C. § 153(29) (emphasis added).

[1254] Ameritech July 10 *Ex Parte* at 5.

[1255] 47 U.S.C. § 153(29).

[1256] *Id.*

nondiscriminatory access duty imposed by section 251 (c)(3), and the duty imposed by section 251(c)(4) to provide resale services under just, reasonable, and nondiscriminatory terms and conditions.

518. Much of the information maintained by these systems is critical to the ability of other carriers to compete with incumbent LECs using unbundled network elements or resold services. Without access to review, *inter alia*, available telephone numbers, service interval information, and maintenance histories, competing carriers would operate at a significant disadvantage with respect to the incumbent. Other information, such as the facilities and services assigned to a particular customer, is necessary to a competing carrier's ability to provision and offer competing services to incumbent LEC customers.[1257] Finally, if competing carriers are unable to perform the functions of pre-ordering, ordering, provisioning, maintenance and repair, and billing for network elements and resale services in substantially the same time and manner that an incumbent can for itself, competing carriers will be severely disadvantaged, if not precluded altogether, from fairly competing. Thus providing nondiscriminatory access to these support systems functions, which would include access to the information such systems contain, is vital to creating opportunities for meaningful competition.

519. As noted in the comments above, several state commissions have ordered real-time access or have ongoing proceedings working to develop and implement it within their jurisdictions. The New York Commission, building on its pioneering experience with the Rochester Telephone "Open Market Plan," has facilitated a working group on electronic interfaces comprised of both in-

---

[1257] For these reasons, it is most important that incumbent LECs, which currently own the overwhelming majority of local facilities in any market, provide this information to those new entrants who initially will rely to varying degrees on incumbent LEC facilities. *See e.g.*, AT&T comments at 33-34.

cumbent LECs and potential competitors.[1258] The New York Commission focused on these issues in response to the frustrations and concerns of resellers in the Rochester market.[1259] In particular, AT&T alleged that it was "severely disadvantaged due to the fact that [Rochester Telephone] has failed to provide procedures for resellers to access [their] databases for on-line queries needed to perform basic service functions [such] as scheduling customer appointments."[1260] The New York Commission has concluded that wherever possible NYNEX will provide new entrants with real-time electronic access to its systems.[1261] As another example, the Georgia Commission recently ordered BellSouth to provide electronic interfaces such that resellers have the same access to operations support systems and informational databases as BellSouth does, including interfaces for pre-ordering, ordering and provisioning, service trouble reporting, and customer daily usage.[1262] In testimony before the Georgia Commission, a BellSouth witness acknowledged that "[n]o one is happy,

believe me, with a system that is not fully electronic." [1263] As noted above, Georgia ordered BellSouth to establish these interfaces within two months of its order (by July 15, 1996), but recently extended the deadline an additional month (to August 15th).[1264] Both the Illinois and Indiana Commissions ordered incumbent LECs immediately to provide to competitors access to operational interfaces at parity with those provided to their own retail customers, or submit plans with specific timetables for achieving such access.[1265] Several other states have passed laws or adopted rules ordering incumbent LECs to provide interfaces for access equal to that the incumbent provides itself.[1266] We recognize the lead taken by these states and others, and we generally rely upon their conclusions in this Order.

520. We conclude that providing nondiscriminatory access to operations support systems functions is technically feasible. Incumbent LECs today provide IXCs with different types of electronic ordering or trouble interfaces that demonstrate the feasibility of such access, and perhaps also provide a basis for adapting such interfaces for

[1265] In the Matter of the Investigation on the Commission's Own Motion into Any and All Matters Relating to Local Telephone Exchange Competition Within the State of Indiana, Cause No. 39983, Interim Order on Bundled Resale and Other Issues (Indiana Commissions July 1, 1996); *Illinois Wholesale Order.*

[1266] *See e.g.*, Texas Commission comments at 19; In the Matter of the Commission Investigation Relative to the Establishment of Local Exchange Competition and Other Competitive Issues, Case No. 95-845-TP-COI (Ohio Commission June 12, 1996); Order Instituting Rulemaking on the Commission's Own Motion into Competition for Local Exchange Service, R. 95-04-043 and I. 95-04-044 (California Commission April 26, 1995).

use between local service providers.[1267] Further, as discussed above, several incumbent LECs, including NYNEX and Bell Atlantic, are already testing and operating interfaces that support limited functions, and are developing the interfaces to support access to the remaining functions identified by most potential competitors.[1268] Some incumbent LECs acknowledge that nondiscriminatory access to operations support systems functions is technically feasible.[1269] Finally, several industry groups are actively establishing standards for inter-telecommunications company transactions.[1270]

521. Section 251(d)(2)(A) requires the Commission to consider whether "access to such network elements as are proprietary in nature is necessary."[1271] Incumbent LECs argue that there are proprietary interfaces used to access these databases and information. Parties seeking to compete with incumbent LECs counter that access to such databases and information is vitally important to the ability to broadly compete with the incumbent. As discussed above, competitors also argue that such access is necessary to order, provision, and maintain unbundled network elements and resold services, and to market competing services effectively to an incumbent LEC's customers. We find that it is absolutely necessary for competitive carriers to have access to operations support systems functions in order to successfully enter the local service market.

[1267] *See, e.g.*, Bell Atlantic June 21 *Ex Parte*; NYNEX July 12 *Ex Parte*; NYNEX July 17 *Ex Parte*; U S West June 28 *Ex Parte*; U S West July 9 *Ex Parte*.

[1271] 47 U.S.C. § 251(d)(2)(A).

522. Section 251(d)(2)(B) requires the Commission to consider whether "the failure to provide access to such network elements would impair the ability of the telecommunications carrier seeking access to provide the services that it seeks to offer."[1272] As mentioned above, parties identified access to operations support systems functions as critical to the provision of local service. We find that such operations support systems functions are essential to the ability of competitors to provide services in a fully competitive local service market. Therefore, we conclude that competitors' ability to provide service successfully would be significantly impaired if they did not have access to incumbent LEC's operations support systems functions.

523. We thus conclude that an incumbent LEC must provide nondiscriminatory access to their operations support systems functions for pre-ordering, ordering, provisioning, maintenance and repair, and billing available to the LEC itself.[1273] Such nondiscriminatory access necessarily includes access to the functionality of any internal gateway systems[1274] the incumbent employs in performing the above functions for its own customers. For example, to the extent that customer service representatives of the incumbent have access to available telephone numbers or service interval information during customer contacts, the incumbent must provide the same access to competing

---

[1272] 47 U.S.C. § 251(d)(2)(B).

[1273] We adopt the definition of these terms as set forth in the *AT&T-Bell Atlantic Joint Ex Parte* as the minimum necessary for our requirements. We note, however, that individual incumbent LEC's operations support systems may not clearly mirror these definitions. Nevertheless, incumbent LECs must provide nondiscriminatory access to the full range of functions within pre-ordering, ordering, provisioning, maintenance and repair and billing enjoyed by the incumbent LEC.

[1274] A gateway system refers to any electronic interface the incumbent LEC has created for its own use in accessing support systems for providing pre-ordering, ordering, provisioning, repair and maintenance, and billing.

providers. Obviously, an incumbent that provisions network resources electronically does not discharge its obligation under section 251(c)(3) by offering competing providers access that involves human intervention, such as facsimile-based ordering.[1275]

524. We recognize that, although technically feasible, providing nondiscriminatory access to operations support systems functions may require some modifications to existing systems necessary to accommodate such access by competing providers.[1276] Although, as discussed above, many incumbent LECs are actively developing these systems, even the largest and most advanced incumbent LECs have not completed interfaces that provide such access to all of their support systems functions. State commissions such as Georgia, Illinois, and Indiana, however, have ordered that such access be made available to requesting carriers in the near term. As a practical matter, the interfaces developed by incumbents to accommodate nondiscriminatory access will likely provide such access for services and elements beyond a particular state's boundaries, and thus we believe that requirements for such access by a small number of states representing a cross-section of the country will quickly lead to incumbents providing access in all regions.

525. In all cases, however, we conclude that in order to comply fully with section 251(c)(3) an incumbent LEC must provide, upon request, nondiscriminatory access to operations support systems functions for preordering, provisioning, maintenance and repair, and billing of unbundled network elements under section 251

[1275] Such access was all that Rochester Telephone provided to AT&T, when AT&T attempted to compete as a reseller of Rochester Telephone service. *See* Letter from Bruce Cox, Government Affairs Director, AT&T to William Caton, Acting Secretary, FCC, July 10, 1996 (AT&T July 10 *Ex Parte*).

[1276] *See supra*, Section V.G. regarding accommodation of unbundling.

(c)(3) and resold services under section 251(c)(4). Incumbent LECs that currently do not comply with this requirement of section 251(c)(3) must do so as expeditiously as possible, but in any event no later than January 1, 1997.[1277] We believe that the record demonstrates that incumbent LECs and several national standards-setting organizations have made significant progress in developing such access. This progress is also reflected in a number of states requiring competitor access to these transactional functions in the near term. Thus, we believe that it is reasonable to expect that by January 1, 1997, new entrants will be able to compete for end user customers by obtaining nondiscriminatory access to operations support systems functions.

526. We have considered the economic impact of our rules in this section on small incumbent LECs. For example, RTC urges us to recognize the differences between carriers in regards to computerized network administration and operational interfaces. Our requirement of nondiscriminatory access to operations support systems recognizes that different incumbent LECs possess different existing systems. We also note, however, that sections 251(f) of the 1996 Act provides relief for certain small LECs from our regulations implementing section 251.

527. Ideally, each incumbent LEC would provide access to support systems through a nationally standardized gateway. Such national standards would eliminate the need for new entrants to develop multiple interface systems, one for each incumbent. We believe that the progress made by standards-setting organizations to date evidences a strong national movement toward such a uniform standard.[1278] For example, both AT&T and Bell Atlantic agree that, given appropriate guidance from the Commis-

---

[1277] *See infra*, Section VII.B. for a discussion of exemptions and suspensions for small and rural incumbent LECs.

[1278] *See* Sprint June 25 *Ex Parte*; AT&T comments at 38; BellSouth reply at 27.

sion, the industry can achieve consensus on national standards such that within 12 months 95% of all inter-telecommunications company transactions may be processed via nationally standardized electronic gateways.[1279]

528. In order to ensure continued progress in establishing national standards, we propose to monitor closely the progress of industry organizations as they implement the rules adopted in this proceeding. Depending upon the progress made, we will make a determination in the near future as to whether our obligations under the 1996 Act require us to issue a separate notice of proposed rulemaking or take other action to guide industry efforts at arriving at appropriate national standards for access to operations support systems.

* * * *

c. Discussion

(1) Operator Services and Directory Assistance

534. We conclude that incumbent LECs are under the same duty to permit competing carriers nondiscriminatory access to operator services and directory assistance facilities as all LECs are under section 251(b)(3).[1300] We further conclude that, if a carrier requests an incumbent LEC to unbundle the facilities and functionalities providing operator services and directory assistance as separate network elements, the incumbent LEC must provide the competing provider with nondiscriminatory access to such facilities and functionalities at any technically feasible point. We believe that these facilities and functionalities are important to facilitate competition in the local exchange market. Further, the 1996 Act imposes upon BOCs, as a condition of entry into in-region interLATA services the duty to provide nondiscriminatory access to

---

[1279] *AT&T-Bell Atlantic Joint Ex Parte.*

[1300] *See Dialing Parity Order supra,* Section I.

directory assistance services and operator call completion services.[1301] We therefore conclude that unbundling facilities and functionalities providing operator services and directory assistance is consistent with the intent of Congress.

535. As discussed in our section on nondiscriminatory access under section 251(b)(3),[1302] the provision of nondiscriminatory access to operator services and directory assistance must conform to the requirements of section 222, which restricts carrier's use of CPNI.[1303] In particular, access to directory assistance and underlying directory information does not require incumbent LECs to provide access to unlisted or unpublished telephone numbers, or other information that the incumbent LEC's customer has requested the LEC not to make available. In conforming to section 222, we anticipate that incumbent LECs will provide such access in a manner that will protect against the inadvertent release of unlisted customer names and numbers.

536. We note that several competitors advocate unbundling the facilities and functionalities providing operator services and directory assistance from particular resold services or the unbundled local switching element, so that a competing provider can provide these services to its customers supported by its own systems rather than those of the incumbent LEC.[1304] Some incumbent LECs argue that

---

[1301] 47 U.S.C. § 271(c)(2)(B)(vii)(II)-(III).

[1302] *See Dialing Parity Order supra*, Section I.

[1303] *See Implementation of the Telecommunications Act of 1996: Telecommunications Carriers' Use of Customer Proprietary Network Information and other Customer Information*, CC Docket No. 96-115, Notice of Proposed Rulemaking, FCC 96-221 (rel. May 17, 1996).

[1304] *See, e.g.*, AT&T comments at 26; Cable & Wireless comments at 20; Colorado Commission comments at 24; DOJ comments at 21; Frontier comments at 17 n.32; MCI comments at 18-20; Jones Intercable reply at 30.

such unbundling, however, is not technically feasible because of their inability to route individual end user calls to multiple systems.[1305] We find that unbundling both the facilities and functionalities providing operator services and directory assistance as separate network elements will be beneficial to competition and will aid the ability of competing providers to differentiate their service from the incumbent LECs. We also note that the Illinois Commission has recently ordered such access.[1306] We therefore find that incumbent LECs must unbundle the facilities and functionalities providing operator services and directory assistance from resold services and other unbundled network elements to the extent technically feasible. As discussed above in our section on unbundled switching, we require incumbent LECs, to the extent technically feasible, to provide customized routing, which would include such routing to a competitor's operator services or directory assistance platform.[1307]

537. We also note that some competitors seek access to operator services and directory assistance in order to serve their own customers.[1308] Some of these parties argue that nondiscriminatory access to such network elements requires incumbent LECs to provide rebranded operator call completion services and directory assistance to the competing carrier's customers.[1309] Incumbent LECs argue that the provision of these services on an unbranded or rebranded basis is not technically feasible because of their inability at the operator services or directory assistance platforms to identify the carrier serving the end user.[1310] As we concluded in our discussion on section 251(b)(3),

[1310] SBC reply at 22-23.

we find that incumbent LECs must permit nondiscriminatory access to both operator services and directory assistance in the same manner required of all LECs.[1311] We make no finding on the technical feasibility of providing branded or unbranded service to competitors based on the record before us. We note, however, that the Illinois Commission has ordered incumbent LECs to provide rebranded operator call completion services and directory assistance to requesting competitive carriers.[1312]

538. As discussed above, incumbent LECs must provide access to databases as unbundled network elements.[1313] We find that the databases used in the provision of both operator call completion services and directory assistance must be unbundled by incumbent LECs upon a request for access by a competing provider. In particular, the directory assistance database must be unbundled for access by requesting carriers.[1314] Such access must include both entry of the requesting carrier's customer information into the database, and the ability to read such a database, so as to enable requesting carriers to provide operator services and directory assistance concerning incumbent LEC customer information. We clarify, however, that the entry of a competitor's customer information into an incumbent LEC's directory assistance database can be mediated by the incumbent LEC to prevent unauthorized use of the database. We find that the arrangement ordered by the California Commission concerning the shared use of such a database by Pacific Bell and GTE is one possible method of providing such access.[1315]

[1311] *See Dialing Parity Order supra*, Section I.

[1312] *See Illinois Wholesale Order.*

[1313] *See supra*, Section V.J.

[1314] We find the joint directory assistance database used by Pacific Bell and GTE to be one method of such access. MCI comments at 38.

[1315] *See Re GTE California Incorporated*, 31 CPUC 2d 370 (1989).

539. Section 251(d)(2)(A) requires the Commission to consider whether "access to such network elements as are proprietary in nature is necessary." [1316] Parties generally did not identify proprietary concerns with unbundling access to operator call completion services or directory assistance. Incumbent LECs generally did not claim a proprietary interest in their directory assistance databases. Many parties contend that proprietary interests leading to restrictions on use or sharing of such database information would injure their ability to compete effectively for local service.[1317] For the reasons described below, we find that access to the systems supporting both operator call completion services and directory assistance is necessary for new entrants to provide competing local exchange service.

540. Section 251(d)(2)(B) requires the Commission to consider whether "the failure to provide access to such network elements would impair the ability of the telecommunications carrier seeking access to provide the services that it seeks to offer." [1318] Parties identified access to operator call completion services and directory assistance as critical to the provision of local service.[1319] Therefore we conclude that competitors' ability to provide service would be significantly impaired if they did not have access to incumbent LECs' operator call completion services and directory assistance.

* * * *

554. Finally, in accordance with our interpretation of the term "technically feasible," we conclude that, if a particular method of interconnection is currently employed between two networks, or has been used successfully in the past, a rebuttable presumption is created that such a

[1319] MCI comments at 37-38.

method is technically feasible for substantially similar network architectures. Moreover, because the obligation of incumbent LECs to provide interconnection or access to unbundled elements by any technically feasible means arises from sections 251(c)(2) and 251(c)(3), we conclude that incumbent LECs bear the burden of demonstrating the technical infeasibility of a particular method of interconnection or access at any individual point.

* * * *

(3). Discussion

585. We believe that incumbent LECs have the incentive and capability to impede competitive entry by minimizing the amount of space that is available for collocation by competitors. Accordingly, we adopt our *Expanded Interconnection* space allocation rules for purposes of section 251, except as indicated herein. LECs will thus be required to make space available to requesting carriers on a first-come, first-served basis. We also conclude that collocators seeking to expand their collocated space should be allowed to use contiguous space where available. We further conclude that LECs should not be required to lease or construct additional space to provide physical collocation to interconnectors when existing space has been exhausted. We find such a requirement unnecessary because section 251(c)(6) allows incumbent LECs to provide virtual collocation where physical collocation is not practical for technical reasons or because of space limitations. Consistent with the requirements and findings of the *Expanded Interconnection* proceeding, we conclude that incumbent LECs should be required to take collocator demand into account when renovating existing facilities and constructing or leasing new facilities, just as they consider demand for other services when undertaking such projects. We find that this requirement is necessary in order to ensure that sufficient collocation space will be available in the future. We decline, however, to adopt a general rule requiring LECs to file reports on the status and planned

increase and use of space. State commissions will determine whether sufficient space is available for physical collocation, and we conclude that they have authority under the 1996 Act to require incumbent LECs to file such reports. We expect individual state commissions to determine whether the filing of such reports is warranted.

* * * *

VII. PRICING OF INTERCONNECTION AND UNBUNDLED ELEMENTS

A. Overview

618. The prices of interconnection and unbundled elements, along with prices of resale and transport and termination, are critical terms and conditions of any interconnection agreement. If carriers can agree on such prices voluntarily without government intervention, these agreements will be submitted directly to the states for approval under section 252. To the extent that the carriers, in voluntary negotiations, cannot determine the prices, state commissions will have to set those prices. The price levels set by state commissions will determine whether the 1996 Act is implemented in a manner that is *pro-competitor* and favors one party (whether favoring incumbents or entrants) or, as we believe Congress intended, *pro-competition*. As discussed more fully in Section II.D. above, it is therefore critical to implementing Congress's pro-competitive, de-regulatory national policy framework to establish among the states a common, pro-competition understanding of the pricing standards for interconnection and unbundled elements, resale, and transport and termination. While such a common interpretation might eventually emerge through judicial review of state arbitration decisions, we believe that such a process could delay competition for years and require carriers to incur substantial legal costs.[1490] We therefore conclude that, to ex-

[1490] For a discussion of our legal authority to adopt national pricing rules, *see supra*, Section II.D.

pedite the development of fair and efficient competition, we must set forth rules now establishing this common, pro-competition understanding of the 1996 Act's pricing standards. Accordingly, the rules we adopt today set forth the methodological principles for states to use in setting prices. This section addresses interconnection and unbundled elements, and subsequent sections address resale and transport and termination, respectively.

619. While every state should, to the maximum extent feasible, immediately apply the pricing methodology for interconnection and unbundled elements that we set forth below, we recognize that not every state will have the resources to implement this pricing methodology immediately in the arbitrations that will need to be decided this fall. Therefore, so that competition is not impaired in the interim, we establish default proxies that a state commission shall use to resolve arbitrations in the period before it applies the pricing methodology. In most cases, these default proxies for unbundled elements and interconnection are ceilings, and states may select lower prices. In one instance, the default proxy we establish is a price range. Once a state sets prices according to an economic cost study conducted pursuant to the cost-based pricing methodology we outline, the defaults cease to apply. In setting a rate pursuant to the cost-based pricing methodology, and especially when setting a rate above a default proxy ceiling or outside the default proxy range, the state must give full and fair effect to the economic costing methodology we set forth in this Order and must create a factual record, including the cost study, sufficient for purposes of review after notice and opportunity for the affected parties to participate.

620. In the following sections, we first set forth generally, based on the current record, a cost-based pricing methodology based on forward-looking economic costs, which we conclude is the approach for setting prices that best furthers the goals of the 1996 Act. In dynamic competitive markets, firms take action based not on embedded

costs, but on the relationship between market-determined prices and forward-looking economic costs. If market prices exceed forward-looking economic costs, new competitors will enter the market. If their forward-looking economic costs exceed market prices, new competitors will not enter the market and existing competitors may decide to leave. Prices for unbundled elements under section 251 must be based on cost under the law, and that should be read as requiring that prices be based on forward-looking economic costs. New entrants should make their decisions whether to purchase unbundled elements or to build their own facilities based on the relative economic costs of these options. By contrast, because the cost of building an element is based on forward-looking economic costs, new entrants' investment decisions would be distorted if the price of unbundled elements were based on embedded costs. In arbitrations of interconnection arrangements, or in rulemakings the results of which will be applied in arbitrations, states must set prices for interconnection and unbundled network elements based on the forward-looking, long-run, incremental cost methodology we describe below. Using this methodology, states may not set prices lower than the forward-looking increment costs directly attributable to provision of a given element. They may set prices to permit recovery of a reasonable share of forward-looking joint and common costs of network elements.[1491] In the aftermath of the arbitrations and relying on the state experience, we will continue to review this costing methodology, and issue additional guidance as necessary.

621. We reject various arguments raised by parties regarding the recovery of costs other than forward-looking economic costs in section 251(c)(2) and (c)(3) prices,

---

[1491] We define these and other forward-looking cost concepts *infra*, Section VII.B.2.a. We define what we consider to be a reasonable share of forward-looking joint and common costs *infra*, Section VII.B.2.a.

including the possible recovery of: (1) embedded or accounting costs in excess of economic costs; (2) incumbent LECs' opportunity costs; (3) universal service subsidies; and (4) access charges. As discussed in Section VII.B.2.a. below, certain portions of access charges may continue to be collected for an interim period in addition to section 251(c)(3) prices.

622. With respect to prices developed under the forward-looking, cost-based pricing methodology, we conclude that incumbent LECs' rates for interconnection and unbundled elements must recover costs in a manner that reflects the way they are incurred. We adopt certain rules that states must follow in setting rates in arbitrations. These rules are designed to ensure the efficient cost-based rates required by the 1996 Act.

623. In the next section of the Order, we establish default proxies that states may elect to use prior to utilizing an economic study and developing prices using the cost-based pricing methodology. We recognize that certain states may find it difficult to apply an economic costing methodology within the statutory time frame for arbitrating interconnection disputes. We therefore set forth default proxies that will be relatively easy to apply on an interim basis to interconnection arrangements. We discuss with respect to particular unbundled elements the reasonable rate structure for those elements and the particular default proxies we are establishing for use pending our adoption of a generic forward-looking cost model. Finally, we discuss the following additional matters: generic forward-looking costing models that we intend to examine further by the first quarter of 1997 in order to determine whether any of those models, with modifications, could serve as better default proxies; the future adjustment of rates; the relationship of unbundled element prices to retail prices; and the meaning of the statutory prohibition against discrimination in sections 251 and 252.

624. Those states that have already established methodologies for setting interconnection and unbundled rates must review those methodologies against the rules we are adopting in this Order. To the extent a state's methodology is consistent with the approach we set forth herein, the state may apply that methodology in any section 252 arbitration. However, if a state's methodology is not consistent with the rules we adopt today, the state must modify its approach. We invite any state uncertain about whether its approach complies with this Order to seek a declaratory ruling from the Commission.

B. Cost-Based Pricing Methodology

625. As discussed more fully in Section II.D. above, although the states have the crucial role of setting specific rates in arbitrations, the Commission must establish a set of national pricing principles in order to implement Congress's national policy framework. For the reasons set forth in the preceding section and as more fully explained below, we are adopting a cost-based methodology for states to follow in setting interconnection and unbundled element rates. In setting forth the cost-based pricing methodology for interconnection and access to unbundled elements, there are three basic sets of questions that must be addressed. First, does the 1996 Act require that the same standard apply to the pricing of interconnection provided pursuant to section 251(c)(2), and unbundled elements provided pursuant to section 251(c)(3)? Second, what is the appropriate methodology for establishing the price levels for interconnection and for each unbundled element, how should costs be defined, and is the price based on economic costs, embedded costs, or other costs? Third, what are the appropriate rate structures to be used to set prices designed to recover costs, including a reasonable profit? We address each of these questions in the following sections.

* * * *

664. In contrast, several incumbent LECs and state public utility commissions maintain that incumbent LECs should be permitted to recover their embedded costs in the rates set for interconnection, collocation, and unbundled network elements. These commenters claim that rates based on incremental costs alone fail to account for certain costs historically incurred to accomplish carrier-of-last-resort and universal service social policy objectives.[1655] The Attorneys General caution the Commission not to classify legitimate contributions to joint and common costs as impermissible implicit universal service subsidies.[1656]

* * * *

(3) Discussion

672. *Overview.* Having concluded in Section II.D., above, that we have the requisite legal authority and that we should establish national pricing rules, we conclude here that prices for interconnection and unbundled elements pursuant to sections 251(c)(2), 251(c)(3), and 252(d)(1), should be set at forward-looking long-run economic cost. In practice, this will mean that prices are based on the TSLRIC of the network element, which we will call Total Element Long Run Incremental Cost (TELRIC), and will include a reasonable allocation of forward-looking joint and common costs. The 1996 Act encourages competition by removing barriers to entry and providing an opportunity for potential new entrants to purchase unbundled incumbent LEC network elements to compete efficiently to provide local exchange services. We

---

1655 *See, e.g.*, Alabama Commission comments at 24-25; Bay Springs, *et al.* comments at 16; BellSouth comments at 57; Matanuska Tel. comments at 2-3; TDS comments at 20; SBC comments at 89; Western Alliance comments at 6-7; *but see* BellSouth comments at 57 (if the universal service proceeding establishes a federal fund or if the states establish explicit funds, there will be no need for subsidies to be built into interconnection and unbundled network element rates).

1656 Attorneys General reply at 10-11.

believe that the prices that potential entrants pay for these elements should reflect forward-looking economic costs in order to encourage efficient levels of investment and entry.

* * * *

678. While we are adopting a version of the methodology commonly referred to as TSLRIC as the basis for pricing interconnection and unbundled elements, we are coining the term "total element long run incremental cost" (TELRIC) to describe our version of this methodology. The incumbent LEC offerings to be priced using this methodology generally will be "network elements," rather than "telecommunications services," as defined by the 1996 Act.[1683] More fundamentally, we believe that TELRIC-based pricing of discrete network elements or facilities, such as local loops and switching, is likely to be much more economically rational than TSLRIC-based pricing of conventional services, such as interstate access service and local residential or business exchange service. As discussed in greater detail below, separate telecommunications services are typically provided over shared network facilities, the costs of which may be joint or common with respect to some services. The costs of local loops and their associated line cards in local switches, for example, are common with respect to interstate access service and local exchange service, because once these facilities are installed to provide one service they are able to provide the other at no additional cost. By contrast, the network elements, as we have defined them,[1684] largely correspond to distinct network facilities. Therefore, the amount of joint and common costs that must be allocated among separate offerings is likely to be much smaller using a TELRIC methodology rather than a TSLRIC approach that measures the costs of conventional services. Because it is difficult for regulators to determine an economically-optimal allocation of any such joint and common costs, we believe that pricing

---

[1683] 47 U.S.C. §§ 3(29), 3(46).

[1684] *See supra* Section V.

elements, defined as facilities with associated features and functions, is more reliable from the standpoint of economic efficiency than pricing services that use shared network facilities.

679. *Description of TELRIC-Based Pricing Methodology.* Adopting a pricing methodology based on forward-looking, economic costs best replicates, to the extent possible, the conditions of a competitive market. In addition, a forward-looking cost methodology reduces the ability of an incumbent LEC to engage in anti-competitive behavior. Congress recognized in the 1996 Act that access to the incumbent LECs' bottleneck facilities is critical to making meaningful competition possible. As a result of the availability to competitors of the incumbent LEC's unbundled elements at their economic cost, consumers will be able to reap the benefits of the incumbent LECs' economies of scale and scope, as well as the benefits of competition. Because a pricing methodology based on forward-looking costs simulates the conditions in a competitive marketplace, it allows the requesting carrier to produce efficiently and to compete effectively, which should drive retail prices to their competitive levels. We believe that our adoption of a forward-looking cost-based pricing methodology should facilitate competition on a reasonable and efficient basis by all firms in the industry by establishing prices for interconnection and unbundled elements based on costs similar to those incurred by the incumbents, which may be expected to reduce the regulatory burdens and economic impact of our decision for many parties, including both small entities seeking to enter the local exchange markets and small incumbent LECs.[1685]

* * * *

682. We conclude that, under a TELRIC methodology, incumbent LECs' prices for interconnection and unbundled network elements shall recover the forward-look-

---

[1685] *See* Regulatory Flexibility Act, 5 U.S.C. §§ 601 *et seq.*

ing costs directly attributable to the specified element, as well as a reasonable allocation of forward-looking common costs. Per-unit costs shall be derived from total costs using reasonably accurate "fill factors" (estimates of the proportion of a facility that will be "filled" with network usage); that is, the per-unit costs associated with a particular element must be derived by dividing the total cost associated with the element by a reasonable projection of the actual total usage of the element. Directly attributable forward-looking costs include the incremental costs of facilities and operations that are dedicated to the element. Such costs typically include the investment costs and expenses related to primary plant used to provide that element. Directly attributable forward-looking costs also include the incremental costs of shared facilities and operations. Those costs shall be attributed to specific elements to the greatest extent possible.[1688] For example, the costs of conduits shared by both transport and local loops, and the costs of central office facilities shared by both local switching and tandem switching, shall be attributed to specific elements in reasonable proportions. More broadly, certain shared costs that have conventionally been treated as common costs (or overheads) shall be attributed directly to the individual elements to the greatest extent possible. The forward-looking costs directly attributable to local loops, for example, shall include not only the cost of the installed copper wire and telephone poles but also the cost of payroll and other back office operations relating to the line technicians, in addition to other attributable costs.

* * * *

684. Under the second approach, the cost of interconnection and unbundled network elements would be based on existing network design and technology that are cur-

---

[1688] *Compare Telephone Company-Cable Television Cross-Ownership Rules*, CC Docket No. 87-266, Memorandum Opinion and Order on Reconsideration and Third Further Notice of Proposed Rulemaking, 10 FCC Rcd 244, 345-46 (1994).

rently in operation.[1689] Because this approach is not based on a hypothetical network in the short run, incumbent LECs could recover costs based on their existing operations, and prices for interconnection and unbundled elements that reflect inefficient or obsolete network design and technology. This is essentially an embedded cost methodology.

685. Under the third approach, prices for interconnection and access to unbundled elements would be developed from a forward-looking economic cost methodology based on the most efficient technology deployed in the incumbent LEC's current wire center locations. This approach mitigates incumbent LECs' concerns that a forward-looking pricing methodology ignores existing network design, while basing prices on efficient, new technology that is compatible with the existing infrastructure. This benchmark of forward-looking cost and existing network design most closely represents the incremental costs that incumbents actually expect to incur in making network elements available to new entrants. Moreover, this approach encourages facilities-based competition to the extent that new entrants, by designing more efficient network configurations, are able to provide the service at a lower cost than the incumbent LEC. We, therefore, conclude that the forward-looking pricing methodology for interconnection and unbundled network elements should be based on costs that assume that wire centers will be placed at the incumbent LEC's current wire center locations, but that the reconstructed local network will employ the most efficient technology for reasonably foreseeable capacity requirements.

686. We agree with USTA, Bell Atlantic, and BellSouth that, as a theoretical matter, the combination of significant sunk investment, declining technology costs, and competitive entry may increase the depreciation costs

---

[1689] *See, e.g.*, BellSouth reply at 37; Roseville Tel. reply at 8; USTA reply at 18-19.

and cost of capital of incumbent LECs. We do not agree, however, that TSLRIC does not or cannot account for risks that an incumbent LEC incurs because it has sunk investments in facilities. On the contrary, properly designed depreciation schedules should account for expected declines in the value of capital goods. Both AT&T and MCI appear to agree with this proposition.[1690] For example, AT&T states, "[i]n order to estimate TSLRIC, one must perform a discounted cash flow analysis of the future costs associated with the decision to invest . . . . One-time costs associated with the acquisition of capital goods are amortized over the economic life of the assets using the user cost of capital . . . , which requires accounting for both expected capital good price changes and economic depreciation." [1691] Moreover, we are confident that parties to an arbitration with TELRIC studies can propose specific depreciation rate adjustments that reflect expected asset values over time.

* * * *

690. *Summary of TELRIC Methodology.* The following summarizes our conclusions regarding setting prices of interconnection and access to unbundled network elements based on the TELRIC methodology for such elements. The increment that forms the basis for a TELRIC study shall be the entire quantity of the network element provided. As we have previously stated, all costs associated

---

with the providing the element shall be included in the incremental cost. Only forward-looking, incremental costs shall be included in a TELRIC study. Costs must be based on the incumbent LEC's existing wire center locations and most efficient technology available.

* * * *

695. The incumbent LECs generally argue that common costs are quite significant,[1607] while several other parties maintain that these amounts are minimal.[1608] Because the unbundled network elements correspond, to a great extent, to discrete network facilities, and have different operating characteristics, we expect that common costs should be smaller than the common costs associated with the long-run incremental cost of a service. We expect that many facility costs that may be common with respect to the individual services provided by the facilities can be directly attributed to the facilities when offered as unbundled network elements. Moreover, defining the network elements at a relatively high level of aggregation, as we have done,[1609] should also reduce the magnitude of the common costs. A properly conducted TELRIC methodology will attribute costs to specific elements to the greatest possible extent, which will reduce the common costs. Nevertheless, there will remain some common costs that must be allocated among network elements and interconnection services. For example, at the sub-element level of study (*e.g.*, identifying the respective costs of 2-wire loops, 4-wire loops, ISDN loops, and so on), common costs may be a significant proportion of all the costs that must be recovered from sub-elements. Given the likely asymmetry of information regarding network costs, we conclude that,

---

[1607] *See, e.g.*, PacTel reply at 27-28; *see also* Cincinnati Bell reply at 10; USTA comments at Attachment 1 (Affidavit of Jerry A. Hausman), p.4 n.1.

[1608] *See, e.g.*, Competition Policy Institute comments at 19; MCI comments at 66; Texas Public Utility Counsel comments at 24.

[1609] *See supra*, Section V., discussing unbundling requirements.

in the arbitration process, incumbent LECs shall have the burden to prove the specific nature and magnitude of these forward-looking common costs.

696. We conclude that forward-looking common costs shall be allocated among elements and services in a reasonable manner, consistent with the pro-competitive goals of the 1996 Act. One reasonable allocation method would be to allocate common costs using a fixed allocator, such as a percentage markup over the directly-attributable forward-looking costs. We conclude that a second reasonable allocation method would allocate only a relatively small share of common costs to certain critical network elements, such as the local loop and collocation, that are most difficult for entrants to replicate promptly (*i.e.*, bottleneck facilities). Allocation of common costs on this basis ensures that the prices of network elements that are least likely to be subject to competition are not artificially inflated by a large allocation of common costs. On the other hand, certain other allocation methods would not be reasonable. For example, we conclude that an allocation methodology that relies exclusively on allocating common costs in inverse proportion to the sensitivity of demand for various network elements and services may not be used.[1700] We conclude that such an allocation could unreasonably limit the extent of entry into local exchange markets by allocating more costs to, and thus raising the prices of, the most critical bottleneck inputs, the demand for which tends to be relatively inelastic. Such an alloca-

[1700] *See* Frank P. Ramsey, *A Contribution to the Theory of Taxation*, 37 Econ. J. 47 (1927); *see generally* Kenneth E. Train, *Optimal Regulation: The Economic Theory of Natural Monopoly* 115-40 (1992) (discussing efficiency properties of Ramsey prices); Bridger M. Mitchell & Ingo Vogelsang, *Telecommunications Pricing: Theory and Practices* 43-61 (1991). The sensitivity of demand is measured by the elasticity of demand, which is defined as the percentage change in the quantity of a service demanded for a one per cent change in price.

tion of these costs would undermine the pro-competitive objectives of the 1996 Act.

* * * *

699. *Reasonable Return on Investment and "Profit."* Section 252(d)(1) states that rates for interconnection and access to unbundled elements "may include a reasonable profit."[1703] We find that the TELRIC pricing methodology we are adopting provides for such a reasonable profit and thus no additional profit is justified under the statutory language. We note there are two types of profit. First, in plain English, profit is defined as "the excess of returns over expenditure in a transaction or a series of transactions."[1704] This is also known as a "normal" profit, which is the total revenue required to cover all of the costs of a firm, including its opportunity costs.[1705] Second, there is "economic" profit, which is any return in excess of normal profit.[1706] Thus, for example, if the normal return in an industry is 10 percent and a firm earns a return of 14 percent, the economic profit for that firm is 4 percent. Economic is also referred to as "supranormal" profit. We conclude that the definition of "normal" profit is embodied in "reasonable profit" under Section 252 (d)(1).

700. The concept of normal profit is embodied in forward-looking costs because the forward-looking cost of capital, *i.e.*, the cost of obtaining debt and equity financing, is one of the forward-looking costs of providing the network elements. This forward-looking cost of capital is equal to a normal profit. We conclude that allowing greater than normal profits would not be "reasonable" under sections 251(c) and 252(d)(1).[1707] Thus, contrary

[1706] *Id.* at 415.

[1707] We note that our interpretation is consistent with existing Supreme Court precedent concerning what constitutes a reasonable

to the arguments put forth by several incumbent LECs, we find that adding an additional measure of profit to the risk-adjusted cost of capital [1708] in setting the prices for interconnection and access to unbundled elements would violate the requirements of sections 251(c) and 252 (d)(1) of the 1996 Act.

701. Possible accounting losses from the sale of interconnection and unbundled network elements using a reasonable forward-looking cost-based methodology do not neces-

---

rate of return for a regulated public utility. For example, in *Bluefield Water Works*, the Court stated:

> A public utility is entitled to such rates as will permit it to earn a return on the value of the property which it employs for the convenience of the public equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties; but it has no constitutional right to profits such as are realized or anticipated in highly profitable enterprises or speculative ventures.

Bluefield Water Works & Improvement Co. v. Public Service Comm'n of West Virginia, 262 U.S. 679, 692-93 (1923). Similarly, in *FPC v. Hope Natural Gas*, the Court stated:

> . . . it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business. These include service on the debt and dividends on the stock . . . By that standard the return to the equity owner should be commensurate with risks on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital.

Federal Power Comm'n v. Hope Natural Gas Co., 320 U.S. 591, 603 (1994) (*Hope Natural Gas*). *Cf.*, Charles F. Phillips, Jr., *The Economics of Regulation* 260 (Rev. ed. 1965) (". . . a regulated company must be afforded the opportunity not only of assuring its financial integrity so that it can maintain its credit standing and attract additional capital as needed, but also for earnings comparable to those of other companies having corresponding risks.").

[1708] *See supra*, this Section, for a discussion of risk-adjusted cost of capital.

sarily indicate that incumbent LECs are being denied a "reasonable profit" under the statute. The use of a forward-looking, economic, cost-based pricing methodology, including a reasonable allocation of legitimate joint and common costs, will permit incumbent LECs the opportunity to earn a reasonable return on their investment in network elements. Finally, contrary to PacTel's argument, and as discussed below in detail, we conclude that our forward-looking cost-based pricing methodology is consistent with the Fifth Amendment and is not confiscatory.

702. Based on the current record, we conclude that the currently authorized rate of return at the federal or state level is a reasonable starting point for TELRIC calculations, and incumbent LECs bear the burden of demonstrating with specificity that the business risks that they face in providing unbundled network elements and interconnection services would justify a different risk-adjusted cost of capital or depreciation rate. These elements generally are bottleneck, monopoly services that do not now face significant competition. We recognize that incumbent LECs are likely to face increased risks given the overall increases in competition in this industry, which generally might warrant an increased cost of capital, but note that, earlier this year, we instituted a preliminary inquiry as to whether the currently authorized federal 11.25 percent rate of return is too high given the current marketplace cost of equity and debt.[1709] On the basis of the current record, we decline to engage in a time-consuming examination to determine a new rate of return, which may well require a detailed proceeding. States may adjust the cost of capital if the party demonstrates to a state commission that either a higher or lower level of cost of capital is warranted, without that commission conducting a "rate-of-return or other rate based proceeding."[1710] We note that the risk-

---

[1709] *See Common Carrier Bureau Sets Pleading Schedule in Preliminary Rate of Return Inquiry*, Public Notice, 11 FCC Rcd 3651 (Com. Car. Bur. 1996).

[1710] 47 U.S.C. § 252(d)(1)(A)(i).

adjusted cost of capital need not be uniform for all elements. We intend to re-examine the issue of the appropriate risk-adjusted cost of capital on an ongoing basis, particularly in light of the state commissions' experiences in addressing this issue in specific situations.

703. We disagree with the conclusion that, when there are mostly sunk costs, forward-looking economic costs should not be the basis for pricing interconnection elements. The TELRIC of an element has three components, the operating expenses, the depreciation cost,[1711] and the appropriate risk-adjusted cost of capital. We conclude that an appropriate calculation of TELRIC will include a depreciation rate that reflects the true changes in economic value of an asset and a cost of capital that appropriately reflects the risks incurred by an investor. Thus, even in the presence of sunk costs, TELRIC-based prices are an appropriate pricing methodology.

(b) Cost Measures Not Included in Forward-Looking Cost Methodology

704. *Embeded Costs.* We read section 252(d)(1)(A)(i) to prohibit states from conducting traditional rate-of-return or other rate-based proceedings to determine rates for interconnection and access to unbundled network elements. We find that the parenthetical, "(determined without reference to a rate-of-return or other rate-based proceeding)," [1712] does not further define the type of costs that may be considered, but rather specifies a type of proceeding that may not be employed to determine the cost of interconnection and unbundled network elements. The legislative history demonstrates that Congress was eager to set in motion expeditiously the development of local com-

---

[1711] Depreciation is the method of recognizing as an expense the cost of a capital investment. Properly calculated economic depreciation is a periodic reduction in the book value of an asset that makes the book value equal to its economic or market value.

[1712] 47 U.S.C. § 252(d)(1)(A)(i).

petition and intended to avoid imposing the costs and administrative burdens associated with a traditional rate case. Prior to the joint conference, the Senate version of the 1996 Act contained the parenthetical language.[1713] In addition, the Senate version of the 1996 Act eliminated rate-of-return regulation,[1714] as did the House version.[1715] Conferees removed the provisions eliminating rate-of-return regulation, but retained the parenthetical.

705. Section 252(d)(1)(A)(i) does not specify whether historical or embedded costs should be considered or whether only forward-looking costs should be considered in setting arbitrated rates. We are not persuaded by incumbent LEC arguments that prices for interconnection and unbundled network elements must or should include any difference between the embedded costs they have incurred to provide those elements and their current economic costs. Neither a methodology that establishes the prices for interconnection and access to network elements directly on the costs reflected in the regulated books of account, nor a price based on forward looking costs plus an additional amount reflecting embedded costs, would be

---

[1713] S. 652, 104th Cong., 1st Sess. § 251(d)(6)(A) (1995) ("the charge (A) shall be (i) based on the cost (determined without reference to a rate-of-return or other rate-based proceeding) of providing the unbundled element . . . .").

[1714] *Id.* at § 301(a)(3) ("Rate of Return Regulation Eliminated—(A) In instituting the price flexibility required under paragraph (1) the Commission and the States shall establish alternative forms of regulation for Tier 1 telecommunications carriers that do not include regulation of the rate of return earned by such carrier . . . .").

[1715] H.R. 1555, 104th Cong., 1st Sess. § 248(b) (1995) ("Abolition of Rate-of-Return Regulation—Notwithstanding any other provision of law, to the extent that a carrier has complied with sections 242 and 244 of this part, the Commission, with respect to rates for interstate or foreign communications, and State commissions, with respect to rates for intrastate communications, shall not require rate-of-return regulation.").

consistent with the approach we are adopting. The substantial weight of economic commentary in the record suggests that an "embedded cost"-based pricing methodology would be pro-competitor—in this case the incumbent LEC—rather than pro-competition.[1716] We therefore decline to adopt embedded costs as the appropriate basis of setting prices for interconnection and access to unbundled elements. Rather, we reiterate that the prices for the interconnection and network elements critical to the development of a competitive local exchange should be based on the pro-competition, forward-looking, economic costs of those elements, which may be higher or lower than historical embedded costs. Such pricing policies will best ensure the efficient investment decisions and competitive entry contemplated by the 1996 Act, which should minimize the regulatory burdens and economic impact of our decisions on small entities.[1717]

706. Incumbent LECs contend generally that, in order to ensure they will recover their total investment costs and earn a profit, they must recover embedded costs. These costs, they argue, were incurred under federal and regulatory oversight and therefore should be recoverable.[1718] We are not convinced by the incumbent LECs' principal arguments for recognizing embedded cost in setting section 251 pricing rules. Even if the incumbent LECs' contention is correct, increasing the rates for interconnection and unbun-

dled elements offered to competitors would interfere with the development of efficient competition, and is not the proper remedy for any past under-depreciation. Moreover, contrary to assertions by some incumbent LECs, regulation does not and should not guarantee full recovery of their embedded costs. Such a guarantee would exceed the assurances that we or the states have provided in the past.[1719] We have considered the economic impact of precluding recovery of small incumbent LECs' embedded costs.[1720] We do not believe that basing the prices of interconnection and unbundled elements on an incumbent LEC's embedded costs would advance the pro-competitive goals of the statute. We also note that certain small incumbent LECs are not subject to our rules under section 251(f)(1) of the 1996 Act, unless otherwise determined by a state commission, and certain other small incumbent LECs may seek relief from their state commissions from our rules under section 251(f)(2) of the 1996 Act.[1721]

707. We acknowledge that some incumbent LECs may have incurred certain embedded costs reasonably before the passage of the 1996 Act, based on different regulatory regimes. Some incumbent LECs may assert that they have made certain historical investments required by regulators that they have been denied a reasonable opportunity to recover in the past and that the incumbent LECs may no longer have a reasonable opportunity to recover in the new environment of the 1996 Act. The record before us, however, does not support the conclusion that significant residual embedded costs will necessarily result from the availability of network elements at economic costs. To the extent that any such residual consists of costs of meeting universal service obligations, the recovery of such costs can and should be considered in our ongoing universal service

---

[1721] 47 U.S.C. § 251(f).

proceeding.[1722] To the extent a significant residual exists within the interstate jurisdiction that does not fall within the ambit of section 254, we intend that to address that issue in our upcoming proceeding on access reform.

708. *Opportunity Cost—Efficient Component Pricing Rule.* A number of incumbent LECs advocate using the "efficient component pricing rule" (ECPR) to set the prices that incumbent LECs charge new entrants for inputs required to produce the same retail services the incumbent produces. Under the ECPR, the price of an input should be equal to the incremental cost of the input plus the opportunity cost that the incumbent carrier incurs when the new entrant provides the services instead of the incumbent. The opportunity cost, which is computed as revenues less all incremental costs, represents both profit and contribution to common costs of the incumbent, given the existing retail prices of the services being sold.

709. We conclude that ECPR is an improper method for setting prices of interconnection and unbundled network elements because the existing retail prices that would be used to compute incremental opportunity costs under ECPR are not cost-based. Moreover, the ECPR does not provide any mechanism for moving prices towards competitive levels; it simply takes prices as given. The record indicates that both incumbents and new entrants agree that retail prices are not based on costs. Incumbents generally argue that local residential retail prices are below costs while new entrants contend that they exceed competitive levels.[1723] In either case, application of ECPR would result in input prices that would be either higher or lower than those which would be generated in a competitive market and would not lead to efficient retail pricing.

710. In markets where retail prices exceed competitive levels, entry would take place if network element prices

---

[1722] *See Universal Service* NPRM at para. 32.

[1723] *See, e.g.*, Ameritech comments at 62.

were set at efficient competitive levels. The ECPR, however, will serve to discourage competition in these very markets because it relies on the prevailing retail price in setting the price which new entrants pay the incumbent for inputs. While ECPR establishes conditions for efficient entry given existing retail prices, as its advocates contend, the ECPR provides no mechanism that will force retail prices to their competitive levels. We do not believe that Congress envisioned a pricing methodology for interconnection and network elements that would insulate incumbent LECs' retail prices from competition. Instead, Congress specifically determined that input prices should be based on costs because this would foster competition in the retail market. Therefore, we reject the use of ECPR for establishing prices for interconnection and unbundled elements.

711. As discussed above, the record in this docket shows that end user prices are not cost-based. In *Open Video Systems,* in contrast, we did not find that there would be a problem with the determination of end user prices.[1724] We concluded that "[u]se of [an ECPR] approach is appropriate in circumstances where the pricing is applicable [sic] to a new market entrant (the open video system operator) that will face competition from an existing incumbent provider (the incumbent cable operator) as opposed to circumstances where the pricing is used to establish a rate for an essential input service that is charged to a competing new entrant by an incumbent provider."[1725] In addition, in *Open Video Systems,* we concluded that the ECPR is appropriate because it encourages entry for open video system operators and also enhances the availability of carriage for unaffiliated programmers.[1726] The

---

[1724] *Implementation of Section 302 of the Telecommunications Act of 1996—Open Video Systems,* CS Docket No. 96-46, Second Report and Order, FCC 96-249 (rel. June 3, 1996) (*Open Video Systems*).

[1725] *Id.* at 127.

[1726] *Id.*

ECPR generally protects the provider's profits and provides opportunities for third parties to use the provider's inputs. The ECPR does not provide a mechanism to drive retail prices to competitive levels, however. In *Open Video Systems,* we wanted to encourage entry by open video system providers and to encourage them to have incentives to open their systems to unaffiliated programmers. Here, our goal is to ensure that competition between providers, including third party providers using interconnection and unbundled elements, will drive prices toward competitive levels and thus use of the ECPR is inappropriate.

712. *Universal Service Subsidies.* We conclude that funding for any universal service mechanisms adopted in the universal service proceeding may not be included in the rates for interconnection, network elements, and access to network elements that are arbitrated by the states under sections 251 and 252. Sections 254(d) and 254(e) of the 1996 Act mandate that universal service support be recovered in an equitable and nondiscriminatory manner from all providers of telecommunications services.[1727] We conclude that permitting states to include such costs in rates arbitrated under sections 251 and 252 would violate that requirement by requiring carriers to pay specified portions of such costs solely because they are purchasing services and elements under section 251. Section 252 (d)(1) requires that rates for interconnection, network elements, and access to network elements reflect the costs of providing those network elements, not the costs of supporting universal service.

713. Section 254(f) provides that a state may adopt equitable, nondiscriminatory, specific, and predictable mechanisms to advance universal service within that

---

[1727] Joint Explanatory Statement at 131 ("In keeping with the conferees' intent that universal service support should be clearly identified, [section 254(e)] states that such support should be made explicit . . .").

state.[1728] If a state collects universal service funding in rates for elements and services pursuant to sections 251 and 252, it will be imposing non-cost based charges in those rates. Including non-cost based charges in the rates for interconnection and unbundled elements is inconsistent with our rules implementing sections 251 and 252 which require that these rates be cost-based. It is also inconsistent with the requirement of section 254(f) that telecommunications carriers contribute to state universal service on a nondiscriminatory basis, because telecommunications carriers requesting interconnection or access to unbundled network elements will be required to make contributions to universal service support through such surcharges.[1729] States may not, therefore, include universal service support funding in the rates for elements and services pursuant to sections 251 and 252, nor may they implement mechanisms that have the same effect. For example, states may not fund universal service support by imposing higher rates for interconnection, unbundled elements, or transport and termination on carriers that offer service to different types of customers or different geographic areas. To the extent that New York's "pay or play" system funds universal service in this manner, it violates sections 251, 252, and 254 of the 1996 Act. Nothing in the 1996 Act or in this Order, however, precludes a state from adopting a universal service funding mechanism, whether interim or otherwise, if such funds are collected in accordance with section 254(f) on an "equitable and nondiscriminatory basis" through "specific, predictable, and sufficient mechanisms that do not rely on or burden Federal universal service support mechanisms." [1730]

714. Our decision here does not exempt carriers purchasing elements or services under section 251 from con-

---

[1728] 47 U.S.C. § 254(f).

[1729] *See infra*, Section VII.D.3, discussing discrimination.

[1730] 47 U.S.C. § 254(f).

tributing to (or possibly receiving) universal service support. Rather, the recovery of universal service support costs from telecommunications carriers, including carriers requesting unbundled network elements, will be governed by section 254 of the 1996 Act. Federal universal service support mechanisms will be determined by our decisions reached in CC Docket 96-45, based on the recommendations of the Federal/State Universal Service Joint Board, and states may adopt additional universal service support mechanisms consistent with section 254(f).

715. We are mindful that the requirements of the 1996 Act may be disruptive to existing state universal service support mechanisms during the period commencing with this order continuing until we complete our universal service proceeding to implement section 254. As discussed in the subsection immediately below, we permit incumbent LECs to continue to recover certain non-cost-based interstate access charge revenues for a limited period of time, largely because of concerns about possible deleterious impacts on universal service. We also authorize incumbent LECs, for a similar limited period of time, to continue to recover explicit intrastate universal service subsidy revenues based on intrastate access charges. This mechanism minimizes any possibility that implementation of sections 251 and 252 will unduly harm universal service during the interim period prior to completion of our universal service and access reform proceedings. Because we conclude this action should adequately provide for the continuation of a portion of existing subsidy flows during a transition period until completion of our proceeding implementing section 254, we decline to permit any additional funding of universal service support through rates for interconnection, unbundled elements, and transport and termination during the interim period.

716. *Interim Application of Access Charges to Purchasers of Unbundled Local Switching Element.* In the introduction of this Order, we emphasize that implementa-

tion of section 251 of the 1996 Act is integrally related to both universal service reform as required under section 254, and to reform of the interstate access charge system.[1731] In order to achieve pro-competitive, deregulatory markets for all telecommunications services, we must create a new system of funding universal service that is specific, explicit, predictable, sufficient, and competitively neutral. We also must move access charges to more cost-based and economically efficient levels. We intend to fulfill both of these goals in the coming months, by completing our pending universal service proceeding to implement section 254 by our statutory deadline of May 1997, and by addressing access charge issues in an upcoming access reform proceeding. The 1996 Act, however, requires us to adopt rules implementing section 251 by August 1996. We are concerned that implementation of the requirements of section 251 now, without taking into account the effects of the new rules on our existing access charge and universal service regimes, may have significant, immediate, adverse effects that were neither intended nor foreseen by Congress.

717. Specifically, as we conclude above, the 1996 Act permits telecommunications carriers that purchase access to unbundled network elements from incumbent LECs to use those elements to provide telecommunications services, including the origination and termination of interstate calls. Without further action on our part, section 251 would allow entrants to use those unbundled network facilities to provide access services to customers they win from incumbent LECs, without having to pay access charges to the incumbent LECs. This result would be consistent with the long term outcome in a competitive market. In the short term, however, while other aspects of our regulatory regime are in the process of being reformed, such a change may have detrimental consequences.

[1731] *See supra*, Section I.B.

718. The access charge system includes non-cost-based components and elements that at least in part may represent subsidies, such as the carrier common line charge (CCLC) and the transport interconnection charge (TIC). The CCLC recovers part of the allocated interstate costs for incumbent LECs to provide local loops to end users. In the universal service NPRM, we observed that the CCLC may result in higher-volume toll users paying rates that exceed cost, and some customers paying rates that are below cost. We sought comment on whether that subsidy should be continued, and on whether and how it should be restructured.[1732] The nature of much of the revenues recovered through the TIC is unclear and subject to dispute, although a portion of the TIC is associated with certain costs related to particular transport facilities. Although the TIC was not created to subsidize local rates, some parties have argued in the *Transport* proceeding and elsewhere that some portion of the revenues now recovered through the TIC may be misallocated local loop or intrastate costs that operate to support universal service.[1733] In the forthcoming access reform proceeding, we intend to consider the appropriate disposition of the TIC, including the development of cost-based transport rates as directed by the United States Court of Appeals for the District of Columbia Circuit in *Competitive Telecommunications Association v. FCC* (*CompTel v. FCC*).[1734]

[1732] *Universal Service* NPRM at paras. 113-14.

[1733] *Transport Rate Structure and Pricing*, CC Docket No. 91-213, Report and Order and Further Notice of Proposed Rulemaking, 7 FCC Rcd 7006, 7065-7066 (1992) (*First Transport Order*). *Cf.* Letter from Bruce K. Cox, Government Affairs Director, AT&T, to William F. Caton, Acting Secretary, FCC, September 7, 1995 (filed in CC Docket No. 91-213) (suggesting that TIC revenues not allocable to specific transport facilities may represent misallocated common line costs).

[1734] *Competitive Telecommunications Association v. FCC*, No. 96-1168 (D.C. Cir. July 5, 1996).

719. Without a temporary mechanism such as the one we adopt below, the implementation of section 251 would permit competitive local service providers that also provide interstate long-distance service to avoid totally the CCLC and the TIC, which in part represent contributions toward universal service, by serving their local customers solely through the use of unbundled network elements rather than through resale. We believe that allowing such a result before we have reformed our universal service and access charge regimes would be undesirable as a matter of both economics and policy, because carrier decisions about how to interconnect with incumbent LECs would be driven by regulatory distortions in our access charge rules and our universal service scheme, rather than the unfettered operation of a competitive market. Because of our desire to err on the side of caution where universal service may be implicated, we conclude that some action is needed during the interim period before we complete our access reform and universal service proceedings.

720. We conclude that we should establish a temporary mechanism to help complete all of the steps toward the pro-competitive goal of the 1996 Act, including the implementation of a new, competitively-neutral system to fund universal service and a comprehensive review of our system of interstate access charges. Therefore, for a limited period of time, incumbent LECs may recover from interconnecting carriers the CCLC and a charge equal to 75 percent of the TIC for all interstate minutes traversing the incumbent LECs' local switches for which the interconnecting carriers pay unbundled local switching element charges. Incumbent LECs may recover these charges only until the earliest of: (1) June 30, 1997; (2) the effective date of final decisions by the Commission in both the universal service and access reform proceedings; or (3) if the incumbent LEC is a BOC, the date on which that BOC is authorized under section 271 of the 1996 Act to offer in-region interLATA service. The end date for

BOCs that are authorized to offer interLATA service shall apply only to the recovery of access charges in those states in which the BOC is authorized to offer such service.

721. We tentatively concluded in the NPRM that purchasers of unbundled network elements should not be required to pay access charges. We reaffirm our conclusion above in our discussion of unbundled network elements that nothing on the face of sections 251(c)(3) and 252(d)(1) compels telecommunications carriers that use unbundled elements to pay these charges, nor limits these carriers' ability to use unbundled elements to originate or terminate interstate calls, and that payment of rates based on TELRIC plus a reasonable allocation of common costs, pursuant to section 251(d)(1), represents full compensation to the incumbent LEC for use of the network elements that telecommunications carriers purchase. Because of the unique situation described in the preceding paragraphs, however, we conclude, contrary to our proposal in the NPRM, that during a time-limited period, interconnecting carriers should not be able to use unbundled elements to avoid access charges in all cases. As detailed below, this temporary mechanism will apply only to carriers that purchase the local switch as an unbundled network element, and use that element to originate or terminate interstate traffic.[1785] We are applying these transitional charges to the unbundled local switching element, rather than to any other network elements, because such an approach is most closely analogous to the manner in which the CCLC and TIC are recovered in the interstate access regime. Currently, the CCLC and TIC apply to interstate switched access minutes that traverse incumbent LECs' local switches. Applying the CCLC and

[1785] As discussed *infra*, carriers that choose to enter a local market through resale of an incumbent LEC's intrastate local exchange service will pay interstate and intrastate access charges to originate and terminate toll traffic for end user customers that purchase that resold local exchange service.

75 percent of the TIC to the unbundled local switching element is consistent with our goal of minimizing disruptions while we reform our universal service system and consider changes to our access charge mechanisms. Moreover, the CCLC and the TIC are recovered on a per-minute basis, and the local switch is the primary point at which incumbent LECs are capable of recording interstate minutes for traffic associated with end user customers of requesting carriers.

722. We have crafted this short-term continuation of certain access charge revenue flows to minimize the possibility that incumbent LECs will be able to "double recover" through access charges the facility costs that new entrants have already paid to purchase unbundled elements. For that reason, we do not permit incumbent LECs to assess on purchasers of the unbundled local switching element any interstate access charges other than the CCLC and 75 percent of the TIC. The other access charges are all designed to recover the cost of particular facilities involved in the provision of interstate access services, such as local switching, dedicated interoffice transport circuits, and tandem switching. Imposition of these facility-based access charges in addition to the cost-based charges for comparable network elements established under Section 252 could result in double recovery. The mechanism we establish will ensure that incentives created by non-cost-based elements of access charges do not result in harmful consequences prior to completion of access reform and our universal service proceeding. Imposition of additional access charges is therefore not necessary. We note that this mechanism serves to minimize the potentially disruptive effects of our decisions on incumbent LECs, including small incumbent LECs.[1736]

723. For the same reason, we permit incumbent LECs to recover only 75 percent of the TIC. Some portion of

---

[1736] *See* Regulatory Flexibility Act, 5 U.S.C. §§ 601 *et seq.*

the TIC recovers revenues associated with specific transport facilities. To the extent that these costs can be identified clearly, they should not be imposed on new entrants through the TIC. Incumbent LECs will be fully compensated for any transport facilities that new entrants purchase from them through the unbundled element rates states establish under 252(d)(1), which, as we have stated, must be based on economic cost rather than access charges. In our interim transport rate restructuring, we explicitly set the initial tandem switching rate at 20 percent of the interstate revenue requirement, with the remainder included in the TIC.[1737] In addition, certain costs of upgrading incumbent LEC networks to support SS7 signaling were allocated to transport through then-existing separations procedures. In our interim transport rate restructuring, we did not create any facility-based charges to recover these costs,[1738] so the associated revenues presumably were incorporated into the TIC. There may also be other revenues associated with transport facilities that are recovered today through the TIC. While we are uncertain of the precise magnitude of these revenues, in our best judgment, based on the record in the *Transport* proceeding and other information before us, we find that it is likely that these revenues approach, but probably do not exceed 25 percent of the TIC for most incumbent LECs. Thus, we believe that 25 percent is a conservative amount to exclude from the TIC to ensure that incumbent LECs do not double recover revenues associated with transport facilities from new entrants. Moreover, the Court in *CompTel v. FCC* remanded our *Transport* decision, in part, because of the inclusion of tandem switching revenues in the TIC rather than in the rate element for tandem switching. We find that excluding 25 percent of the TIC represents a reasonable exercise of our discretion to prevent revenues associated with the tandem

---

[1737] *First Transport Order*, 7 FCC Rcd at 7019.

[1738] *First Transport Order*, 7 FCC Rcd at 7019.

switching revenue requirement from being recovered from purchasers or unbundled local switching.

724. We strongly emphasize that these charges will apply to purchasers of the unbundled switching element only for a very limited period, to avoid the possible harms that might arise if we were to ignore the effects on access charges and universal service of implementation of section 251. BOCs shall not be permitted to recover these revenues once they are authorized to offer in-region interLATA service, because at that time the potential loss of access charge revenues faced by a BOC most likely will be able to be offset by new revenues from interLATA services. Moreover, although we do not prejudge the conditions necessary to grant BOC petitions under section 271 to offer in-region interLATA service, we do decide that BOCs should not be able to charge the CCLC and the TIC, which are not based on forward-looking economic costs, to competitors that use unbundled elements under section 251 once they are authorized to provide in-region interLATA service. Only BOCs are subject to special restrictions in the 1996 Act to ensure that their entry into the in-region interLATA market does not have an adverse impact on competition. We conclude that this additional trigger date after which BOCs may not continue to receive access charges from purchasers of unbundled local switching is consistent with this Congressional design.

725. We have selected June 30, 1997 as an ultimate end date for this transitional mechanism to coincide with the effective date for LEC annual access tariffs, and because we believe it is imperative that this transitional requirement be limited in duration. We can conceive of no circumstances under which the requirement that certain entrants pay the CCLC or a portion of the TIC on calls carried over unbundled network elements would be extended further. The fact that access or universal service reform have not been completed by that date would not

be a sufficient justification, nor would any actual or asserted harm to the financial status of the incumbent LECs. By June 30, 1997, the industry will have had sufficient time to plan for and adjust to potential revenue shifts that may result from competitive entry. Thus, the economic impact of our decision on competitive local service providers, including those that are small entities, should be minimized.[1739]

726. We believe that we have ample legal authority to implement this temporary transitional measure, and we find that this approach is consistent with the letter and spirit of the 1996 Act. We recognize that the CCLC and TIC have not been developed in accordance with the pricing standards of section 252(d)(1), and that to comply with the 1996 Act, the rates that states establish for interconnection and unbundled network elements may not include non-cost-based amounts or subsidies. The 1934 and 1996 Acts do, however, give us legal authority to determine, for policy reasons, that users of LEC facilities should pay certain access charges for a period of time.[1740] Section 4(i) of the 1934 Act authorizes the Commission to "perform any and all acts . . . not inconsistent with this Act, as may be necessary in the execution of its functions."[1741] Given the extraordinary upheaval in the industry's structure set in motion by the 1996 Act, and the specific concerns described above, we believe that a temporary mechanism is necessary in order to ensure that the policy goals underlying the access charge system and the Communications Act itself are not undermined. Further, we believe section 251(g) of the 1996 Act lends support to our decision. As discussed above, section 251(g)

[1739] *See* Regulatory Flexibility Act, 5 U.S.C. §§ 601 *et seq.*

[1740] *See, e.g., New England Tel. and Tel. Co. v. FCC*, 826 F.2d 1101 (D.C. Cir. 1987); *North American Telecommunications Association v. FCC*, 772 F.2d 1282 (7th Cir. 1985); *Lincoln Tel. and Tel. Co. v. FCC*, 659 F.2d 1092 (D.C. Cir. 1981).

[1741] 47 U.S.C. § 4(i).

does not require that incumbent LECs continue to receive access charge revenues when telecommunications carriers use unbundled incumbent LEC network elements to originate and terminate interstate traffic. That section does, however, provide evidence of Congressional recognition of the potential tension between existing interconnection obligations, such as access charges, and the new methods of interconnection mandated by section 251, and therefore supports our decision to create a limited-duration mechanism to address this tension.

727. The decision of the court in *CompTel v. FCC* to remand our decision to adopt the TIC is not inconsistent with this approach. The Court's concern stemmed, in part, from the inclusion of a portion of the interstate tandem switching revenue requirement in the TIC. We have excluded from the charges that purchasers of unbundled local switching must pay a percentage of the TIC that, at a minimum, includes these allocated tandem switching revenues from the transitional charges that incumbent LECs may assess on IXCs.[1742] Furthermore, the Court directed the Commission to develop a cost-based transport rate structure, or to explain why it chose not to do so.[1743] We intend to fulfill this obligation in the forthcoming access reform proceeding. The charge equal to 75 percent of the TIC will be applied only as an interim measure for a brief, clearly-identified period, until that restrucuring of access charges is completed. The court expressly acknowledged that the 1996 Act would have implications for the access charge system.[1744] For the rea-

---

[1742] As discussed above, we estimate that the tandem switching, SS7, and other costs associated with transport facilities now recovered through the TIC likely do not exceed 25% of the TIC for most incumbent LECs.

[1743] *Competitive Telecommunications Association v. FCC*, No. 96-1168 at 26-27.

[1744] *Id.* at 12-13.

sons described above, we conclude that these effects necessitate temporary application of a portion of the TIC to entrants that win end user customers from LECs, and that puchase the local switch as an unbundled element to originate and terminate interstate and intrastate toll traffic for such end users. In the access reform proceeding, we intend to determine the appropriate disposition for these revenues. Until we have had the opportunity to do so, however, we permit incumbent LECs to recover a transitional charge equal to 75 percent of the TIC under the limited circumstances described herein.

728. The interim mechanism we establish here differs from the waiver relief we have previously granted to NYNEX and Ameritech to permit them to recover certain interstate access charge revenues through "bulk billing" of revenues to all interstate switched access customers.[1748] Those orders responded to waiver requests filed prior to the passage of the 1996 Act. Our responsibility in those proceedings was to determine whether special circumstances existed, and whether the specific relief requested better served the public interest than continued application of our general rules. By contrast, the action we take today addresses industry-wide issues that arise from the new regime put into place by section 251 of the 1996 Act, which allows states to establish unbundled network element rates that recover the full unseparated cost of elements. Our response to the Ameritech and NYNEX waiver petitions does not, simply because those petitions also concerned access charge recovery, constrain our decision in this proceeding.

[1748] *See The NYNEX Tel. Cos. Petition for Waiver, Transition Plan to Preserve Universal Service in a Competitive Environment*, Memorandum Opinion and Order, 10 FCC Rcd 7445 (1995), *reconsideration pending* (*NYNEX USPP Order*); *Ameritech Operating Companies Petition for a Declaratory Ruling and Related Waivers to Establish a New Regulatory Model for the Ameritech Region*, Order, FCC 96-58 (released Feb. 15, 1996) (*Ameritech Customers First Order*).

729. It would be unreasonable to provide such a transitional mechanism on the federal level, but to deny similar authority to the states. Therefore, states may continue existing explicit universal service support mechanisms based on intrastate access charges for an interim period of a similar brief, clearly-defined length. During that period, unless decided otherwise by the state, incumbent LECs may continue to recover such revenues from purchasers of unbundled local switching elements that use those elements to originate or terminate intrastate toll calls for end user customers they win from incumbent LECs. States may terminate these mechanisms at any time. We define mechanisms based on intrastate access charges as those mechanisms that require purchasers of intrastate access services from incumbent LECs to pay non-cost-based charges for those access services on the basis of their intrastate access minutes of use.

730. We do not intend, however, that such a transitional mechanism eviscerate the requirements of sections 252 and 254, which, as we have stated, prohibit funding of universal service subsidies through rates for interconnection and unbundled network elements. Mechanisms such as New York's "pay or play" system, which would impose intrastate access charges on non-access services rather than allowing incumbent LECs to recover non-cost-based revenues from purchasers of access services, may not be included in this interim system. Such a result is justified because state "pay or play" mechanisms do not at present constitute a significant revenue stream to incumbent LECs, and therefore elimination of this mechanism is unlikely, in the short term, to have significant detrimental effects on universal service support.

731. These state mechanisms must end on the earlier of: (1) June 30, 1997; or (2) if the incumbent LEC that receives the transitional access charge revenues is a BOC, the date on which that BOC is authorized under

section 271 of the 1996 Act to offer in-region interLATA service. With one exception, the analysis provided above as to the rationale for the end dates for the transitional interstate access charge mechanism applies here as well. Because our access reform proceeding focuses on federal charges, and because the full extent of the section 254 universal service mechanism remains to be determined in that proceeding, intrastate access charge-based universal service support mechanisms should not now be required to terminate upon the completion of those proceedings.

732. As with our decision to permit incumbent LECs to continue to receive certain interstate access charge revenues from some purchasers of unbundled local switching for a limited period of time, we believe our decision to allow states to preserve certain intrastate universal service support mechanisms based on access charges is within our authority under section 251(d)(1) of the 1996 Act, and section 4(i) of the 1934 Act. Moreover, although section 251(g) does not directly refer to intrastate access charge mechanisms, it would be incongruous to conclude that Congress was concerned about the effects of potential disruption to the interstate access charge system, but had no such concerns about the effects on analogous intrastate mechanisms.

(c) Fifth Amendment Issues

733. We conclude that our decision that prices for incumbent LECs' unbundled elements and interconnection offerings be based on forward-looking economic cost does not violate the incumbent LECs' rights under the Fifth Amendment of the Constituton. The Supreme Court has recognized that public utilities owned and operated by private investors, even though their assets are employed in the public interest to provide consumers with service, may assert their rights under the Takings Clause of the

Fifth Amendment.[1746] In applying the Takings Clause to rate setting for public utilities, the Court has stated that "[t]he guiding principle has been that the Constitution protects utilities from being limited to a charge for their property serving the public which is so 'unjust' as to be confiscatory." [1747]

734. The Supreme Court has held that the determination of whether a rate is confiscatory depends on whether that rate is just and reasonable, and not on what methodology is used.[1748] In *Federal Power Comm'n v. Hope Natural Gas Co.*, the Court upheld the Federal Power Commission's order that required the company to make a large reduction in wholesale gas rates. The commission based its determination of a reasonable rate of return on a plant valuation determined by using a historical cost methodology that was only half as large as the company's own valuation based on forward-looking reproduction costs. In its decision, the Court set forth the governing legal standard for determining whether a rate is constitutional:

> Under the statutory standard of "just and reasonable" it is the result reached not the method employed that is controlling. It is not the theory but the impact of the rate order which counts. If the total effect of the rate order cannot be said to be unjust and unreasonable, judicial inquiry under the Act is at an

---

[1746] The Fifth Amendment provides that, "private property [shall not] be taken for public use, without just compensation." U.S. Const. amend. V. *See Duquesne Light Co. v. Barasch*, 488 U.S. 299, 307 (1989) (*Duquesne*).

[1747] *Duquesne*, 488 U.S. at 307 (*citing Covington & Lexington Turnpike Road Co. v. Sandford*, 164 U.S. 578, 597 (1896)).

[1748] *Hope Natural Gas*, 320 U.S. at 602-603; *see also Duquesne; In re Permian Basin Area Rate Cases*, 390 U.S. 747 (1968); *Federal Power Commission v. Memphis Light, Gas & Water Division*, 411 U.S. 458 (1973); *Jersey Central Power & Light v. FERC*, 810 F.2d 1168 (D.C. Cir. 1987).

> end. The fact that the method employed to reach that result may contain infirmities is not then important.[1749]

735. The Court went on to explain that, in determining whether a rate is reasonable, the regulatory body must balance the interests of both the investor and consumer.[1750] "From the investor or company point of view, it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business. . . . [T]he return on the equity owner should be commensurate with returns on investments in other enterprises having corresponding risks." [1751]

736. Under sections 251(c)(2) and (3) of the 1996 Act, incumbent LECs must establish rates for interconnection and unbundled elements that are just and reasonable.[1752] In adopting the rules that govern those rates, under *Hope Natural Gas* we must consider whether the end result of incumbent LEC rates is just and reasonable. Incumbent LECs argue that establishing a rate structure that does not permit recovery of historical or embedded costs is confiscatory. We disagree. As stated above, the Court has consistently held since *Hope Natural Gas* that it is the end result, not the method used to achieve that result, that is the issue to be addressed.[1753] Indeed, the Court has found that the "fixing of prices, like other applications of the police power, may reduce the value of the property which is being regulated. But the fact that the value is reduced does not mean that the regulation is in-

---

[1749] *Hope Natural Gas*, 320 U.S. at 602.

[1750] *Id.*

[1751] *Id.* at 603.

[1752] 47 U.S.C. § 251(c)(2) and (3).

[1753] *See, e.g., Duquesne*, 488 U.S. at 310; *Hope Natural Gas*, 320 U.S. at 602.

valid."[1754] Moreover, the Court has upheld as reasonable changes in ratemaking methodology when the change resulted in the exclusion of historical costs prudently incurred.[1755] Thus, the mere fact that an incumbent LEC may not be able to set rates that will allow it to recover a particular cost incurred in establishing its regulated network does not, in and of itself, result in confiscation.

737. Moreover, *Hope Natural Gas* requires only that the end result of our overall regulatory framework provides LECs a reasonable opportunity to recover a return on their investment. In other words, incumbent LECs' overall rates must be considered, including the revenues for other services under our jurisdiction.[1756]

738. In this proceeding, we are establishing rules that should produce rates for monopoly elements and services that approximate what the incumbent LECs would be able to charge if there were a competitive market for such offerings. We believe that a forward-looking economic cost methodology enables incumbent LECs to recover a fair return on their investment, *i.e.*, just and reasonable rates. The record does not compel a contrary conclusion. No incumbent LEC has provided persuasive evidence that prices based on a forward-looking economic cost methodology would have a significant impact on its "financial integrity." We further note that at least one federal appellate court has held incremental cost-based pricing constitutional.[1757]

739. Incumbent LECs may seek relief from the Commission's pricing methodology if they provide specific

---

[1754] *Hope Natural Gas*, 320 U.S. at 601.

[1755] *Duquesne*, 488 U.S. at 301-302.

[1756] However, we may not consider incumbent LECs' revenue derived from services not under our jurisdiction. *Smith v. Ill. Bell*, 282 U.S. 133 (1930).

[1757] *Metropolitan Transp. Auth. v. Interstate Commerce Commission*, 792 F.2d 287, 297 (2d Cir.), *cert. denied*, 479 U.S. 1017 (1986).

information to show that the pricing methodology, as applied to them, will result in confiscatory rates. We also do not completely foreclose the possibility that incumbent LECs will be afforded an opportunity to recover, to some extent, their embedded costs through a mechanism separate from rates for interconnection and unbundled network elements. As stated above, we intend to explore this issue in detail in our upcoming access reform proceeding.

740. GTE argues that the proper standard to review our ratemaking methodology is the just compensation standard generally reserved for takings of property. This is in effect a contention that the 1996 Act's physical collocation and unbundled network facility requirements constitute physical occupation of their property that should be deemed a taking and that must be subject to "just compensation." Assuming for the sake of argument that the physical collocation and unbundled facilities requirements do result in a taking, we nevertheless find that the ratemaking methodology we have adopted satisfies the just compensation standard. Just compensation is normally measured by the fair market value of the property subject to the taking.[1738] Just compensation is not, however, intended to permit recovery of monopoly rents.[1739] The just and reasonable rate standard of TELRIC plus a reasonable allocation of the joint and common costs of providing network elements that we are adopting attempts to replicate, with respect to bottleneck monopoly elements, the rates

---

[1738] *See, e.g., United States v. Miller*, 317 U.S. 369, 374 (1943) (holding that just compensation can readily be set by ascertaining the property's fair market value, *i.e.*, "what a willing buyer would pay in cash to a willing seller").

[1739] *See, e.g., Lord Mfg. Co. v. United States*, 84 F.Supp. 748, 755-56 (Ct.Cl. 1949), *citing United States v. Cors*, 337 U.S. 325, 334 (1949).

that would be charged in a competitive market,[1760] and, we believe, is entirely consistent with the just compensation standard. Indeed, a similar rate methodology based on incremental costs has been found to satisfy the just compensation requirement.[1761] For these reasons, we conclude that, even if the 1996 Act's physical collocation and unbundled network facility requirements constitute a taking, a forward-looking economic cost methodology satisfies the Constitution's just compensation standard.

* * * *

(3) Discussion

743. We conclude, as a general rule, that incumbent LECs' rates for interconnection and unbundled elements must recover costs in a manner that reflects the way they are incurred. This will conform to the 1996 Act's requirement that rates be cost-based, ensure requesting carriers have the right incentives to construct and use public network facilities efficiently, and prevent incumbent LECs from inefficiently raising costs in order to deter entry. We note that this conclusion should facilitate competition on a reasonable and efficient basis by all firms in the industry by establishing prices for interconnection and unbundled elements based on costs similar to those incurred by the incumbents, which may be expected to reduce the regulatory burdens and economic impact of our decision for many parties, including both small entities seeking to enter the local exchange markets and small incumbent LECs.[1768] We also adopt some more specific rules that follow from this general rule.

C. Default Proxy Ceilings and Ranges

767. As previously discussed, we strongly encourage state commissions, as a general rule, to set arbitrated rates for interconnection and access to unbundled network elements pursuant to the forward-looking, economic cost pricing methodology we adopt in this Order. Such rates would approximate levels charged in a competitive market, would be economically efficient, and would be based on the forward-looking, economic cost of providing interconnection and unbundled elements. We recognize, however, that in some cases, it may not be possible for carries to prepare, or the state commission to review, economic cost studies within the statutory time frame for arbitration and thus here first address situations in which a state has not approved a cost study. States that do not complete their review of a forward-looking economic cost study within the statutory time periods but must render pricing decisions, will be able to establish interim arbitrated rates based on the proxies we provide in this Order. A proxy approach might provide a faster, administratively simpler, and less costly approach to establishing prices on an interim basis than a detailed forward-looking cost study.

768. The default proxies we establish will, in most cases, serve as presumptive ceilings. States may set prices below those ceilings if the record before them supports a lower price. States should provide a reasoned basis for selecting a particular default price. In one case, for local switching, the default proxy is a range within which a state may set prices.

* * * *

2. Proxies for Specific Elements

a. Overview

787. Although we encourage states to use an economic cost methodology to set rates for interconnection, unbundled network elements, and collocation, we will permit

states unable to analyze an economic costing study within the statutory time constraints to use default proxies in setting and reviewing rates. We set forth below the default proxies for specific network elements. These proxies are interim only. They will apply only until a state sets rates in arbitrations on the basis of an economic cost study, or until we promulgate new proxies based on economic cost models.[1866] We also set forth below the rate structure rules that apply to each of network elements. These rate structure requirements are applicable regardless of whether a state uses an economic cost study or the proxy approach to set rate levels.

* * * *

792. We are adopting a proxy ceiling based on two cost models and rates for unbundled loops allowed by six states that had available to them the results of forward-looking economic cost studies at the time they considered either interim or permanent rates for the unbundled loop element. These states are Colorado, Connecticut, Florida, Illinois, Michigan, and Oregon. Each of these states has used a standard that appears to be reasonably close to the forward-looking economic cost methodology that we require to be used, although possibly not consistent in every detail with our TELRIC methodology.[1867] Generally, these

---

[1866] *See infra*, Section VII.C.3., discussing generic cost models.

[1867] *See In re: U S West Communications, Inc. Filing of Advice Letter No. 2610 In Compliance with Commission Decision No. C96-521 Adopting Emergency Rules (Tariff)*, Docket No. 96S-233T, Decision No. C96-655 (Colorado Commission, June 21, 1996) [*"Colorado Decision"*] at 58-64 (interim unbundled loop prices set after review of TSLRIC cost studies); *Re Southern New England Telephone Company*, Order No. 95-06-17, 1995 WL 803837 (Conn. D.P.U.C., December 20, 1995) [*"Connecticut Decision"*] at 9-10, 72 (same); *In re: application of City Signal, Inc., for an order establishing and approving interconnection arrangements with Ameritech Michigan*, Case No. U-10647 (Michigan Commission, February 23, 1995) [*"Michigan Decision"*] at 32, 56-57 (setting interim unbundled loop rates based on estimated TSLRIC costs); *In re: Resolution of petition(s) to establish nondiscriminatory rates, terms and*

states appear to have included an allocation of forward-looking common costs in their unbundled loop prices. The individual state studies resulted in the following average rates for unbundled local loops: Colorado, $18; Connecticut, $12.95; Florida, $17.28; Illinois, $10.93; Michigan, $10.03; and Oregon, $12.45, computed as set forth below.

793. The Colorado Commission set an interim rate of $18 per month for unbundled loops terminated at the main distribution frame of the LEC switch.[1868] The Connecticut Commission ruled that SNET must provide the following interim unbundled loop prices varying by four zones: metro $10.18; urban $11.33; suburban $15.33; and rural $14.97.[1869] In the absence of further information about customer density or average loop length by zone, we used a simple average equal to $12.95. The Florida Commis-

---

conditions for resale involving local exchange companies and alternative local exchange companies and alternative local exchanges companies pursuant to Section 364.161, Florida Statutes, Docket No. 950984-TP, Order No. PSC-96-0444-FOF-TP, (Florida Commission, March 29, 1996) [*"Florida Decision I"*] at 16 (interim unbundled loop prices set with reference to BellSouth cost studies); *In Re: Resolution of petition(s) to establish nondiscriminatory rates, terms and conditions for resale involving local exchange companies and alternative local exchange companies and alternative local exchanges companies pursuant to Section 364.161, Florida Statutes*, Docket No. 950981-TP, Order No. PSC-96-0811-FOF-TP (Florida Commission, June 24, 1996) [*"Florida Decision II"*] at 25-26 (setting rates after review of GTE and United/Centel cost studies); *In re: Investigation into the Cost of Providing Telecommunications Service*, Order No. 96-188, (Oregon Commission, July 19, 1996) [*"Oregon Decision"*] at 78 n.61 (interim unbundled loop prices generally based on LRIC estimates plus applicable group related costs, and an additional contribution for recovery of joint and common costs); *Illinois Bell Telephone Company Proposed introduction of a trial of Ameritech's Customers First Plan in Illinois* Docket Nos. 94-0096/94-0117/94-0146]94-0301 (Illinois Commission, April 7, 1995) [*"Customers* First Order"] at 54, 61 (rates set with reference to Ameritech's LRSIC studies).

[1868] Colorado Decision at 66.

[1869] *Connecticut Decision* at 74.

sion set an interim rate for 2-wire loops at $17.00 per month for BellSouth, $15.00 for United/Centel, and $20.00 for GTE.[1870] Using weights equal to the number of loops served by each company in 1994 as reported in the Monitoring Report,[1871] we computed a weighted average price equal to $17.28. Pursuant to its *Customers First* Order, the Illinois Commerce Commission approved tariffs establishing business rates equal to $7.08, $10.92, and $14.45, and residential rates equal to $4.59, $8.67, and $12.14 in three density zones.[1872] Based on data from Table 2.5, page 20 of the Common Carrier Statistics, 1995 Preliminary, we found a 36 percent–64 percent business residential split. Using Illinois Commission data for number of households in each density zone (996,750 in zone A; 2,788,759 in zone B; 4,594,567 in zone C), we computed an average loop cost of $10.93. The Michigan Commission approved transitional rates of $8.00 per loop for business and $11 per loop for residence.[1873] Based on Common Carrier Statistics, 1995 Preliminary data, we computed a 32 percent–68 percent business-residential split in Michigan, which leads to an average rate of $10.03. The Oregon Commission set the rate for a "basic 2-wire loop set" at $11.95 plus $0.50 for a network access channel connection, for a total price of $12.45.[1874]

794. In order to set a proxy ceiling for unbundled loop elements we make use of the two cost models for which nationwide data are available and upon which parties have had the opportunity to comment in this proceeding. These

[1874] *Oregon Decision* at Appendix C, p.1.

models are the Benchmark Cost Model (*BCM*)[1875] and the *Hatfield 2.2*.[1876] Based on our current information, we believe that both these models are based on detailed engineering and demographic assumptions that vary among states, and that the outputs of these models represent sufficiently reasonable predictions of relative cost differences among states to be used as set forth below to set a proxy ceiling on unbundled loop prices for each state. We do not believe, however, that these model outputs by themselves necessarily represent accurate estimates of the absolute magnitude of loop costs. As we discuss below, further analysis is necessary in order to evaluate fully the procedures and input assumptions that the models use in order to derive cost estimates. Furthermore, in the case of *BCM*, model outputs include costs in addition to the cost of the local loop. In order to correct for these considerations, we have developed a hybrid cost proxy in the following manner. First, we have applied a scaling factor to the cost estimates of each model. This scaling is based on the actual rates computed for unbundled loop elements in the six states referred to above. Specifically we have multiplied the cost estimate produced by each model in each state by a factor equal to the unweighted average of rates adopted by state commissions in the six states, divided by the unweighted average of the model cost estimates for the same six states. Our hybrid cost proxy is computed as the simple average of the scaled cost estimates for the

---

[1875] *Benchmark Cost Model: A Joint Submission by MCI Communications, Inc., NYNEX Corporation, Sprint Corporation, U S West, Inc.* (December 1995), submitted by MCI Communications, Inc., NYNEX Corp., Sprint/United Management Corp., U S West, Inc. on July 24, 1996 (*BCM*). For a more detailed discussion of the *BCM*, *see infra*, Section VII.C.3.

[1876] *Hatfield Model, Version 2.2, Release 1*, (Hatfield Associates, Inc., March 1996), submitted by AT&T and MCI on May 16, 1996 (*Hatfield 2.2*); *see also* AT&T reply at Appendix D (Update of the Hatfield Model Version 2.2, Release 1). *See infra*, Section VII.C.3., for a more detailed discussion of the various versions of the *Hatfield* model.

two models in each of the 48 contiguous states and the District of Columbia. Neither *BCM* nor *Hatfield 2.2* provide cost estimates for Alaska and only the *BCM* provides an estimate for Hawaii. Our default loop cost proxies for Hawaii and Puerto Rico are based on the default loop cost proxies of the states that most closely approximate them in population density per square mile.[1877] We are not setting default loop cost proxies in this Order for Alaska or for any of the remaining non-contiguous areas subject to the 1996 Act requirement that incumbent LECs offer unbundled loop elements. We are not establishing default loop cost proxies for these areas because we are unsure that comparisons of the population densities of the continental states and of Alaska and other non-contiguous areas subject to the 1996 Act fully capture differences in loop costs. Regulatory authorities in those areas may seek assistance from this Commission should default loop cost proxies be needed before they have completed their investigations of the forward-looking costs of providing unbundled loop elements. Since our intention is to establish a ceiling for unbundled loop rates, we believe that it is necessary to take account of the variation in the data that we have used for scaling. While the six states that we considered appear to have based their rates on forward-looking economic cost pricing principles, the actual rates that they approved appear to reflect other factors as well. Furthermore, because only a small number of states have conducted such studies, some upward adjustment is warranted as a safety margin to ensure that the ceiling captures the variation in forward-looking economic costing prices on a state-by-state basis. We have therefore chosen to adjust the hybrid cost estimates upward by five percent

---

[1877] There is a strong (negative) correlation between population density and the loop costs reported by all the cost models. The correlation is significant at the 5% level. Population densities are from The Statistical Abstract of the United States 1995, Table Number 23. For Puerto Rico, land area is from Table 361 and population is from Table 1345.

for each state. A table listing the proxy ceilings on a statewide average basis is contained in Appendix D.

795. A number of parties have opposed the use of either the *Hatfield* model or *BCM*.[1878] Some critics, for example, have argued that the models may lead to inaccurate cost estimates since these estimates assume that a network is built "from scratch."[1879] Others have criticized specific procedures that have been used in the models to estimate both operating expenses and capital costs. As discussed below in Section VII.C.3., we believe that these criticisms may have merit. In a future rulemaking proceeding, we intend to examine in greater detail various forward looking economic cost models. For the purposes of setting an interim proxy, however, we note that the criticisms have been directed largely toward the absolute level of cost estimates produced by the models, rather than the relative cost estimates across states. Since our hybrid proxy ceiling explicitly scales the model cost estimates based on existing state decisions and uses the model results simply to compute relative prices, we believe that these criticism do not apply in the present context.

* * * *

811. Based on the record in this proceeding and in the *LEC-CMRS Interconnection* proceeding, we conclude that a range between 0.2 cents ($0.002) per minute of use and 0.4 cents ($0.004) per minute of use for unbundled local switching is a reasonable default proxy. In setting this default price range, we consider the range of evidence in the record, and believe that the most credible studies fall at the lower end of this range.[1929] However, so as to

---

[1878] For a more detailed discussion of these generic cost models, *see infra*, Section VII.C.3.

minimize disruption for any state that has set a rate only marginally outside this range, we will grandfather any state that has set a rate at 0.5 cents ($0.005) per minute of use or less pending completion of an economic study pursuant to the methodology set forth in this Order.

812. The forward-looking cost studies contained in the record estimate that the average cost of end-office switching ranges from 0.18 cents ($0.0018) per minute of use [1930] to 0.35 cents ($0.0035) per minute of use.[1931] Maryland and Florida have adopted rates based on forward-looking economic cost studies that fall within the default price range we are adopting.[1932] NYNEX's estimate of 0.129 cents ($0.00129) per minute of use, in the Massachusetts proceeding, is estimate an estimate of the marginal cost of end-office switching.[1933] As discussed above, we generally expect studies estimating marginal costs to generate estimates that are less than

estimates derived from TELRIC-based studies. We, therefore, conclude that 0.2 cents ($0.002) per minute of use is a reasonable lower end of the price range for end-office switching.

813. USTA's estimate of 1.3 cents ($0.013) appears to be an outlier that is significantly higher than the other estimates.[1934] We find that USTA's estimate does not represent an appropriate cost model for termination of traffic. USTA's estimate is based on the high end of a set of econometric estimates of LEC-reported cost data rather than an independent cost estimate, and USTA gives no explanation of why we should regard this as the best estimate. In addition, USTA's figure is derived, at least in part, from studies that attempt to measure the incremental cost of end-to-end use of the network for local calls, not the cost of local switching. Pacific Bell's study of the average LRIC of a call terminating under "Feature Group B" [1935] apparently includes terminations at tandem switches in addition to end-office terminations.

814. Michigan and Illinois have adopted rates for transport and termination of traffic that are higher than the default price range we adopt for end-office switching.[1936] Michigan, which established mutual compensation rates of 1.5 cents ($0.015) per minute of use, did not review a forward-looking cost study.[1937] Illinois's 0.5 cents ($0.005)

per minute rate for termination through the end office is just outside the range we are establishing. First, as previously stated, we are grandfathering rates of 0.5 cents ($0.005) per minute or lower. Further, we do not believe Illinois's rate overrides the weight of evidence in the record, which supports the range we are establishing.

* * * *

b. Discussion

838. As noted earlier, we will continue to review our pricing methodology, and will make revisions as appropriate. Accordingly, there is no present need to establish a Commission price cap or cost index system to adjust interconnection and unbundled element rate levels.

* * * *

a. Criteria for Cost Studies

911. There has been considerable debate on the record in this proceeding and before the state commissions on whether section 252(d)(3) embodies an "avoided" cost standard or an "avoidable" cost standard. We find that "the portion [of the retail rate] . . . attributable to costs that will be avoided" includes all of the costs that the LEC incurs in maintaining a retail, as opposed to a wholesale, business. In other words, the avoided costs are those that an incumbent LEC would no longer incur if it were to cease retail operations and instead provide all of its services through resellers. Thus, we reject the arguments of incumbent LECs and others who maintain that the LEC must actually experience a reduction in its operating expenses for a cost to be considered "avoided" for purposes of section 252(d)(3). We do not believe that Congress intended to allow incumbent LECs to sustain artificially high wholesale prices by declining to reduce their expenditures to the degree that certain costs are readily avoidable. We therefore interpret the 1996 Act as requiring states to make an objective assessment of what costs are

reasonably avoidable when a LEC sells its services wholesale. We note that Colorado, Georgia, Illinois, New York, and Ohio commissions have all interpreted the 1996 Act in this manner.[2194]

* * * *

925. We find that we can use MCI's model, with some modifications, along with the results of certain state proceedings, to establish a range of rates that would produce an acceptable default wholesale discount rate that reasonably approximates the amount of avoided costs that should be subtracted from the retail rate. A default rate is to be used only in three instances: (1) in a state arbitration proceeding if an avoided cost study that satisfies the criteria we set forth above does not exist; (2) where a state has not completed its review of such an avoided cost study; (3) where a rate established by a state before the release date of this Order is based on a study that does not comply with the criteria described in the previous section. We emphasize that the default rate is to be used as an interim measure only, and should be replaced with an avoided cost study within a reasonable time. The MCI model is a reasonable attempt at estimating avoided cost in accordance with section 252(d)(3) using only publicly-available data. We find, however, that we should modify certain features of the model.

926. First, MCI treats account 6722 (external relation) and account 6727 (research and development) as avoidable costs. MCI argues that purchasers of wholesale services are competing with LECs and, therefore, should not be forced to fund regulatory activities reflected in account 6722. MCI claims that research and develop-

---

[2194] *See, e.g., U S West Communications, Inc. Filing Advice Letter No. 2610 in Compliance with Commission Decision No. C96-521 Adopting Emergency Rules*, Docket No. 96S-233T (Colorado Commission June 21, 1996) at paras. 12-13; *Petiton of AT&T for the Commission to Establish Resale Rules, Rates, Terms, and Conditions.*

ment are not of practical use for the services that resellers will purchase. As explained above, this type of disallowance is not contemplated by the avoided cost standard of section 252(d)(3). We therefore adjust the model to treat these costs in the same manner as other overhead expense accounts.

927. Second, MCI treats a number of accounts as "other avoided costs" on the grounds that the expenses in those accounts are not relevant to the provision of telecommunications services that an incumbent LEC currently provides.[2204] Public telephone terminal equipment expense and large PBX expense are not "avoided" precisely because they are unrelated to the retail services being discounted. We would not expect these expenses to be included in retail service rates for resold services; but if these expenses were included in retail rates, they would not be avoided when the services are purchased by resellers. The rest of MCI's "other" accounts contain costs that support all of the telecommunications services offered by the company. MCI has not shown that any of these costs are either reduced or eliminated when services are sold at wholesale. We, therefore, adjust the MCI model so as not to treat these accounts as avoidable costs.

928. Third, MCI treats accounts 6611 (product management), 6612 (sales), 6613 (product advertising), and 6623 (customer services) as costs that are entirely avoided with respect to services purchased at wholesale. We agree that a large portion of the expenses in these accounts is avoided when service is sold at wholesale. We also agree, however, with parties that argue that some expenses in

---

[2204] Based on this rationale, MCI excludes account 6113 (aircraft expense), account 6341 (large PBX expense), account 6511 (property held for future telecommunications use expense), account 6351 (public telephone terminal equipment expense), account 6512 (provisioning expense), account 6562 (depreciation expense for property held for future telecommunications use), and account 6564 (amortization expense, intangible).

these accounts will continue to be incurred with respect to wholesale products and customers, and that some new expenses may be incurred in addressing the needs of resellers as customers. No party in this proceeding has suggested a specific adjustment to the MCI model that would account for these costs of the wholesale operation. We note that, in their own proceedings, several states have made varying estimates concerning the level of wholesale-related expenses in these accounts. Colorado, for example, estimated that none of the costs in accounts 6611-6613 would relate to wholesale services, and that only five percent of the costs in account 6623 would be incurred in a wholesale operation.[2205] The Georgia Commission, on the other hand, decided that 25 percent of sales and product advertising expenses would continue to be incurred in the wholesale operation.[2206] Given the lack of evidence, and the wide range of estimates that have been made by these states, we find it reasonable to assume, for purposes of determining a default range of wholesale discount rates, that ten percent of costs in accounts 6611, 6612, 6613, and 6623 are not avoided by selling services at wholesale.

929. Fourth, MCI uses a complex formula to calculate the portions of overhead and general support expense that are attributable to avoided costs. We find that this formula is constructed in a way that tends to inflate the results of

---

[2205] *U S West Communications, Inc. Filing Advice Letter No. 2610 in Compliance with Commission Decision No. C96-521 Adopting Emergency Rules*, Docket No. 96S-233T (Colorado Commission June 21, 1996) at para. 12 and n.20. The Colorado Commission explained that it chose 5 percent because "some small portion of customer services will remain for the interfaces of Operational Support Systems of [U S West] and the resellers, but nowhere near the amount necessary for direct customer contact services." *Id.* n.20.

[2206] *Petition of AT&T for the Commission to Establish Resale Rules, Rates, Terms, and Conditions and Initiate Unbundling of Services*, Docket No. 6352U (Georgia Commission June 21, 1996) at Appendix 1. The Georgia Commission characterized its calculations with respect to sales expense as "conservative at best."

the calculation. We have, therefore, substituted a more straightforward approach in which we apply to each indirect expense category the ratio of avoided direct expense to total expenses. We also identify a slightly different list of accounts representing indirect costs than that proposed by MCI.

930. With the modifications described above, and using actual 1995 data, MCI's model produces the following results for the RBOCs and GTE:

U S West	18.80%
GTE	18.81%
BellSouth	19.20%
Bell Atlantic	19.99%
SBC	20.11%
NYNEX	21.31%
Pacific	23.87%
Ameritech	25.98%

931. We also take into account the experience of those state commissions, Illinois and Georgia, that have undertaken or approved detailed avoided cost studies under the pricing standard of section 252(d)(3) of the 1996 Act. Applying the statutory standard to the examination of significant cost studies, those commissions derived average wholesale discounts of 18.74 percent [2207] and 20.07 percent. We find that these decisions present evidence of an appropriate wholesale discount that should be given more weight than state commission decisions that have set their

---

[2207] Prior to apportioning avoided costs between business and residential services, the Georgia Commission's avoided cost computation would have yielded an aggregate wholesale discount rate of 18.74 percent. This figure is computed by dividing the total avoided costs computed by the Georgia Commission by the total BellSouth residential and business revenues (which were used individually both to apportion total avoided costs between residential and business service and as the denominator in the final wholesale discount calculations).

discounts under other pricing standards or only on an interim basis.[2208]

932. Accordingly, based on the record before us, we establish a range of default discounts of 17-25 percent that is to be used in the absence of an avoided cost study that meets the criteria set forth above. A state commission that has not set wholesale prices based on avoided cost studies that meet the criteria set forth above as of the release date of this Order shall use a default wholesale discount rate between 17 and 25 percent. A state should articulate the basis for selecting a particular discount rate. If this default discount rate is used, the state commission must establish wholesale rates based on avoided cost studies within a reasonable time. The avoided cost study must comply with the criteria for avoided cost studies described above. A state commission may submit an avoided cost study to this Commission for a determination of whether it complies with these criteria. If a party (either a reseller or an incumbent LEC) believes that a state commission has failed to act within a reasonable period of time, that party may file a petition for declaratory ruling with this Commission, asking us to determine whether the state has failed to comply with this rule. We will, in making such determinations, consider the particular circumstances in the state involved. If a state commission has adopted as of the release date of this Order an interim wholesale pricing decision that relies on an avoided cost study that meets the criteria set forth above,

---

[2208] *See, e.g., Order Instituting Rulemaking on the Commission's Own Motion into Competition for Local Exchange Service*, R. 95-04-043 and I. 95-04-044 (California Commission April 26, 1996); *U S West Communications, Inc. Filing Advice Letter No. 2610 in Compliance with Commission Decision No. C96-521 Adopting Emergency Rules*, Docket No. 96S-233T (Colorado Commission June 21, 1996); *Wholesale Rates for Telecommunications Services Ruling on AT&T's Petiton for a Reduction on the Wholesale Rates of Bell Atlantic—Maryland, Inc.*, Case No. 8721 (Maryland Commission June 27, 1996).

the state commission may continue to require an incumbent LEC to offer services for resale under such interim wholesale prices in lieu of the default discount range, so long as the state commission's interim pricing rules are fully enforceable by resellers and followed by a final decision within a reasonable period of time that adopts an avoided cost study that meets the criteria set forth above.

* * * *

984. Although incumbent LECs may continue to recover the SLC when other carriers resell their local exchange services, the SLC is not subject to the wholesale pricing standard of section 252(d)(3). As described above, resellers of local exchange service are not reselling access services; they are purchasing these services from incumbent LECs in the same manner they do today. The SLC is a component of interstate access charges, not of intrastate local service rates. Consistent with the principles of cost-causation and economic efficiency, we have required the portion of interstate allocated loop costs represented by the SLC to be recovered from end users, rather than from carriers as with other access charges. Although the SLC is listed on end user monthly local service bills, this charge does not represent a "telecommunications service [an incumbent LEC] provides at retail to subscribers." Rather, the SLC, like other interstate access charges, relates solely to incumbent LEC interstate access services, which are provided to other carriers rather than retail subscribers and which we have concluded are not subject to the resale requirements of section 251(c)(4). Therefore, the reseller shall pay the SLC to the incumbent LEC for each subscriber taking resold service. The specific SLC that applies depends upon the identity of the end user served by the reselling telecommunications carrier.

* * * *

1023. Sections 251, 252, 332 and 201 are designed to achieve the common goal of establishing interconnection

and ensuring interconnection on terms and conditions that are just, reasonable, and fair. It is consistent with the broad authority of these provisions to hold that we may apply sections 251 and 252 to LEC-CMRS interconnection. By opting to proceed under sections 251 and 252, we are not finding that section 332 jurisdiction over interconnection has been repealed by implication, or rejecting it as an alternative basis for jurisdiction. We acknowledge that section 332 in tandem with section 201 is a basis for jurisdiction over LEC-CMRS interconnection; we simply decline to define the precise extent of that jurisdiction at this time.

1024. As a practical matter, sections 251 and 252 create a time-limited negotiation and arbitration process to ensure that interconnection agreements will be reached between incumbent LECs and telecommunications carriers, including CMRS providers. We expect that our establishment of pricing methodologies and default proxies which may be used as interim rates will help expedite the parties' negotiations and drive voluntary CMRS-LEC interconnection agreements. We also believe that sections 251 and 252 will foster regulatory parity in that these provisions establish a uniform regulatory scheme governing interconnection between incumbent LECs and all requesting carriers, including CMRS providers. Thus, we believe that sections 251 and 252 will facilitate consistent resolution of interconnection issues for CMRS providers and other carriers requesting interconnection.

1025. Although we are applying sections 251 and 252 to LEC-CMRS interconnection at this time, we preserve the option to revisit this determination in the future. We note that Section 332 generally precludes states from rate and entry regulation of CMRS providers, and thus, differentiates CMRS providers from other carriers.[2430] We

---

[2430] In passing section 332 in 1993, Congress stated that it intended to "foster the growth and development of mobile services that, by their nature, operate without regard to state lines as an

also recognize that, based on the combined record in CC Docket No. 95-185 and CC Docket No. 96-68, there have been instances in which state commissions have treated CMRS providers in a discriminatory manner with respect to the terms and conditions of interconnection.[2481] Should the Commission determine that the regulatory scheme established by sections 251 and 252 does not sufficiently address the problems encountered by CMRS providers in obtaining interconnection on terms and conditions that are just, reasonable and nondiscriminatory, the Commission may revisit its determination not to invoke jurisdiction under section 332 to regulate LEC-CMRS interconnection rates.

* * * *

5. Bill and Keep

a. Background

1096. *Local Competition NPRM.* In the NPRM, we defined bill-and-keep arrangements as those in which neither of two interconnecting networks charges the other network for terminating traffic that originated on the other network.[2636] Instead, each network recovers from its own end users the cost of both originating traffic delivered to the other network and terminating traffic received from the other network. A bill-and-approach for termination of traffic does not, however, preclude a positive flat-rated charge for transport of traffic between carriers' networks.

* * * *

1112. Section 252(d)(2)(A)(i) provides that to be just and reasonable, reciprocal compensation must "provide for the mutual and reciprocal recovery by each carrier of costs associated with transport and termination." [2715]

---

integral part of the national telecommunications infrastructure." H.R. Report No. 103-11, 103d. Cong., 1st Sess. 260 (1993).

[2481] *See supra*, Section VII.D.

[2636] NPRM at para. 239.

[2715] 47 U.S.C. § 252(d)(2)(A)(i).

In general, we find that carriers incur costs in terminating traffic that are not *de minimis,* and consequently, bill-and-keep arrangements that lack any provisions for compensation do not provide for recovery of costs. In addition, as long as the cost of terminating traffic is positive, bill-and-keep arrangements are not economically efficient because they distort carriers' incentives, encouraging them to overuse competing carries' termination facilities by seeking customers that primarily originate traffic. On the other hand, when states impose symmetrical rates for the termination of traffic,[2716] payments from one carrier to the other can be expected to be offset by payments in the opposite direction when traffic from one network to the other is approximately balanced with the traffic flowing in the opposite direction. In such circumstances, bill-and-keep arrangements may minimize administrative burdens and transaction costs. We find that, in certain circumstances, the advantages of bill-and-keep arrangements outweigh the disadvantages, but no party has convincingly explained why, in such circumstances, parties themselves would not agree to bill-and-keep arrangements. We are mindful, however, that negotiations may fail for a variety of reasons. We conclude, therefore, that states may impose bill-and-keep arrangements if traffic is roughly balanced in the two directions and neither carrier has rebutted the presumption of symmetrical rates.

* * * *

XII. EXEMPTIONS, SUSPENSIONS, AND MODIFICATIONS OF SECTION 251 REQUIREMENTS

A. Background

1249. Section 251(f)(1) grants rural telephone companies an exemption from section 251(c), until the rural telephone company has received a bona fide request for

---

[2716] *See infra,* Section XI.A.4. for a discusison of symmetrical rates.

interconnection, services, or network elements, and the state commission determines that the exemption should be terminated.[3060] Section 251(f)(2) allows LECs with fewer than two percent of the nation's subscriber lines to petition a state commission for a suspension or modification of any requirements of sections 251(b) and (c). Section 251(f) imposes a duty on state commissions to make determinations under this section, and establishes the criteria and procedures for the state commissions to follow. In the NPRM, we tentatively concluded that state commissions have the sole authority to make determinations under section 251(f). In addition, we sought comment on whether we should issue guidelines to assist state commissions when they make determinations regarding exemptions, suspensions, or modifications under section 251(f).

1250. Although subsections (f)(1) and (f)(2) both address the circumstances under which an incumbent LEC could be relieved of duties otherwise imposed by section 251, subsection 251(f)(2) also applies to non-incumbent LECs. The standard for determining whether to exempt a carrier under subsection 251(f)(1) is different from the standard for determining whether to grant a suspension or modification under subsection (f)(2). Subsection 251(f)(1)(B) requires state commissions to determine that terminating a rural exemption is consistent with the universal

---

[3060] A rural telephone company is defined as a local exchange carrier operating entity to the extent that such entity "(A) provides common carrier service to any local exchange carrier study area that does not include either— (i) any incorporated place of 10,000 inhabitants or more, or any part thereof . . .; or (ii) any territory, incorporated or unincorporated, included in an urbanized area . . .; (B) provides telephone exchange service, including exchange access, to fewer than 50,000 access lines; (C) provides telephone exchange service to any local exchange carrier study area with fewer than 100,000 access lines; or (D) has less than 15 percent of its access lines in communities of more than 50,000 on the date of enactment of the Telecommunications Act of 1996." 47 U.S.C. § 153(37).

service provisions of the 1996 Act.[3061] Subsection 251(f)(2)(A)(i) requires state commissions to grant a suspension or modification if it is necessary to "avoid a significant adverse economic impact on users of telecommunications services generally," and subsection 251(f)(2)(B) requires a suspension or modification to be "consistent with the public interest, convenience, and necessity."[3062] Although we address these two subsections together, we highlight instances in which we believe that differences in statutory language require different treatment by state commissions.

1251. We discuss below issues raised by the commenters, and establish some rules regarding the requirements of section 251(f) that we believe will assist state commissions as they carry out their duties under section 251(f). For the most part, however, we expect that states will interpret the requirements of section 251(f) through rulemaking and adjudicative proceedings. We may in the future initiate a Notice of Proposed Rulemaking on certain additional issues raised by section 251(f) if it appears that further action by the Commission is warranted.

B. Need for National Rules

1. Comments

1252. Most state commissions[3063] and some other

[3061] The provision states, "the State commission shall terminate the exemption if the request . . . is consistent with section 254 (other than subsections (b)(7) and (c)(1)(D) thereof)." 47 U.S.C. § 251(f)(1)(B).

[3062] 47 U.S.C. § 251(f)(2).

[3063] *See, e.g.*, Alaska Commission comments at 6; Alabama Commission comments at 33-34; California Commission comments at 46; Idaho Commission comments at 14; Illinois Commisison comments at 84; Louisiana Commission comments at 22-23; Ohio Commission comments at 80; Oregon Commission comments at 31; Pennsylvania Commission comments at 42; Texas Commission comments at 34; Wyoming Commission comments at 38-39.

parties [3064] assert that states should have exclusive responsibility for the guidelines and determinations made under this section. Several commenters contend that any guidelines the Commission might issue would be useless, because generalized national guidelines could not take into account the variations among states and among individual LECs.[3065] For example, the Minnesota Independent Coalition argues that the additional grant of authority to states under section 214(e) confirms that state commissions have the sole authority to make determinations under section 251(f).[3066] A number of small telephone companies and associations of LECs advocate mandatory national rules regarding implementation of section 251(f). They assert that such rules would ensure that states carry out this provision in accordance with congressional intent.[3067] Some commenters favor a middle ground, claiming that non-mandatory guidelines from the Commission would be helpful, but that mandatory requirements would conflict with the Act's delegation to the states to make determinations under section 251(f).[3068]

[3068] Kentucky Commission comments at 7; Anchorage Tel. Utility comments at 4. Several parties argue that any federal action should not be mandatory. Ohio Commission comments at 80; Citizens Utilities comments at 33; Colorado Ind. Tel. Ass'n comments at 6; Rural Tel. Coalition reply at 18-19.

2. Discussion

1253. We agree with parties, including small incumbent LECs, who argue that determining whether a telephone company is entitled, pursuant to section 251(f), to exemption, suspension, or modification of the requirements of section 251 generally should be left to state commissions.[3069] Requests made pursuant to section 251(f) seek to carve out exceptions to application of the section 251 rules that we are establishing in this proceeding. We find that Congress intended the section 251 requirements, and the Commission's implementing rules thereunder, to apply to all carriers throughout the country, except in the circumstances delineated in the statute. We find convincing assertions that it would be an overwhelming task at this time for the Commission to try to anticipate and establish national rules for determining when our generally-applicable rules should *not* be imposed upon carriers. Therefore, we establish in this Order a very limited set of rules that will assist states in their application of the provisions in section 251(f).

1254. Many parties have proposed varying interpretations of the provisions in section 251(f), and have asked for Commission determination or a statement of agreement. Because it appears that many parties welcome some guidance from the Commission, we briefly set forth our interpretation of certain provisions of section 251(f). Such statements will assist parties and, in particular, state commissions that must make determinations regarding requests for exemption, suspension, and modification.

* * * *

3. Discussion

1262. Congress generally intended the requirements in section 251 to apply to carriers across the country, but Congress recognized that in some cases, it might be unfair

---

[3069] *See, e.g.*, Minnesota Ind. Coalition comments at 14; Rural Tel. Coalition comments at 11.

or inappropriate to apply all of the requirements to smaller or rural telephone companies.[3103] We believe that Congress intended exemption, suspension, or modification of the section 251 requirements to be the exception rather than the rule, and to apply only to the extent, and for the period of time, that policy considerations justify such exemption, suspension, or modification. We believe that Congress did not intend to insulate smaller or rural LECs from competition, and thereby prevent subscribers in those communities from obtaining the benefits of competitive local exchange service. Thus, we believe that, in order to justify continued exemption once a bona fide request has been made, or to justify suspension, or modification of the Commission's section 251 requirements, a LEC must offer evidence that application of those requirements would be likely to cause undue economic burdens beyond the economic burdens typically associated with efficient competitive entry. State commissions will need to decide on a case-by-case basis whether such a showing has been made.

1263. Given the pro-competitive focus of the 1996 Act, we find that rural LECs must prove to the state commission that they should continue to be exempt pursuant to section 251(f)(1) from requirements of section 251(c), once a bona-fide request has been made, and that smaller companies must prove to the state commission, pursuant to section 251(f)(2), that a suspension or modification of requirements of sections 251(b) or (c) should be granted. We conclude that it is appropriate to place the burden of proof on the party seeking relief from otherwise applicable requirements. Moreover, the party seeking exemption, suspension, or modification is in control of the relevant information necessary for the state to make a determination regarding the request. A rural company that falls within section 251(f)(1) is not required to make any showing until it receives a bona fide request for interconnection, services, or network elements. We decline at

---

[3103] 47 U.S.C. § 251(f).

this time to establish guidelines regarding what constitutes a bona fide request. We also decline in this Report and Order to adopt national rules or guidelines regarding other aspects of section 251(f). For example, we will not rule in this proceeding on the universal service duties of requesting carriers that seek to compete with rural LECs. We may offer guidance on these matters at a later date, if we believe it is necessary and appropriate.

1264. We find that Congress intended section 251(f)(2) only to apply to companies that, at the holding company level, have fewer than two percent of subscriber lines nationwide. This is consistent with the fact that the standard is based on the percent of subscriber lines that a carrier has *"in the aggregate nationwide."*[3104] Moreover, any other interpretation would permit almost any company, including Bell Atlantic, Ameritech, and GTE affiliates, to take advantage of the suspension and modification provisions in section 251(f)(2). Such a conclusion would render the two percent limitation virtually meaningless.

1265. We note that some parties recommend that, in adopting rules pursuant to section 251, the Commission provide different treatment or impose different obligations on smaller or rural carriers.[3105] We conclude that section 251(f) adequately provides for varying treatment for smaller or rural LECs where such variances are justified in particular instances. We conclude that there is no basis in the record for adopting other special rules, or limiting the application of our rules to smaller or rural LECs.

* * * *

1291. Requirements set forth in section 252(c) for arbitrated agreements would apply to arbitration conducted by the Commission. We see no reason, and no

---

[3104] 47 U.S.C. § 251(f)(2) (emphasis added).

[3105] For example, the Rural Tel. Coalition argues that interconnection and collocation points should be set in a flexible manner to take into account size and volume differences among carriers. Rural Tel. Coalition comments at 31.

party has suggested a policy or legal basis, for not applying such standards when the Commission conducts arbitration. Thus, arbitrated agreements must: (1) meet the requirements of section 251, including regulations prescribed by the Commission pursuant to section 251; (2) establish any rates for interconnection, services, or network elements according to section 252(d); and (3) provide a schedule for implementation of the terms and conditions by the parties to the agreement.[3160] We reject the suggestion made by some parties that, if the Commission steps into the state commission role, it is bound by state laws and standards that would have applied to the state commission. While states are permitted to establish and enforce other requirements, these are not binding standards for arbitrated agreements under section 252(c). Moreover, the resources and time potentially needed to review adequately and interpret the different laws and standards of each state render this suggestion untenable. Finally, we conclude that it would not make sense to apply to the Commission the timing requirements that section 252(b)(4)(c) imposes on state commissions. The Commission, in some instances, might not even assume jurisdiction until nine months (or more) have lapsed since a section 251 request was initiated.

* * * *

3. Discussion

1309. We conclude that it will assist the carriers in determining their respective obligations, facilitate the development of a single, uniform legal interpretation of the Act's requirements and promote a procompetitive, national policy framework to adopt national standards to implement section 252(i). Issues such as whether section 252(i) allows requesting telecommunications carriers to choose among provisions of prior interconnection agree-

---

[3160] 47 U.S.C. § 252(e).

ments or requires them to accept an entire agreement are issues of law that should not vary from state to state and are also central to the statutory scheme and to the emergence of competition. National standards will help state commissions and parties to expedite the resolution of disputes under section 252(i).

* * * *

1311. We disagree with BellSouth regarding the significance of the legislative history quoted in the NPRM. The Conference Committee amended section 251(g), S. 652's predecessor to section 252(i), and changed "service, facility, or function" to "interconnection, service, or element." The House of Representatives' bill did not contain a version of section 252(i).[8206] We find that section 252 (i)'s language does not differ substantively from the text of the Senate bill's section 251(g). The Senate Commerce Committee stated its provision, section 251(g), was intended to "make interconnection more efficient by making available to other carriers the individual elements of agreements that have been previously negotiated."[8207]

* * * *

1317. We find that section 252(i) permits differential treatment based on the LEC's cost of serving a carrier. We further observe that section 252(d)(1) requires that unbundled element rates be cost-based, and sections 251 (c)(2) and (c)(3) require incumbent LECs to provide only technically-feasible forms of interconnection and access to unbundled elements, while section 252(i) mandates that the availability of publicly-filed agreements be limited to carriers willing to accept the same terms and

---

[8206] Although H.R. 1555's section 244(d) contained similar ideas, its language and structure are sufficiently different from that of section 252(i) that we do not consider section 244(d) to be a prior version of section 252(i).

[8207] *Report of the Committee on Commerce, Science, and Transportation on S. 652*, S. Rpt. 104-23, 104th Cong., 1st Sess. (1995) at 21-22.

conditions as the carrier who negotiated the original agreement with the incumbent LEC. We conclude that these provisions, read together, require that publicly-filed agreements be made available only to carriers who cause the incumbent LEC to incur no greater costs than the carrier who originally negotiated the agreement, so as to result in an interconnection arrangement that is both cost-based and technically feasible. However, as discussed in Section VII regarding discrimination, where an incumbent LEC proposes to treat one carrier differently than another, the incumbent LEC must prove to the state commission that that differential treatment is justified based on the cost to the LEC of providing that element to the carrier.

* * * *

XVI. ORDERING CLAUSES

1442. Accordingly, IT IS ORDERED that, pursuant to Sections 1-4, 201-205, 214, 224, 251, 252, and 303(r) of the Communications Act of 1934, as amended, and Section 601 of the Telecommunications Act of 1996, 47 U.S.C. §§ 151-154, 201-205, 224, 251, 252, 303(r) and 601, the REPORT AND ORDER IS ADOPTED, effective 30 days after publication of a summary in the Federal Register. The collections of information contained within are contingent upon approval by the Office of Management and Budget.

5. With respect to toll service, we further find that section 251(b)(3) requires, at a minimum, that customers be entitled to choose different presubscribed, or preselected, carriers for both their intraLATA and interLATA toll calls. In states, like Alaska and Hawaii, that have no LATAs,[14] customers must be able to choose different presubscribed carriers for both their intrastate and interstate toll calls. Based on this finding, we adopt a rule requiring all LECs to implement intraLATA and interLATA toll dialing parity, using the "full 2-PIC" presubscription method.[15] The toll dialing parity requirement we adopt is

---

[14] 47 U.S.C. § 153(25). According to the 1996 Act, a LATA is a "local access and transport area." It is a "contiguous geographic area—

(A) established before the date of enactment of the Telecommunications Act of 1996 by a Bell operating company such that no exchange area includes points within more than 1 metropolitan statistical area, consolidated metropolitan statistical area, or State, except as expressly permitted under the AT&T Consent Decree; or

(B) established or modified by a Bell operating company after such date of enactment and approved by the Commission."

[15] We note that the abbreviation "PIC" in the past has stood for the term "primary," or "preferred, interexchange carrier." While we retain the acronym "PIC," we define the term to include any

defined by LATA boundaries given that the Bell Operating Companies' (BOCs') operations are likely to be shaped by LATA boundary restrictions for a period of unforeseeable duration. Given that implementation of the 1996 Act over time may diminish the significance of LATA boundaries, however, we permit states to redefine the toll dialing parity requirement based on state, rather than LATA, boundaries where a state deems such a requirement to be procompetitive and otherwise in the public interest.[16]

* * * *

b. Discussion

25. We conclude that the purpose of the statutory dialing parity requirements—to facilitate the introduction of competition in the local and toll markets—is best served by the adoption of broad guidelines and minimum federal standards that build upon the states' experiences. We conclude that such minimum nationwide standards will facilitate competition to the extent that new entrants seeking to offer regional or national services will not be subjected to an array of differing state standards and timetables.[39]

---

toll carrier for purposes of the presubscription rules that we adopt in this *Order*. For a discussion of the full 2-PIC presubscription methodology, *see infra* section II.B(4).

[16] To illustrate, if the presubscription requirement were based on LATA boundaries, a customer would be entitled to choose a primary carrier for all intraLATA toll calls and a separate, or the same, primary carrier for all interLATA toll calls. If the presubscription requirement were based on state boundaries, a customer would be entitled to choose a primary carrier for all intrastate toll calls and a separate, or the same, primary carrier for all interstate toll calls.

[39] We note that section 271(e)(2)(B) precludes most states from requiring a BOC to implement intraLATA toll dialing parity in a state before the BOC has received authority to provide in-region, interLATA services in such state or before three years after enactment of the 1996 Act, whichever is earlier. 47 U.S.C. § 271(e)(2)(B).

We note that our conclusion to adopt nationwide dialing parity standards is consistent with our conclusion in the *First Report and Order* that nationwide standards to implement other section 251 provisions are necessary to facilitate competition by serving as a backdrop against which interconnection negotiations and arbitration can occur.[40] We are persuaded that, contrary to the views of Bell Atlantic, the failure to adopt minimum federal standards would harm both new entrants and consumers by delaying the introduction of competition and imposing additional costs on competitors, including small entities, particularly when different network configurations are required in each market. We conclude that uniform standards—in some cases minimum, uniform standards—will speed competitive entry by more promptly opening the local and toll markets to competition.

* * * *

c. Discussion

29. We adopt our tentative conclusion that section 251(b)(3) creates a duty to provide dialing parity to competing providers of telephone exchange service and telephone toll service with respect to all telecommunications services that require dialing to route a call, and encompasses international as well as interstate and intrastate, local and toll services.[54] We note that section 251(b)(3) does not limit the types of traffic or services for which dialing parity must be provided to competing providers of telephone exchange and telephone toll service. The reference to these types of providers clearly shows that dialing parity must be provided for exchange service and toll service. Nothing in the statutory language limits the scope of the dialing parity obligation to exchange and toll services or distinguishes among the various types of telecommuni-

---

40 See *First Report and Order* at section II.

54 *NPRM* at para. 206.

cations services in imposing the dialing parity obligations. This conclusion is further supported by the statutory definition of dialing parity insofar as it refers to the provision of "telecommunications services" generally without distinction among various types of telecommunications services.[55] In addition, we are not persuaded that section 251(g) relieves certain LECs of the duty to provide toll dialing parity. That section contains no reference or cross reference to dialing parity or to section 251(b)(3). Section 251(g) preserves the equal access obligations already imposed on the BOCs and GTE, but does not exempt them or other LECs from the toll dialing parity requirements. Finally, we note that CMRS providers are not required to provide dialing parity or nondiscriminatory access under section 251(b)(3) because the Commission has not determined that CMRS providers are LECs and section 332(c) of the Communications Act of 1934 provides that a "person engaged in the provision of commercial mobile services . . . shall not be required to provide equal access to common carriers for the provision of toll services."[56]

* * * *

c. Discussion

37. With respect to toll service, we conclude that section 251(b)(3) requires, at a minimum, that customers be entitled to choose presubscribed carriers for their intraLATA and interLATA toll calls. Because of the variations that exist among LATA boundaries and toll traffic within, and among, the various states, we have also concluded that each state should have the opportunity to determine whether customers should be able to presubscribe to carriers for intrastate toll service and for inter-

---

[55] The issue of whether a separate presubscription choice is required for international, interstate, and intrastate toll calls is discussed more fully in section II.B(2) *infra*.

[56] 47 U.S.C. § 332(c)(8).

state toll service in lieu of the intraLATA and interLATA toll presubscription dichotomy that we have established as a minimum nationwide standard at this time. Although toll dialing parity typically has been based on LATA boundaries in multi-LATA states where it has been implemented, we do not impose a requirement that toll dialing parity be based only on LATA boundaries given our expectation that implementation of the 1996 Act eventually will diminish the significance of LATA boundaries.[80] We are aware that BOCs remain subject to certain LATA boundary restrictions for at least the near-term and that some BOCs may find it technically infeasible, or otherwise undesirable, to implement toll dialing parity based on state boundaries.[81] We thus conclude that states should be able to take the relevance of those factors into account, where applicable, and have the flexibility to require that toll dialing parity implementation be based on state boundaries where they determine that implementing toll dialing parity on the basis of state boundaries would be pro-competitive and otherwise in the public interest. In Alaska and Hawaii, states with no LATAs, toll dialing parity will continue to be based on state boundaries.

38. We also direct each LEC to submit to the state regulatory commission for each state in which it provides telephone exchange service the LEC's plan for implement-

---

[80] USTA correctly notes that independent exchange carriers have not been subject to the interLATA line of business restrictions that were imposed on the BOCs pursuant to the AT&T Consent Decree. *See United States v. American Telephone and Telegraph Co.*, 552 F. Supp. 226 (D.D.C. 1982). *See* USTA comments at 3 n.2.

[81] For example, where BOCs receive authority to provide in-region, interLATA services, they are required to provide such services through a separate affiliate for at least three years pursuant to section 272 of the 1996 Act. *See* 47 U.S.C. §§ 272(a)(2), (f)(1). Accordingly, it appears that the LATA distinction will remain relevant insofar as it will continue to define the geographic areas in which a BOC must provide toll services through an affiliate and those in which it may provide toll services directly.

ing toll dialing parity. That plan must contain detailed implementation information, including the proposed date for dialing parity implementation for that exchange that the LEC operates in each state, and the method it proposes for enabling customers to select alternative providers of telephone toll service. For a LEC, other than a BOC, the plan also must identify the LATA with which the LEC proposes to associate.[82]

* * * *

c. Discussion

49. We adopt in this *Order* the full 2-PIC method as the minimum presubscription standard. Under our rules and pursuant to section 251(d)(3),[102] however, state commissions may impose more stringent presubscription requirements, such as multi-PIC or smart-PIC.

* * * *

2. Discussion

59. As discussed above, we require all LECs to provide intraLATA and interLATA toll dialing parity no later than February 8, 1999. In addition, we require a LEC, including a BOC, to provide toll dialing parity throughout a state based on LATA boundaries coincident with its provision of in-region, interLATA or in-region, interstate toll services in that state. As discussed below, for non-BOC LECs that currently are providing, or within a year of release of this *Order* begin to provide, in-region, interLATA or in-region, interstate toll service, we provide a grace period during which those LECs will be able to provide such toll service before having to provide toll dialing parity to their customers. Moreover, non-BOC LECs that implement intraLATA and interLATA toll dialing parity

[82] States may require a LEC to provide other categories of information in its plan in addition to the information categories stated here.

[102] 47 U.S.C. § 251(d)(3).

may choose whichever LATA within their state that they deem to be most appropriate to define the area within which they will offer intraLATA toll dialing parity. State commissions in ruling upon such a choice of LATA association shall determine whether the proposed LATA association is pro-competitive and otherwise in the public interest. We note, however, as discussed above, that states may redefine the toll dialing parity requirement based on state, rather than LATA, boundaries where a state deems such a requirement to be pro-competitive and otherwise in the public interest.

* * * *

D. Implementation of the Local Dialing Parity Requirements

1. In General

a. Background

64. The *NPRM* tentatively concluded that, pursuant to section 251(b)(3), a LEC is required to permit telephone exchange service customers within a defined local calling area to dial the same number of digits to make a local telephone call, notwithstanding the identity of a customer's or the called party's local telephone service provider.[140] The *NPRM* sought comment on this tentative conclusion.[141]

b. Comments

65. Nearly all parties concur with the Commission's proposed interpretation of the local dialing parity requirements of section 251(b)(3).[142] Ameritech contends, however, that the 1996 Act requires only that local calls between competing LECs be dialed without the use of an

---

140 *NPRM* at para. 211.

141 *Id.*

142 *See, e.g.*, ALTS comments at 4; GTE comments at 8; Ohio Commission comments at 8.

access code.[143] Ameritech states that, while the Senate version of the dialing parity provision would have required LECs to provide customers with the ability "to dial the same number of digits" when using any carrier providing telephone exchange and exchange access service in the same area, Congress narrowed the dialing parity obligation in the final legislation to require only that calls between competing LECs be dialed without the use of an access code.[144] In response to Ameritech's proposed interpretation of the local dialing parity requirements, the Ohio Consumers' Counsel asserts that it does "not believe that consumers would see any real functional difference between having to dial extra digits and having to dial an access code" and, thus, urges that customers not be required to dial access codes or extra digits when using a competing provider's services.[145]

66. Ameritech also asks the Commission to clarify that "the dialing parity obligation applies only to competing carriers that provide both telephone exchange service *and* telephone toll service (*i.e.*, competing LECs)."[146] Finally, USTA urges the Commission to clarify that section 251 (b)(3) does not include an obligation to provide dialing parity to CMRS providers.[147] USTA contends that the provision of dialing parity to CMRS providers by LECs would complicate implementation of "sender pays" arrangements that have been adopted in certain states if dialing parity were interpreted to preclude the use of extra

---

143 Ameritech comments at 3-4. Notwithstanding its interpretation of the local dialing parity requirements, Ameritech notes that it has exceeded these requirements by establishing interconnection arrangements that allow customers of competing LECs to complete calls by dialing the same number of digits. *Id.* at 4.

144 *Id.*

145 Ohio Consumers' Counsel reply at 2.

146 Ameritech comments at 3 n.6 (emphasis in original).

147 USTA comments at 5.

digits and/or recorded announcements associated with a "sender pays" arrangement.[148] USTA expesses concern that customers may receive bills for calling CMRS customers without advance notice that they are going to be billed for such calls.[149]

c. Discussion

67. We adopt our tentative conclusion that, pursuant to section 251(b)(3), a LEC is required to permit telephone exchange service customers within a defined local calling area to dial the same number of digits to make a local telephone call, notwithstanding the identity of a customer's or the called party's local telephone service provider. As we stated in the *NPRM*, we believe that this interpretation of the dialing parity requirement as applied to the provision of telephone exchange service would best facilitate the introduction of competition in local markets by ensuring that customers of competitive service providers are not required to dial additional access codes or personal identification numbers in order to make local telephone calls. We disagree with Ameritech's view that Congress intended only to preclude the use of access codes and did not intend to preclude the dialing of extra digits. The fact that Congress ultimately adopted a dialing parity definition that precludes "the use of any access code" [150] does not constrain the Commission from precluding the dialing of extra digits, including access codes. Given that

---

148 *Id.* In this context, the term "sender pays" refers to an arrangement under which a customer who originates a call to a CMRS customer pays the cost of airtime for terminating the call. Under a sender pays arrangement, the customer typically receives information regarding the price of the call before the call is placed. Once the customer receives this information, the customer then may decide whether or not to complete the call. Sender pays arrangements are atypical insofar as it is the CMRS customer who generally pays the cost of airtime for terminating calls.

149 *Id.*

150 47 U.S.C. § 153(15).

the statute does not define the term "access code," we conclude that our interpretation of the local dialing parity requirement will avoid potential disputes concerning what is and what is not an "access code." We are also persuaded by the argument advanced by the Ohio Consumers' Counsel that consumers would not perceive a functional difference between having to dial extra digits and having to dial an access code when using a competing provider's services.

68. We conclude that Ameritech's additional argument that the dialing parity obligation applies only to competing carriers that provide both telephone exchange service *and* telephone toll service, represents an impermissibly narrow reading of the statute. We find that the phrase "providers of telephone exchange service and telephone toll service" imposes an obligation on LECs to provide dialing parity to providers of solely telephone exchange service, to providers of solely telephone toll service, or to providers of both telephone toll and exchange service. We believe that this interpretation is consistent with both the language of the statute and Congress' intent to encourage the entry of new competitors in both the local and toll markets.[151] We reject USTA's argument that the section 251(b)(3) dialing parity requirements do not include an obligation to provide dialing parity to CMRS providers.[152] To the extent that a CMRS provider offers telephone exchange serv-

---

[151] As the U.S. Court of Appeals for the Fifth Circuit stated in *Peacock v. Lubbock Compress Company*, "the word 'and' is not a word with a single meaning, for chameleonlike, it takes its color from its surroundings." The court held that "[i]n the construction of statutes, it is the duty of the Court to ascertain the clear intention of the legislature. In order to do this, Courts are often compelled to construe 'or' as meaning 'and,' and again 'and' as meaning 'or'." *Peacock v. Lubbock Compress Company*, 252 F.2d 892, 893 (5th Cir. 1958) (*citing United States v. Fisk*, 70 U.S. 445, 448 (1865)).

[152] *See* section X of the *First Report and Order* for a discussion of the applicability of section 251 to CMRS providers.

ice, such a provider is entitled to receive the benefits of local dialing parity. Regarding USTA's argument that applying section 251(b)(3) in a way that benefits CMRS providers could complicate implementation of sender pays arrangements in some states, we conclude that the record before us is insufficient to determine whether, or under what circumstances, sender pays arrangements, including those requiring the dialing of extra digits or recorded announcements, are consistent with the 1996 Act. Although we do not intend to preclude the states from lawfully enforcing legitimate consumer protection policies that do not have an anticompetitive impact, we cannot conclude on this record that the arrangements USTA describes would be permissible. Finally, given our expectation that local dialing parity will be achieved through LECs' compliance with other section 251 requirements, we do not adopt a timetable for implementing the local dialing parity requirements.

2. Local Dialing Parity Methodologies

a. Background and Comments

69. In the *NPRM*, we stated our expectation that the local dialing parity obligations would not be achieved through presubscription.[153] Rather, we anticipated that a customer's ability to select a telephone exchange service provider and make local telephone calls without dialing extra digits will be accomplished through the unbundling, number portability and interconnection requirements of section 251.[154] The *NPRM* sought information and comment as to how the local dialing parity requirement should be implemented.[155]

---

153 *NPRM* at para. 207 n.284.

154 *Id.*

155 *NPRM* at paras. 209, 211.

70. The parties generally agree that local dialing parity will be accomplished through implementation of the unbundling, number portability and interconnection requirements of section 251.[156] Parties add to this list the 1996 Act's equal access requirements.[157] A few parties contend that local dialing parity is assured once competing providers of telephone exchange service are permitted nondiscriminatory access to telephone numbers.[158]

b. Discussion

71. We anticipate that local dialing parity will be achieved upon implementation of the number portability and interconnection requirements of section 251. We also concur with the view that the ability of competing local exchange service providers to receive telephone numbers on a nondiscriminatory basis is critical to the achievement of local dialing parity. We believe that the interconnection requirements that section 251(c)(2) imposes on incumbent local exchange carriers will reduce the likelihood that customers of a competing LEC will have to dial an access code to reach a customer of the incumbent LEC insofar as the two networks are connected. Number portability will ensure that customers switching local service providers will not need to dial additional digits to make local telephone calls. Likewise, allowing every telecommunications carrier authorized to provide local telephone service, exchange access, or paging service in an area code to have at least one NXX in an existing area code also reduces the potential local dialing disparity that may result if competing LECs can only give customers numbers from a new area code. We therefore decline to prescribe now any additional guidelines addressing the methods that LECs may use to accomplish local dialing parity. We also conclude that, contrary to the views expressed by some parties, the

---

156 *See, e.g.*, SBC comments at 3 n.4; NEXTLINK comments at 8.

157 *See, e.g.*, BellSouth comments at 9.

158 *See, e.g.*, U S WEST comments at 6.

provision of nondiscriminatory access to telephone numbers, by itself, does not fulfill the local dialing parity mandate of section 251(b)(3). Given that acquisition of a central office code by a LEC would not necessarily ensure that the LEC's customers would be relieved of an obligation to dial extra digits, access codes or some other special dialing protocol, the provision of nondiscriminatory access to telephone numbers does not by itself ensure local dialing parity. Rather, we find that under section 251(b)(3) each LEC must ensure that its customers within a defined local calling area be able to dial the same number of digits to make a local telephone call notwithstanding the identity of the calling party's or called party's local telephone service provider.

3. Non-Uniform Local Calling Areas

a. Background

72. The *NPRM* tentatively concluded that, pursuant to section 251(b)(3), a LEC is required to permit telephone exchange service customers within a defined local calling area to dial the same number of digits to make a local telephone call, notwithstanding the identity of a customer's or the called party's local telephone service provider.[159] The *NPRM* did not address the potential dialing parity implications of non-uniform local calling areas[160] nor did it address the potential impact of our proposed interpretation of the local dialing parity obligation on local calling area boundaries.[161]

---

159 *NPRM* at para. 211.

160 We use the term "non-uniform local calling area" to refer to a situation in which a telephone exchange service provider's local calling area is either larger or smaller than that of another telephone exchange service provider that is providing telephone exchange service in the same geographic area.

161 Insofar as parties contend that the section 251(b)(3) dialing parity requirements compel the use of a ten-digit dialing plan for

b. Comments

73. A number of parties express concern about the potential interrelationship between our proposed interpretation of the local dialing parity requirements and local calling area boundaries.[162] For example, WinStar cautions the Commission that by requiring that customers "within a defined local calling area" be able to dial the same number of digits to make a local telephone call, certain parties may interpret this to require that a competing provider of local exchange service must define its local calling area to match the local calling area of the incumbent LEC.[163] GSA/DOD maintains that dialing is not truly at parity if different carriers have different definitions of the geographic areas in which calls can be made with seven-digit dialing.[164] To address the potential dialing parity issue that may arise when a new entrant's "network coverage" is more limited than the incumbent LEC's, GSA/DOD recommends that the Commission adopt rules that ensure that local calling areas are consistently defined for LEC wholesale and retail services.[165]

74. GTE contends that "[s]o long as new entrants have the technical ability to deploy equipment necessary to offer the same seven-digit dialing as the incumbent LEC, dialing

---

local calls within an area code overlay (*see, e.g.*, MFS comments at 3-5), we note that these concerns are addressed more fully below in paragraphs 286 through 287.

162 *See, e.g.*, WinStar comments at 10-11; GSA/DOD comments at 4-5; Florida Commission comments at 3.

163 WinStar comments at 10-11 ("The Commission should proceed carefully to ensure that it does not inadvertently limit carriers from experimenting with local calling areas"); *see also*, U S WEST comments at 6 (where dialing parity disputes arise over fact that local calling areas of two competing LECs do not match, states should resolve such disputes since they are familiar with local calling areas and calling patterns in that state).

164 GSA/DOD comments at 4.

165 *Id.* at 5.

parity should be deemed to exist even if one or more of the new entrants ultimately chooses to provide ten-digit dialing." [166] To illustrate its point that all local calls cannot be dialed using the same number of digits, NYNEX notes that in the New York City Metro LATA local calls span three different area codes, with seven-digit dialing within an area code and ten-digit dialing between area codes.[167] Finally, the Florida Commission expresses concern regarding the potential customer confusion that may result if customers in local calling areas are required to dial ten rather than the currently dialed seven digits to make local "Extended Calling Service" calls.[168]

c. Discussion

75. A telephone call requiring seven-digit dialing is not necessarily a local call [169] and a telephone call requiring ten-digit dialing is not necessarily a toll call.[170] Disparity in local dialing plans, by itself, does not contravene our interpretation of the local dialing parity requirements unless such plans are anti-competitive in effect.[171] By requir-

[167] NYNEX comments at 3 n.6.

[168] Florida Commission comments at 3.

[169] We note that several states permit seven-digit dialing for toll calls. *North American Numbering Plan, Area Codes 1996 Update*, Bellcore (January 1996) at 14. For example, within the 518 area code a call from Clifton Park, New York to Hague, New York is a toll call that can be dialed with seven digits.

[170] Section 3(48) defines "telephone toll service" as "telephone service between stations in different exchange areas for which there is made a separate charge not included in contracts with subscribers for exchange service." 47 U.S.C. § 153(48). By contrast, charges for calls within a local calling area generally are not assessed on a per call basis. Thus, the construct of local calling areas serves as the basis by which carriers price their services.

[171] *See, e.g.*, the discussion at paras. 281-291 regarding the discriminatory and anticompetitive nature of a service-specific or technology-specific overlay in connection with area code relief plans.

ing that all customers "within a defined local calling area" be able to dial the same number of digits to make a local telephone call, we do not intend to require a competing provider of local exchange service to define its local calling area to match the local calling area of an incumbent LEC. We further do not intend to require a competing provider of telephone exchange service that voluntarily chooses to provide ten-digit as opposed to seven-digit dialing in a local calling area to modify its dialing plan in this instance in order to conform to the dialing plan of another LEC. No other commenter addressed GSA's proposal that the Commission adopt rules that ensure that local calling areas are consistenty defined for LEC wholesale and retail services. Therefore, we conclude that the record is insufficient to permit us to take such action at this time.

* * * *

78. While several commenters urge the Commission to adopt rules for balloting,[182] the majority of parties urge us to reject this option.[183] Parties that oppose balloting argue that such decisions should be left to the individual states [184] and claim that balloting is confusing to customers,[185] costly,[186] and forces consumers to make selections before they might otherwise choose to do so.[187] Commenters also argue that competition for customers will ensure that carriers notify customers as to how their serv-

ices can be obtained.[188] In stating its opposition to a balloting requirement, MFS observes that:

> the long-distance market today differs markedly from the situation in the mid-1980's, when non-dominant carriers were virtually unknown to most consumers and balloting was mandated as a way of educating consumers to their ability to choose a carrier. No such education is needed today, because most consumers are well aware of their long-distance choices, and the carriers have readily available means of contacting those who are not.[189]

* * * *

c. Discussion

92. We conclude that, in order to ensure that dialing parity is implemented in a procompetitive manner, national rules are needed for the recovery of dialing parity costs. We further conclude that these costs should be recovered in the same manner as the costs of interim number portability, as mandated in our recent *Number Portability Order*.[224] Our authority to promulgate national cost recovery rules derives from section 251(d) of the 1996 Act and section 4(i) of the 1934 Act. In section 251(d), Congress directed the Commission to take the necessary steps to implement section 251. Section 4(i) of the 1934 Act authorizes us to take any action we consider "necessary and proper" to further the public interest in the regulation of telecommunications. Because we determine that dialing parity is crucial to the development of local exchange competition, we conclude that we should establish pricing principles for the recovery of dialing par-

224 *Telephone Number Portability*, FCC 96-286, CC Docket No. 95-116 (July 2, 1996) (*Number Portability Order*).

ity costs. Accordingly, we reject the arguments of incumbent LECs and others who oppose national standards for cost recovery of the network upgrades required to achieve dialing parity.

93. Many of the network upgrades necessary to achieve dialing parity, such as switch software upgrades, are similar to those required for number portability. Moreover, with both dialing parity and number portability, customer inconvenience represents the barrier to effective competition Congress intends to eliminate, whether that inconvenience results from the dialing of extra digits in the case of dialing parity, or notification of family, friends and business contacts when a customer is forced to change his or her number. For these reasons, we determine that our recent *Number Portability Order* provides guidance regarding which costs incumbent LECs should be able to recover in implementing dialing parity, as well as how such costs should be recovered. The rules adopted in the *Number Portability Order* apply only to currently-available number portability mechanisms. We sought further comment on cost recovery for long-term number portability, because long-term number portability will involve a different kind of system that currently available solutions. We tentatively concluded that under section 251(e)(2), the same cost recovery principles should apply to long-term number portability. In the case of dialing parity, there is a similar distinction between currently-available solutions (*i.e.*, full 2-PIC presubscription), and long-term solutions (*i.e.*, multi-PIC or smart-PIC methodologies). Like number portability, we may need to revisit the issue of an appropriate cost recovery standard once other presubscription technologies become available on a nationwide basis.

94. In the *Number Portability Order*, we concluded that costs for number portability should be recovered on a

competitivey-neutral basis.[225] We also concluded that any recovery mechanism should: (1) not give one service provider an appreciable, incremental cost advantage over another service provider, when competing for a specific subscriber; and (2) not have a disparate effect on the ability of competing service providers to earn a normal return.[226] We therefore reject the arguments of those commenters that assert that only new entrants should bear the costs of implementing dialing parity, because such an approach would not be competitively neutral. We also concluded in the *Number Portability Order* that LECs could only recover the incremental costs of implementing number portability. Because we determine that number portability and dialing parity share significant technical similarities and overcome similar barriers to competition, we conclude that we should impose the same cost standard for dialing parity costs that we have adopted for number portability costs. We therefore agree with AT&T that LECs may not recover from other carriers under a dialing parity cost recovery mechanism any network upgrade costs not related to the provision of dialing parity.

95. In our *Number Portability Order*, we concluded that the costs of long-term number portability that could be recovered through a competitively-neutral mechanism included installation of number portability-specific switch software, implementation of SS7 and IN or AIN capability, and the construction of number portability databases.[227] We determined that states could use several allocators, including gross telecommunications revenues, number of lines, and number of active telephone numbers, to

---

[225] Section 251(e)(2) of the 1996 Act states that "the cost of establishing . . . number portability shall be born by all telecommunications carriers on a competitively neutral basis, as determined by the Commission." This statutory provision does not apply to the dialing parity requirement.

[226] *Number Portability Order* at paras. 121-140.

[227] *Id.* at para. 122.

spread number portability costs across all telecommunications carriers.[228] Applying the same cost recovery principles to dialing parity, we conclude that LECs may recover the incremental costs of dialing parity-specific switch software, any necessary hardware and signalling system upgrades, and consumer education costs that are strictly necessary to implement dialing parity. These costs must be recovered from all providers of telephone exchange service and telephone toll service in the area served by a LEC, including that LEC, using a competitively-neutral allocator established by the state.[229] Although, under section 251(e)(2), number portability costs must be recovered from all telecommunications carriers, section 251(b)(3) only requires that dialing parity be provided to providers of telephone exchange service and telephone toll service. Therefore, we concluded that a competitively-neutral recovery mechanism for dialing parity should only allocate costs to this more limited class. States may use any of the allocators described in the *Number Portability Order*, or any other allocator that meets the criteria we have established. States should apply the principles we adopt today, and the other guidelines for recovering costs of currently available number portability measures, in establishing more specific cost recovery requirements for dialing parity.

* * * *

292. Finally, we address petitions for clarification or reconsideration that were filed in the *Ameritech* and *NANP* proceedings. On February 22, 1995, Comcast Corporation filed a Petition for Clarification or Reconsideration of the *Ameritech* Order regarding the Commission's

---

[228] *Id.* at paras. 134-36.

[229] We recognize that, unlike the case for number portability costs, states would not be able to establish a cost allocator based on numbers of lines because such an allocator could not apportion costs on a competitively neutral basis where dialing parity is provided to a CMRS provider. We expect that states will establish a competitively neutral allocator that can be used to apportion costs among all providers.

jurisdiction over numbering administration.[619] In its petition, Comcast seeks clarification of the *Ameritech Order* to the extent that it implies the Commission does not have broad statutory authority over the assignment of numbering resources, and seeks reconsideration of any implication in the *Ameritech Order* that the Commission's authority is limited by or subordinate to state interests.[620] Because section 251(e)(1) gives the Commission exclusive jurisdiction over numbering matters in the United States, any uncertainty about the Commission's and the states' jurisdiction over numbering administration that may have existed prior to the 1996 Act has now been eliminated. In light of the enactment of section 251(e)(1), Comcast's request that the Commission reconsider its conclusion in the *Ameritech Order* that the Commission does not retain plenary jurisdiction over numbering issues in the United States is moot. Accordingly, we dismiss Comcast's petition.

* * * *

343. Section 251(e)(2) requires that the costs of telecommunications numbering administration be borne by all telecommunications carriers on a competitively neutral basis. Contributions based on gross revenues would not be competitively neutral for those carriers that purchase telecommunications facilities and services from other telecommunications carriers because the carriers from whom they purchase services or facilities will have included in their gross revenues, and thus in their contributions to number administration, those revenues earned from services and

facilities sold to other carriers. Therefore, to avoid such an outcome, we require all telecommunications carriers to subtract from their gross telecommunications services revenues expenditures for all telecommunications services and facilities that have been paid to other telecommunications carriers.[713] It should be noted that this requirement is solely for the purpose of determining a carrier's contribution to numbering administration costs and not for any other purpose, interpretation, or meaning of any other Commission rule such as those contained in Parts 32, 36, 51, 64, 65, or 69 of the Commission's rules.

Submitted Oct. 3, 1996
Filed Oct. 15, 1996

Before BOWMAN, WOLLMAN and HANSEN, Circuit Judges.

HANSEN, Circuit Judge.

These cases have been consolidated in this circuit by the September 11, 1996 order of the Judicial Panel on Multidistrict Litigation, Docket No. RTC-31, pursuant to Rule 24 of the *Rules of Procedure of the Judicial Panel on Multidistrict Litigation*. *See* 28 U.S.C. § 2112(a)(3) (1994). Numerous petitioners have moved this court for a stay pending judicial review of the Federal Communications Commission's First Report and Order.[1] The FCC promulgated the rules and regulations in its First Report and Order pursuant to its reading of its statutory duty to implement the local competition provisions of the Tele-

[1] First Report and Order, *Implementation of the Local Competition Provisions in the Telecommuncations Act of 1996*, CC Docket No. 96-98 (Aug. 8, 1996) [hereinafter First Report and Order].

communications Act of 1996 (the Act).[2] This court granted a temporary stay on September 27, 1996, pending oral argument. After hearing oral argument on October 3, 1996, from representatives of the concerned parties, we have decided to stay the operation and effect of only the pricing provisions[3] and the "pick and choose" rule[4] contained in the FCC's First Report and Order pending our final determination of the issues raised by the pending petitions for review.

I.

In the Telecommunications Act of 1996, Congress enacted a plan to alter the monopolistic structure of local telephone service markets with an injection of competition. The Act effectively opens up local markets by imposing several new obligations on the existing providers of local telephone service in those markets. The Act refers to the current local providers as "incumbent local exchange carriers" (incumbent LECs). *See* 47 U.S.C.A. §§ 251(c), (h), 252(j) (West Supp. May 1996). Among other duties, the Act requires incumbent LECs (1) to allow other telecommunication carriers (such as cable television companies and current long-distance providers) to interconnect with the incumbent LEC's existing local network to provide competing local telephone service (interconnection); (2) to provide other telecommunication carriers access to elements of the incumbent LEC's local network on an unbundled basis (unbundled access); and (3) to

---

[2] Telecommunications Act of 1996, Pub. L. No. 104-104, 110 Stat. 56 (to be codified as amended in scattered sections of 47 U.S.C.).

[3] The pricing provisions refer to First Report and Order. Appendix B-Final Rules §§ 51.501-51.515 (inclusive), 51.601-51.611 (inclsive), 51.707-51.717 (inclusive) and to the default proxy range for line ports used in the delivery of basic residential and business exchange services established in the FCC's Order on Reconsideration, dated September 27, 1996.

[4] The "pick and choose" rule refers to First Report and Order, Appendix B-Final Rules § 51.809.

sell to other telecommunication carriers, at wholesale rates, any telecommunitacions service that the incumbent LEC provides to its retail customers (resale). *Id.* § 251 (c).

To accomplish these directives, the Act places a duty on incumbent LECs to privately negotiate, in good faith, comprehensive agreements with other telecommunication carriers seeking to enter the local market. *See id.* §§ 251 (c)(1) and 252(a). If the incumbent LEC and the carrier seeking entry are unable to reach a negotiated agreement, either party may petition the respective state utility commission to conduct a compulsory arbitration of the open and disputed issues and arrive at an arbitrated agreement. *See id.* § 252(b). The final agreement, whether arrived at through negotiation or arbitration, must be approved by the state commission. *Id.* § 252(e)(1). Certain portions of the Act also require the FCC to participate in the Act's implementation. *See, e.g., id.* §§ 251(b)(2), (d)(1), (e), 252(e)(5). The FCC's regulations pertaining to the Act form the heart of the controversies at bar.

On August 8, 1996, the FCC released its First Report and Order in which it published its comments and rules regarding the local competition provisions of the Act. The petitioners in this consolidated proceeding, consisting, at the moment, primarily of incumbent LECs and state utility commissions, argue that the FCC exceeded its authority in promulgating these rules. While several of the petitioners object to the FCC's regulations in their entirety, others specifically challenge the FCC's rules regarding the prices that an incumbent LEC may charge an incoming competitor for interconnection, unbundled access to network elements, and resale of its services.

Despite the different approaches, it is clear that all of the petitioners object principally to the FCC's pricing rules. One such rule is a mandate from the FCC that state commissions employ the "total element long-run incremental

cost" (TELRIC) method to calculate the costs that an incumbent LEC incurs in making its facilities available to competitors. *See* First Report and Order, Appendix B-Final Rules §§ 51.503, 51.505. After applying the TELRIC method and arriving at a cost figure, the state commissions, acting as arbitrators, must then determine the price that an incumbent LEC may charge its competitors, based on the TELRIC driven cost figure. *See id.*

Many of the incumbent LECs object to the TELRIC method for two reasons. First, it does not consider their "historical" or "embedded" costs (costs that an incumbent incurred in the past) in calculating the cost figure to be used to determine the rates. *See* id. § 51.505(d)(1). Second, it requires that an incumbent LEC's cost be measured as if the incumbent were using the most efficient telecommunication technology currently available, regardless of the technology presently employed by the incumbent and to be used by the competitor. *See id.* § 51.505(b)(1). The incumbent LECs argue that the TELRIC method underestimates their costs and results in prices that are too low. The incumbent LECs maintain that these low prices would effectively require them to subsidize their competitors and thereby threaten the viability of the LEC's own businesses.

For similar reasons, the petitioners also object to the FCC's proxy rates, which are to be used by the state commissions if they elect not to employ the TELRIC method to set prices. *See id.* §§ 51.503(b)(2), 51.513, 51.705(a)(2), 51.707. The incumbent LECs argue that these proxy rates do not accurately reflect their costs and are artificially low. In addition to the rules regarding TELRIC and the proxy rates, the petitioners object to several other FCC regulations that pertain to the pricing of intrastate telephone service.[8]

---

[8] The state utilities commissions take issue with the "deaveraging" rule requiring them to establish different rates in at least three dif-

Some of the petitioners also seek to stay the FCC's so-called "pick and choose" rule, *id.* § 51.809, with which the FCC purports to implement § 252(i) of the Act. Section 252(i) requires an LEC to make available any interconnection, service, or network element contained in an approved agreement to which it is a party to any other telecommunications carrier upon the same "terms and conditions" as those provided in the agreement. Here again, price becomes a key issue. When the FCC promulgated its rule, it expanded the statutory language of § 252(i) to include "*rates*, terms, and conditions." *Id.* § 51.809 (emphasis added). The petitioners' objection is that the rule would permit the carriers seeking entry into a local market to "pick and choose" the lowest-priced individual elements and services they need from among all of the prior approved agreements between that LEC and other carriers, taking one element and its price from one agreement and another element and its price from a different approved agreement. Moreover, if an LEC and Carrier A, for example, reach an approved agreement, and then the LEC and a subsequent entrant, Carrier B, agree in their agreement to a lower price for one of the elements or services provided for in the LEC's agreement with Carrier A, Carrier A will be able to demand that its agreement be modified to reflect the lower cost negotiated in the agreement with Carrier B. Consequently, the petitioners assert that the congressional preference for negotiated agreements would be undermined because an agreement would never be finally binding, and the whole methodology for negotiated and arbitrated agreements would be thereby destabilized.

---

ferent geographic areas within each state. *See id.* § 51.507(f). Many of the incumbent LECs also challenge the FCC's wholesale rate rules, asserting that the FCC's mandated method for calculating these rates, as well as its interim wholesale rates, result in rates that are also too low and threaten the incumbent LEC's viability. *See id.* §§ 51.607, 51.609, 51.611.

II.

We consider the following four factors in determining whether a stay is warranted: (1) the likelihood that a party seeking the stay will prevail on the merits of the appeal; (2) the likelihood that the moving party will be irreparably harmed absent a stay; (3) the prospect that others will be harmed if the court grants the stay; and (4) the public interest in granting the stay. *See Arkansas Peace Ctr. v. Dep't of Pollution Control*, 992 F.2d 145, 147 (8th Cir. 1993), *cert. denied*, 511 U.S. 1017, 114 S.Ct. 1397, 128 L.Ed.2d 70 (1994); *Wisconsin Gas Co. v. F.E.R.C.*, 758 F.2d 669, 673-74 (D.C. Cir. 1985), *cert. denied*, 476 U.S. 1114, 106 S.Ct. 1968, 1969, 90 L.Ed.2d 653 (1986). Applying these factors to the case at hand leads us to conclude that a stay pending final review of the FCC's pricing and "pick and choose" rules is justified.

A.

In evaluating the likelihood of the petitioners' success on appeal, we note that the petitioners "need not establish an absolute certainty of success." *Population Inst. v. McPherson*, 797 F.2d 1062, 1078 (D.C. Cir. 1986). Instead, as the actual terms of the test indicate, the petitioners must show that they are "likely" to succeed on the merits. Here, the petitioners allege primarily that the FCC exceeded its jurisdiction by imposing national pricing rules for what is essentially local service. They argue that the text and the structure of the Act give the States, not the FCC, authority over the pricing of intrastate telephone service. After evaluating the contentions of all of the interested parties, we believe that the petitioners present a strong argument that is sufficient to satisfy the first prong.

Historically, the state commissions have determined the rates for intrastate communications services. *See* Communications Act of 1934, § 2(b), 47 U.S.C. § 152(b) (1994). Subsection 252(d), which indicates that state commissions have the authority to determine "just and

reasonable rates" necessary to implement the local competition provisions of the Act appears consistent with that past practice. This subsection, entitled "Pricing standards," makes no mention of FCC rules on pricing. Moreover, subsection 252(c)(2) directs state commissions to "establish any rates for interconnection, services, or network elements according to subsection (d) of this section." Again, no reference is made to FCC regulations regarding rates. By contrast, where Congress intended for the state commissions to follow FCC rules in arbitrations, it expressly said so. In subsection 252(c)(1), the Act requires state commissions to ensure that their resolutions of arbitrated disputes comply with both section 251 and with the regulations that the FCC is specifically authorized to issue under section 251. But nowhere in section 251 is the FCC specifically authorized to issue rules on pricing. The sections of the Act that directly authorize the state commissions to establish prices are devoid of any command requiring the state commissions to comply with FCC pricing rules (or, for that matter, authorizing the FCC to issue any pricing rules). This absence indicates a likelihood that Congress intended to grant the state commissions the authority over pricing of local telephone service, either by approving or disapproving the agreements negotiated by the parties, or, when the parties cannot agree, through compulsory arbitration, thereby preserving what historically has been the States' role.

We are mindful of the FCC's contrary interpretation of the Act. The FCC asserts that subsection 251(d)(1), when read together with subsection 252(c)(1), authorizes the FCC to establish rules regarding pricing. Subsection 251(d)(1) directs the FCC to complete the promulgation of regulations pursuant to its duties under section 251 by August 8, 1996. The FCC also urges us to read the general provisions of subsection 251(c) together with subsection 252(d) (the pricing standards) and conclude that these portions of the Act supply the FCC with the power to issue pricing rules.

BEST AVAILABLE COPY

We recognize that courts must give deference to an agency's reasonable interpretation of an unclear statute. *See Chevron U.S.A., Inc. v. Natural Resources Defense Council*, 467 U.S. 837, 843-45, 104 S.Ct. 2778, 2781-83, 81 L.Ed.2d 694 (1984). In this case, however, we believe that the petitioners have a better than even chance of convincing the court that the FCC's pricing rules conflict with the plain meaning of the Act, in which case the court would not be bound by *Chevron* deference and would be entitled to overturn the agency's interpretation. *See id.* at 842-43, 104 S.Ct. at 2781 ("If the intent of Congress is clear, that is the end of the matter, for the court, as well as the agency, must give effect to the unambiguously expressed intent of Congress."); *id.* at 844, 104 S.Ct. at 2782-83 (indicating that courts should not give controlling weight to regulations that are contrary to the statute). In this, our first look at the issue, we are skeptical that the FCC's roundabout construction of the statute could override what, at first blush, appears to be a rather clear and direct indication in subsections 252(c)(2) and 252(d) that the state commissions should establish prices.

Moreover, we have serious doubts that the FCC's interpretation of the Act constitutes the straightforward or unambiguous grant of intrastate pricing authority to the FCC sufficient to qualify as an exception to the provisions of subsection 2(b) of the Communications Act of 1934, 47 U.S.C. § 152(b) (1994). *See Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355, 377, 106 S.Ct. 1890, 1903, 90 L.Ed.2d 369 (1986). Subsection 2(b) provides that "nothing in this Chapter shall be construed to apply or to give the [FCC] jurisdiction with respect to . . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communications service." 47 U.S.C. § 152(b) (1994). In *Louisiana*, the Supreme Court determined that in order to overcome subsection 2(b)'s limits on the FCC's jurisdiction with respect to intrastate communications service, Congress must "unambiguously" or "straightforwardly"

either modify subsection 2(b) or grant the FCC additional authority. 476 U.S. at 377, 106 S.Ct. at 1903. We acknowledge that portions of the Telecommunications Act of 1996 expressly grant the FCC authority over some aspects of intrastate telephone service. *See, e.g.*, 47 U.S.C.A. § 251(e) (West Supp. May 1996) (FCC authority regarding numbering administration). We have been unable, however, to find such an express grant of authority to the FCC over the pricing of intrastate telephone service, nor does there appear to be a modification of subsection 2(b).[6] The combination of these omissions indicates a sufficient likelihood that the petitioners will succeed on the merits of their appeal. We, of course, remain open to being persuaded that the FCC's read is the correct one when full briefing and argument on the merits have been concluded.

Because we believe that the petitioners have demonstrated that they will likely succeed on the merits of their appeals based on their argument that, under the Act, the FCC is without jurisdiction to establish pricing regulations regarding intrastate telephone service, we think that it is unnecessary at this time to address the remaining theories which the petitioners use to challenge the legality of the FCC's pricing rules.

B.

With respect to the likelihood of irreparable harm, the petitioners initially assert that their interest in productive ongoing negotiations and arbitrations regarding the implementation of the Act will be irreparably harmed if the FCC's pricing regulations are not stayed. They argue that the competitors seeking entry into the local phone markets will refuse even to consider prices that are higher than the FCC's proxy rates and will simply hold out for

---

[6] In fact, we are told that a provision which specifically modified subsection 2(b) was expressly rejected by Congress before the bill was passed. *See* S. 652, 104th Cong., 1st Sess. § 101(c) (1995).

the proxy rates that the States will feel obligated to impose in their arbitrations. In this manner, the proxy rates effectively establish a price ceiling, an observation recognized by the FCC itself, which inevitably confines and restricts the give and take characteristic of free negotiations and arbitrations. The state commissions specifically argue that the FCC's pricing regulations effectively undermine their authority, and if not stayed, the rules will disrupt the predictability and continuity of the existing regulatory system. The state commissions explain that the FCC pricing rules essentially handcuff their discretion in determining the just and reasonable rates in arbitrations required under subsection 252(d)(1).

In order to demonstrate irreparable harm, a party must show that the harm is certain and great and of such imminence that there is a clear and present need for equitable relief. *See Packard Elevator v. I.C.C.*, 782 F.2d 112, 115 (8th Cir. 1986), *cert. denied*, 484 U.S. 828, 108 S.Ct. 98, 98 L.Ed.2d 59 (1987) (quoting *Wisconsin Gas*, 758 F.2d at 673-74). The FCC asserts that the petitioners' allegations of irreparable harm are merely speculative and that there is no certainty that its proxy rates will ever be applied to the petitioners. We are persuaded, however, by the petitioners' evidence that the negotiations preferred by the Congress are already breaking down due to the competitors' desire to hold out for the FCC's proxy rates. Moreover, given the time constraints under the Act, some state commissions have already felt obliged to impose the proxy rates in their arbitrations. These experiences indicate that the FCC's pricing rules will derail current efforts to negotiate and arbitrate agreements under the Act, and the "pick and choose" rule will operate to further undercut any agreements that are actually negotiated or arbitrated. The inability of the incumbent LECs and the state commissions to effectively negotiate and arbitrate agreements free from the influence of the FCC's pricing rules, including the "pick and choose" rule, will irreparably injure the in-

terests of the petitioners. If the FCC's rules are later struck down, it will be extremely difficult for the parties to abandon the influence of their previous agreements that were based on the national pricing rules and to recreate the atmosphere of free negotiations that would have existed in the absence of the FCC's dictated presumptive prices. Without a stay, the opportunity for effective private negotiations will be irretrievably lost. We initially believe that this result would be contrary to Congress's intent that these matters be resolved through negotiation and/or arbitration.

The petitioners also argue that the FCC's pricing rules will force the incumbent LECs to offer their services to requesting carriers at prices that are below actual costs, causing the incumbent LECs to incur irreparable losses in customers, goodwill, and revenue. The FCC contends that its pricing rules, in particular its proxy rates, are merely an option for the parties and the state commissions to consider, and consequently the petitioners cannot make a showing that the harm is certain and imminent, as required in *Packard Elevator*, 782 F.2d at 115. As we explained above, we are persuaded that, absent a stay, the proxy rates would frequently be imposed by the state commissions and would result in many incumbent LECs suffering economic losses beyond those inherent in the transition from a monopolistic market to a competitive one. We are mindful of the precedents that declare that "economic loss does not, in and of itself, constitute irreparable harm," *Wisconsin Gas*, 758 F.2d at 674, and that "revenues and customers lost to competition which can be regained through competition are not irreparable." *Central & S. Motor Freight Tariff Ass'n v. United States*, 757 F.2d 301, 309 (D.C. Cir. 1985), *cert. denied*, 474 U.S. 1019, 106 S.Ct. 568, 88 L.Ed.2d 553 (1985). Both of these propositions, however, rest on the assumption that the economic losses are recoverable. The threat of unrecoverable economic loss, however, does qualify as irrep-

arable harm. *See Baker Elec. Coop., inc. v. Chaske*, 28 F.3d 1466, 1473 (8th Cir. 1994); *Airlines Reporting Corp. v. Barry*, 825 F.2d 1220, 1227 (8th Cir. 1987). In this case, the incumbent LECs would not be able to bring a lawsuit to recover their undue economic losses if the FCC's rules are eventually overturned, and we believe that the incumbent LECs would be unable to fully recover such losses merely through their participation in the market. Moreover, the petitioners' potential loss of consumer goodwill qualifies as irreparable harm. *See Multi-Channel TV Cable Co. v. Charlottesville Quality Cable Operating Co.*, 22 F.3d 546, 552 (4th Cir. 1994) (holding that the possibility of permanent loss of customers to a competitor or the loss of goodwill satisfies the irreparable injury prong). For the foregoing reasons, we believe that the petitioners have adequately demonstrated that they will be irreparably harmed if a stay of the FCC's pricing rules is not granted.

C.

In assessing whether others will be harmed if the court grants the stay, we acknowledge that our decision, either way, will unavoidably adversely affect the interests of either the incumbent LECs or their potential competitors. If we decide to grant the stay, we recognize that the companies seeking entry into the local telephone markets will have to negotiate and arbitrate their agreements without the added leverage of the FCC's pricing rules, and assuming that the FCC's rules were later upheld, they would likely renegotiate the terms of their agreements. The inconvenience of this scenario, however, is outweighed by the harm and difficulties of its alternative, discussed in the previous section. In other words, we think that it would be easier for the parties to conform any variations in their agreements to the uniform requirements of the FCC's rules if the rules were later upheld than it would be for the parties to rework agreements adopted under the FCC's

rules if the rules were later struck down. Consequently, we conclude that any harm that other parties may endure as a consequence of imposing a stay is outweighed by the irreparable injury that the petitioners would sustain absent a stay.

D.

The FCC argues that a stay would not promote the public interest because it would not maintain the status quo and it would block the road to competiton in local telephone service markets. We reject both contentions. Before the FCC published its regulations pursuant to the Act, several incumbent LECs, potential competitors, and state utility commissions were all working together to implement the local competition provisions of the Act. The Act's system of private negotiation backed by state-run arbitration was operating without the input from the FCC. A stay would preserve the continuity and stability of this regulatory system—a system that has initially proved to be successful. The FCC asserts that without its pricing regulations in effect, the incumbent LECs will be able to exert their superior bargaining power over their potential competitors and impose unreasonable rates for their services. This argument ignores the empirical success that private parties and the state commissions have had in implementing the local competition provisions of the Act.[7] It also denigrates the proven ability of the state commissions to prevent incumbent LECs from charging excessive rates for their services. The Act requires rates to be just and reasonable and it authorizes state commission to enforce these

[7] We note that some states, Connecticut, Florida, and Iowa in particular, have already established rates based on local conditions and are already involved in opening up their local markets to competition under both the federal Act and state statutes which foreshadowed the new federal law. Moreover, the FCC-imposed rate for Iowa is substantially higher than the state-set rate which was based on the full record from a contested case proceeding, while in Florida, the FCC proxy rate is substantially lower than the state-set rate.

requirements. Presently, we have no reason to doubt the ability of the state commissions to fulfill their duty to promote competition in the local telephone service markets and thus conclude that the public interest weighs in favor of granting a stay.

III.

Having concluded that the petitioners satisfy the four requirements for granting a stay, we grant the petitioners' motion to stay the FCC's pricing rules and the "pick and choose" rule contained in its First Report and Order [8] pending a final decision on the merits.

Upon the filing of this order, the stay imposed by our order of September 27, 1996, is dissolved, and is replaced by the stay imposed by the terms of this order.

---

[8] The stay pertains only to §§ 51.501-51.515 (inclusive), 51.601-51.611 (inclusive), 51.701-51.717 (inclusive), § 51.809, and the proxy range for line ports used in the delivery of basic residential and business exchange services established in the FCC's Order on Reconsideration, dated September 27, 1996.

30. Finally, we note that, traditionally, shared facilities are priced on a usage-sensitive basis, and dedicated facili-

ties are priced on a flat-rated basis. We believe that this usage-sensitive pricing mechanism provides a reasonable and fair allocation of cost between the users of shared transport facilities. For example, in the *Access Charge Reform Order*, specifically the sections dealing with rate structure issues for interstate access charges, we required that the cost of switching, a shared facility, be recovered on a per minute of use basis, while the cost of entrance facilities, which are dedicated to a single interexchange carrier, be recovered on a flat-rated basis.[83] We note that several state commissions, in proceeedings conducted pursuant to section 252 of the Act, have required incumbent LECs to offer shared transport priced on a usage-sensitive basis.[84] We acknowledge that, under the Eighth Circuit's decision, we may not establish pricing rules for shared transport. However, in situations where the Commission is required to arbitrate interconnection agreements pursuant to subsection 252(e)(5), we intend to establish usage-sensitive rates for recovery of shared transport costs unless parties demonstrate otherwise.[85]

* * * *

34. We also note that the failure of an incumbent LEC to provide access to all of its interoffice transport facilities on a shared basis would significantly increase the requesting carriers' costs of providing local exchange

---

[83] Access Charge Reform, First Report and Order, CC Docket 96-262, FCC 97-158 (rel. May, 16, 1997) (*Access Charge Reform Order*) at paras, 135, 153.

[84] *See, e.g.*, Michigan Public Service Commission, Case No. U-11280, July 14, 1997, Order at 26; Public Service Commission of Wisconsin, Case No. 6720-TI-120, Findings of Fact, Conclusions of Law, and Second Order, May 30, 1997.

[85] *See* 47 U.S.C. § 252(e)(5). *See also Local Competition Order*, 11 FCC Rcd at 16127-32, paras. 1283-95 (giving notice of certain minimum procedural rules and substantive standards that the Commission will use if it assumes jurisdiction pursuant to section 252(e)(5)).

service and thus reduce competitive entry into the local exchange market. In the *Local Competition Order*, we observed that:

> By unbundling various dedicated and shared interoffice facilities, a new entrant can purchase *all* interoffice facilities on an unbundled basis as part of a competing local network, or it can combine its own interoffice facilities with those of the incumbent LEC. The opportunity to purchase unbundled interoffice facilities will decrease the cost of entry compared to the much higher cost that would be incurred by an entrant that had to construct all of its own facilities. An efficient new entrant might not be able to compete if it were required to build interoffice facilities where it would be more efficient to use the incumbent LEC's facilities.[94]

We continue to find the foregoing statements to be true with respect to shared as well as dedicated transport facilities. Requesting carriers should have the opportunity to use *all* of the incumbent LEC's interoffice transport facilities. Moreover, the opportunity to purchase transport facilities on a shared basis, rather than exclusively on a dedicated basis, will decrease the costs of entry.

35. We believe that access to transport facilities on a shared basis is particularly important for stimulating initial competitive entry into the local exchange market, because new entrants have not yet had an opportunity to determine traffic volumes and routing patterns. Moreover, requiring competitive carriers to use dedicated transport facilities during the initial stages of competition would create a significant barrier to entry because dedicated transport is not economically feasible at low penetration rates. In addition, new entrants would be hindered by significant transaction costs if they were required to contin-

---

[94] *Local Competition Order*, 11 FCC Rcd at 15718-19, para. 441 (emphasis added).

ually reconfigure the unbundled transport elements as they acquired customers. We note that incumbent LECs have significant economies of scope, scale, and density in providing transport facilities. Requiring transport facilities to be made available on a shared basis will assure that such economies are passed on to competitive carriers. Further, if new entrants were forced to rely on dedicated transport facilities, even at the earliest stages of competitive entry, they would almost inevitably miscalculate the capacity or routing patterns. We recognize, however, that the need for access to all of the incumbent LEC's interoffice facilities on a shared basis may decrease as competitive carriers expand their customer base and have an opportunity to identify traffic volumes and call routing patterns. We therefore may revisit at a later date whether incumbent LECs continue to have an obligation, under section 251(d)(2), to provide access to all of their interoffice transmission facilities on a shared, usage sensitive basis.[95]

* * * *

43. We reject as well Ameritech's contention that a network element must be identifiable as a limited or preidentified portion of the network. We find nothing in the statutory definition of network elements that prohibits requesting telecommunications carriers from seeking access to every transport facility within the incumbent's network. Our definition of signalling as a network element does not require requesting carriers to identify in advance a particular portion of the incumbent LEC's signalling facilities, but instead permits requesting carriers to obtain access to multiple signalling links and signalling transfer points in

---

[95] We note that, if, in the future, competitive carriers gain sufficient market penetration to justify obtaining dedicated transport facilities, either through the use of unbundled elements or through building their facilities, shared transport may no longer meet the section 251(d)(2) requirements. In that event, the Commission can evaluate at that time whether incumbent LECs must continue to provide access to shared transport as a network element.

the incumbent LEC's network on an as-needed basis.[110] We also reject Ameritech's assertion that shared transport cannot be physically separated from switching.[111] Both dedicated and shared transport facilities are transport links between switches. These links are physically distinct from the end office and tandem switches themselves.

44. Although we conclude that shared transport is physically severable from switching, incumbent LECs may not unbundle switching and transport facilities that are already combined, except upon request by a requesting carrier. Although, the Eighth Circuit struck down the Commission's rule that required incumbent LECs to rebundle separate network elements,[112] the court nevertheless stated that it: "upheld the remaining unbundling rules as reasonable constructions of the Act, because, as we have shown, the Act itself calls for the rapid introduction of competition into the local phone markets by requiring incumbent LECs to make their networks available to . . . competing carriers."[113] Among other things, the court left in effect section 51.315(b) of the Commission's rules, which provides that, "[e]xcept upon request, an incumbent LEC shall not separate requested network elements that the incumbent LEC currently combines."[114] Therefore, although incumbent LECs are not required to combine transport and switching facilities to the extent that those elements are not already combined, incumbent LECs may not separate such facilities that are currently

[113] *Iowa Utilities Bd.* at *28.

[114] 47 C.F.R. § 51.315(b).

combined, absent an affirmative request. In addition to violating section 51.315(b) of our rules, such dismantling of network elements, absent an affirmative request, would increase the costs of requesting carriers and delay their entry into the local exchange market, without serving any apparent public benefit. We believe that such actions by an incumbent LEC would impose costs on competitive carriers that incumbent LECs would not incur, and thus would violate the requirement under section 251(c)(3) that incumbent LECs provide nondiscriminatory access to unbundled elements. Moreover, an incumbent LEC that separates shared transport facilities that are already connected to a switch would likely disrupt service to its own customers served by the switch because, by definition, the shared transport links are also used by the incumbent LEC to serve its customers. Thus, incumbent LECs would seem to have no network-related reason to separate network elements that it already combines absent a request.

* * * *

47. We also disagree with Ameritech's and BellSouth's argument that defining the unbundled network element shared transport as all transport links between any two incumbent LEC switches would be inconsistent with Congress's intention to distinguish between resale services and unbundled network elements. Section 251(c)(3) requires incumbent LECs to make available unbundled network elements at cost-based rates; sections 251(c)(4) and 252(d)(3) require incumbent LECs to make available for resale, at retail price less avoided costs, services the incumbent LEC offers to retail users. In the *Local Competition Order*, we held that a key distinction between section 251(c)(3) and section 251(c)(4) is that a requesting carrier that obtains access to unbundled network elements faces greater risks than a requesting carrier that only offers services for resale.[124] A requesting carrier that takes a network element dedicated to that carrier, and

---

[124] *Local Competition Order*, 11 FCC Rcd at 15668-69, para. 334.

recovered on a flat-rated basis, must pay for the cost of the entire element, regardless of whether the carrier has sufficient demand for the services that the element is able to provide. The carrier thus is not guaranteed that it will recoup the costs of the element. By contrast, a carrier that uses the resale provision will not bear the risk of paying for services for which it does not have customers.[125] In particular, a requesting carrier that takes an unbundled local switch must pay for all of the vertical features included in the switch, even if it is unable to sell those vertical features to end user customers.[126] Requesting carriers that purchase shared transport as a network element to provide local exchange service must also take local switching, for the practical reasons set forth herein, and consequently will be forced to assume the risk associated with switching.[127]

---

[125] *Iowa Utilities Bd.* at *26-27.

[126] *Local Competition Order*, 11 FCC Rcd at 15707-08, para. 414.

[127] A requesting carrier that uses its own self-provisioned local switches, rather than unbundled local switches obtained from an incumbent LEC, to provide local exchange and exchange access service would use dedicated transport facilities to carry traffic between its network and the incumbent LEC's network. Thus, the only carrier that would need shared transport facilities would one that was using an unbundled local switch.

August 18, 1997

SEPARATE STATEMENT OF CHAIRMAN REED HUNT

RE: Implementation of the Local Competition Provisions of the Telecommunications Act of 1996; Third Order on Reconsideration and Further Notice of Proposed Rulemaking

The Commission today reaffirms and clarifies a very important aspect of our Local Competition Order: the ability of a competitive local exchange carrier to obtain transport on a shared basis from the incumbent local exchange carrier. More fundamentally, this decision highlights the importance we place on incumbents making available to new entrants their network elements on a combined basis—a combination sometimes referred to as the UNE platform.

In the Telecommunications Act of 1996, Congress mandated that new entrants into the formerly monopolized local exchange market have the ability to choose any or all of three entry strategies: interconnection, resale and unbundled network elements. Congress correctly foresaw that new entrants would need these flexible strategies if they are to compete successfully with the incumbents and their extraordinary economies of scale and scope.

In its decision last month, the Eighth Circuit explicitly affirmed our authority under the Act to define unbundled network elements. This is a very important aspect of our local competition policies. Where the purpose or effect of moves by an incumbent LEC to break apart currently combined elements is to create a barrier to competition, we will take action to tear down or prevent the erection of such barriers.

AT&T INVESTMENT COMMUNITY MEETING

Transcript
March 3, 1997—AM Session

JOHN ZEGLIS: Okay, Thank you John. The subject is public policy. Like it or not, public policy still plays a very large role in AT&T's current operations and particularly its future aspirations. That's pretty much a function of where we've come from as a regulated utility. It's almost equally a function of where we want to go into regulated monopoly markets. It means we've had to seek a lot of change in the public policy arena. And my purpose here this morning is to persuade you that our program for this public policy work is not nearly as helter skelter as the briefs and the counter briefs, charges and counter charges may make you think on a daily basis. We have structured our initiatives in the public policy arena around these four central strategic objectives. Number one, we need to eliminate the unnecessary regulation of AT&T. That means there has been too much of it and it's been lopsided against us and in favor of our competitors. Number two, we need to open monopoly markets to new entry. That means the local exchanges in the United States and just about any other country outside this nation.

Number three, until we get those markets open, we need to enforce monopoly safeguards. The most celebrated here is clearly the MSJ like safeguard in the United States; no RBOC long-distance entry until their markets are competitive.

And then the fourth goal, also until we get those monopoly markets made competitive, is to use public policy to bring down this exorbitant 15 dollar carrier-to-carrier pay-

ment bill that we lug around? We call that access domestically and international settlement rates globally.

So the modus operandi for this talk is to look at those four objectives. We'll do all of them domestically first. We'll double back and do them internationally at the end.

We're going to talk about where we stand today, where we're going to go, what are the big plays this year and next, and in the end what kind of market framework can we deliver to AT&T for us to execute on our strategy.

All right. Number 1, deregulation of AT&T. This is the most fun because it's essentially done. We have had to seek this relief at two levels, state and federal. State as a practical matter we were done with long-distance regulation of our prices and earnings by the end of the 1980s. Further good news from the state, we're seeing no inclination to resume regulation of AT&T's new local service operations in a few of the states where nondominant by statute. In most of the others the commissions look like treating us for what we are. The second, third, fourth new entered with zero market share and not in need of any kind of traditional public utility regulation.

At the federal level, at the FCC this has been a tougher nut. And if you follow this, you know we've spent the 1990's peeling off the wraps a layer at a time.

The progression is also well-known to most of you. We've gone from rate of return to price caps to streamline tariffs to contract tariffs to nondominant domestically, to nondominant internationally and now we're even up to detariffing. And now we've got an adjustment to make in the course as to whether that's mandatory or whether we can use tariffs where it makes sense. The point of it all is that AT&T, state and federal, has now escaped active regulation of our prices, our earnings and our services. Along the way we've thrown off some ancillary wraps having to do with network disclosure, regulatory accounting rules, we've got a little mop up to do here. There is some

bundling rules out of the old computer inquiry two, prohibition of equipment and services going together. We need to work off some safety nets, improve some deaveraging rules. None of that is seriously getting in our way right now. The asymmetric regulation is completely gone. We're the same as MCI, Sprint and the other long-distance companies. We're better than the local exchange carriers whose markets we're entering. Truth is we'll probably always be subject to regulations at some level. But this is pretty close to about what we want say that regulation on AT&T is no longer a significant constraint on our strategy or its execution.

So I think the thing to do is to get off of that one and go onto numbers 2 and 3. These are more interesting because they are work in progress and they involve some heavy lifting still for the company and the industry. Recognize that the numbers 2 and 3 here are two sides of the same coin, opening the local exchanges and prohibiting the RBOC long-distance entry until we do. And since February of 1996 this has been pretty much a story of the new Telecom Act. We're going to look at these two objectives separately. But we ought to also recognize the critical interdependency that the act created. Prior to 1996 we had a serious policy disconnect on these two objectives. You had Judge Green deciding on long-distance entry for the RBOC, but he couldn't touch the local exchanges. You had the State deciding on local exchange entry, but they couldn't do anything about RBOC long-distance. And so the AT&T nightmare in all of this was that the MFJ relief would come out of sequence. That is, the courts would finish tearing down the MFJ and opening our long-distance market before the state had finished the job opening the local. And that's why the 1996 act is such a great relief to us. It connected the two objectives, it commanded the opening of local first, and only then do the RBOCs come out into long-distance. And now we're engaged in the key to its implementation,

namely we got to get the sequence correct so that the incentives stay in the right place.

All right. On that score, how are we doing? Well, I think as Bob told you, 1996 was the year of getting the rules in place for this new local entry. And our Congress dictated the order of events. The February Telecom Act gave us some standards. The FCC rule making in August gave us some more. Carrier negotiations in the spring and summer were to iron out some of the wrinkles and we were to go to the state commissions for arbitration for the final rules in the fall and winter. We had a surprise along the way, known as the 8th Circuit Court of Appeals. Got that stay in October and we're looking for a decision in April or May. But as it's turned out that may not be as important as we first thought, because the pace of decision-making, the number of decisions and especially their content in the hands of the state has worked out almost exactly as we expected and more importantly as we hoped for. So we're going to take a look at that now. And I want to tell you we're going to use a coverage metric here that goes by access lines. That recognizes that a decision in a small state isn't as valuable to us as a decision in a large state. And it begins by showing you that we have 98 percent of the access lines covered by either final negotiations in arbitrations or those that are in progress. We've done 81 percent complete. That comes out of nearly 50 arbitrations and that covers 120 million lines. We're going to finish up another 17 percent in 1997. That's some 30 odd arbitrations over 25 million lines. The two percent there are either exempt rural local exchange carriers or places that we don't think we need to be.

About half of that solid blue is on appeal to the district court. Frankly I think we'll make it all of the blue on one side or the other.

And only eight of these arbitrations are actually resulted in signed agreements with AT&T. That's because after you get the decision, you are sent back to the bargaining

table to implement principles and to finish the details, not always a quick task.

All right. If that's our coverage, how about our results? Well, the most celebrated issue in these arbitrations is always reselling. Reselling all or a piece of the local exchange carrier's services and networks. And there are two ways to resell under the act. One is the total service, that's what we call total service resale, TSR. And let's look at this one first because the act gave us the formula for the wholesale discount. It said you take the RBOC or the nonRBOC retail price back out of voided costs and properly applied to the FCC that ought to bring you out roughly in a range of 17 to 25 percent. How did we do here? First the RBOC territory. Terrific results, 91 percent of those lines are in or better than the FCC range. We're 102 million lines covered within that proxy range or a little better.

We've got five percent of six million lines underneath it. Utah, with seven or eight percent on the resale discount. And if you look at how these things distribute, you would see that we've got a major cluster there in the 20 to 22 percent range, and way out there on the right, take a bow to the national champion, the District of Columbia has a discount rate of 31.4 percent.

Quickly into GTE territory we've got another story going here. We have 52 percent of GTE lines where we've litigated in that discount range. 44 percent of the time we're out of it. That's about 7 million lines. If you live in California, Florida, Oklahoma, Ohio, you ought to be embarrassed.

Another way to resell, and one that figures prominently in our plans, is what we've been calling the unbundled network element. And here if anything we've got a better story coming out of the arbitration. First, everybody who has addressed the issue everywhere is giving us the full unbundling that the FCC called for in its August intercon-

nect order. That means we can get at the elements, at the features and the functions and the ILEC network piecemeal. That includes the vertical features of the switch. We can pick and choose what we need.

Second piece of real good news. Not only can we have them individually, we can buy the elements, put them all back together, create local service out of it, something we call the unbundled network element platform, UNE P. If you can remember that we'll speed up the presentation. But 92 percent of the lines coming out of these arbitrations are eligible for recombination in the way I described, and we will be appealing intensely Georgia, Tennessee, Louisiana and Alabama, where it is not permitted. Nice work Bell South, but you're going to get reversed.

All right. Next issue, what price for these unbundled elements? Well, more good news. Most of the decisions have come out in favor of a pricing methodology that uses long-run incremental forward looking costs. There are a few hybrids in the mix, but the nice part of this is no decision uses the embedded backward looking costs to price these network elements. Again, how are we doing? RBOCs first. We have 94 percent of the RBOC arbitrated lines covered by that forward looking cost methodology, and when you put that methodology onto the costs and the elements in the RBOC territory, it turns out that something like 74 percent of the prices—this is loop prices—come out near or below what the FCC eestimated would be the case when it issued its August order. These are called proxy prices and they were guesstimates based upon what the forward looking cost methodology would produce. Better pause and acknowledge the national champion, Illinois. 43 percent of the FCC loop proxy. You can get a loop in downtown Chicago for $3.72 a month.

Again, GTE, a little different, this is kind of an amazing story. We have 81 percent of those GTE lines have been arbitrated to use the forward looking cost methodology.

Let's put that cost methodology on the actual cost, going forward, and what do we get? Wow. Only 28 percent of the lines fall within that FCC proxy projection, something like 60 odd percent of the lines are outside it, makes you wonder whether they really are high cost. Also going to have to do something about some attempts to put non-recurring charges on us when we win customers in this manner. Those aren't cost based and we're in the process early this year of litigating any such charges back to cost.

Good news I guess is that the business case for using this unbundled platform is going to turn out to be a lot less sensitive to the pricing results than TSR. And that's where I want to move next. I would like to line up for you the economics of TSR on the one hand and unbundled network elements on the other hand in AT&T's strategy and business case.

We're going to start in the State of Pennsylvania, where like other places, TSR margins are modest. This is a good state for us. This is one where our wholesale discount is 25.9 percent. And when you stack the revenue next to the cost, you see that for a consumer averaging 20 dollars of local exchange service in Pennsylvania, we have a cost of goods sold of $14.81. Gives you a chance to market a combined local and long-distance package to this customer, gives you a fighting chance perhaps of recovering your marketing and billing and customer care costs incrementally to what you're already doing for long-distance. But it's tight. I guess what you say is it's a lot better than it used to be in Rochester where on that trial we have began to a five percent discount and the pink stack would have been 19 bucks.

But now let's look at the unbundled network element platform in the same state. We'll stay in Pennsylvania. Admit it's a good state for us. We're going to go into a high density, low Uni price zone. We're going to buy all the elements, recombine them to make global service out of the elements and assume we're doing this to a consumer that buys $25 of long-distance and five dollars of local

toll service per month. And now what we end up with, stacked next to it, is quite a different picture. Our cost of goods sold on that platform is $16.03, slightly above the TSR cost. But our revenue is $33.50. Consisting of that same 20 dollars in local that we collect and $3.50 in the interstate subscriber line charge, which under FCC rule comes to the provider under the platform, and 10 dollars worth of access, which was otherwise being paid to the local carrier on the 30 dollars of toll this customer was using. So we have widened our margin on the UNE P by more than twelve bucks over what we had on the TSR side.

Where this company assigns this margin, how you assess this business opportunity, depends upon what business you think we're in at AT&T. If you're a division that thinks your business is local exchange service, that is, you're after the 20 dollars, then you say, wow, I've got an all in, net cost of service that is defrayed by that extra revenue I collected, taking that away from the 16 dollars, I'm not paying more than 2 and a half dollars all in for the cost of goods sold to let me go chase the 20 dollars.

A little more accurate way of looking at our local business might say it's not local exchange. It's local network. We're going to change all the revenues that move over local network facilities. In that case I just bought a $33.50 revenue screen for $16.03 cost of goods sold, a discount of 52 percent. Or if you're in one of our sister divisions, say Gail McGovern's consumer long-distance, she might look at it differently. She might say, Good. For the same $16 that Harry Bennett paid to earn his 23.50 of end user collection, I just had my access reduced by $10. I improved my margin on a $30 toll customer by $10 because I don't have to pay access anymore outside the company. And Harry still has the distance between 16 dollars and 23.50 to recover his further costs, which is a 32 percent discount in and of itself. Or if you're Bob Allen you say, I don't care how you all allo-

cate those costs among the divisions, it's all mine. And what I see is a 53.50 cent revenue screen, we saved 30 dollars of toll revenue, we add 23.50 of local revenue, and we traded that crushing permanent access cost for a platform cost, plus a little bit of intercity transport cost represented by those yellow dots.

None of this by the way is to say that we can't make some business out of the TSR side of it. On the TSR side, you still have some very attractive long-distance customers, in this case the same $30 toll customer stacked up on top of that local revenue and that local cost. But now you're still paying access, which is why the pink bar goes up as much as it does. And you've lost your opportunity at 3.50 cents for the subscriber line connection recovery. Just another way of showing that your 13.50 better off on the right-hand side then you are on the left-hand side. And you know, this can go on for a long time. We could really have fun. How about a 75 dollar toll customer with five dollars of intrastate, intra-LATA toll? Now you move your cost of goods up to 19 dollars but you move your true local collections to 50. I'm dealing with a 64 percent discount, as you see, the higher the toll usage the more pronounced advantage of this platform. And you've got lots of room in there for some sensitivity around the existing costs and prices of the platform.

Having said all that, I want to suggest that none of this is the right way to look at the new AT&T's business. We are more than an all distance business. On top of that all distance stack of revenue we intend to add Internet service, information services, we intend to add anything that requires local connectivity. And we can do it without adding local connectivity costs. It's simply a matter of putting a couple extra pennies on the transport, but the basic connectivity platform stays there in the solid pink. It makes you look at our business in a different way. It's a two-fold business. We're local connectivity and its platform costs and anything and everything that comes after that connectivity.

Clearly there are huge advantages to that kind of business when you use the unbundled platform. It makes that local all distance service much more attractive, makes use indifferent to what happens in access for Interest, gives us an outlet for the new services, let's us work down the pink costs by replacing the RBOC elements with our own switch or our own wireless loop when the economists say so or when we want to differentiate our services. Frankly, all of us, you and the business are probably going to have to work on a different way to keep score. We aren't going to be able to allocate that connectivity cost among our businesses any more decisively and definitively than we've been able to allocate the cost of the local loop for 125 years in the industry.

Look, with all that opportunity, what are the public policy threats to AT&T's going forward business? One I hear most asked about is the eight circuit. And sure some national uniformity would be useful if we can get the FCC's jurisdiction restored in that appeal. But most of us are a lot less concerned than we used to be about what's going to come out of St. Louis. The first piece of the business model we've been looking at here, rest on the unbundling of network elements. And that's something that congress built into the new Telecom Act. That's not something the courts can say we don't want. Congress said, you got to have unbundling. So that's the law. And we feel pretty secure about that one.

The second piece of this model depends importantly on a principle that says, you don't pay access if you provide service over an unbundled element platform. Again, that's within the FCC's interstate access jurisdiction. That isn't a local entry matter. Probably that's not even properly before the 8th circuit right now. At least to the 70 percent of access that is interstate. And by the way, the 30 percent that is intrastate so far most of the states with only a few exceptions have gone along with the FCC rule and said no, you don't select intrastate access either when

you're providing a platform and not a per minute connection charge.

So what we ended up with in the 8th circuit was a lot of arguments over jurisdiction; fed or state. The state as it turns out did just fine without that preemptive federal jurisdiction. Perhaps it was seeing those results, perhaps it was doing the math on the platform. But the exchange carriers in the full argument added some substantive pricing challenges to their appeal. They say you can't use the combined elements for local, you can't use forward looking costs. That's unconstitutional or prohibited by the statute. It wouldn't be serious, at least more serious if we got a reversal on those grounds. But frankly the states did not join those challenges. The bulk of the argument has been on jurisdiction and we feel good about our chances on the substantive issues in the appeal.

Let me say here the biggest threat to this kind of business plan probably isn't public policy directly. The biggest threat is really implementation. Can we get at this stuff? Can we order it? Can the local exchange carriers provision it? What we have, incidentally, are the commissions doing their part again. 95 percent of the access lines are subject to orders that the local exchange carrier provide us with electronic interfaces for ordering and provisioning the elements and the service. Not only automated but at parity with the way the LEC provisions its own customers, through its own systems. We're getting the right rules in place about this, too, in the regulatory arena, but are the exchange carriers ever going to get us up and running? Well, we would say that depends in the first instance on incentive. And to show you the advantage of getting the incentives right, we have to return to the sad case of GTE, which illustrates the point for any nonRBOC territory. The Telecom Act didn't get it quite right here. They left GTE free to get into the long-distance business, even as it continues its local exchange monopolies, and they are accumulating customers rapidly. They have got no incen-

tives to cooperate with anybody else in getting those exchanges open. Quite the contrary, the longer they're closed the better it is. They're the most active challenger of the Telecom Act. They have some of the highest access rates, some of the highest element prices, some of the slowest implementation on the entry conditions. Frankly, we've got to do more than we're doing. At the moment we're waiting for the Telecom regulatory processes under the act to play out before we look at testing the that kind of behavior elsewhere, such as in the antitrust courts.

Are the RBOCs doing it any better? After all, these are the ones that have the incentives in the right place. How well can they be expected to perform? I tell you that's going to send us over to the third objective, which is to assure that we don't have long-distance entry before the RBOCs open those exchanges realistically.

This is a subject where the industry has spent a lot of words without necessarily advancing knowledge. So I'm going to try to stick to what we do know about RBOC entry. And it starts here. We know under the new act this is a four hurdle race, and these are the hurdles. First, you have to implement the local entry checklist, fully implement. Second, you've got to be facing some actual facilities competition for both business and residence customers. Then you've got to submit to a DOJ evaluation of conditions. And finally, you have to win the FCC's determinations that your entry to long-distance is in the public interest.

Now, three out of four of these hurdles, B, C and D, remain very speculative. How much competition is going to be required out there? We say nontrivial, everybody agrees. But you can't really look to the act to define it because it didn't.

What DOJ test is going to be used in their evaluation? We hope it's like the MFJ, that it starts with an analysis of whether there is uncontrolled market power locally.

How is the FCC going to weigh the public interest factors? We think that the FCC recognizes how important incentives are and how undermining it would be if premature entries were allowed to reverse the incentives. But at this stage, who knows. All I can do is argue the case and I'm not going to do it right now.

That's why we are spending most of our time working the first issue, the checklist. The checklist is much more granular. We know what it is. We know that it's not just an agreement to do it. It's not just a theoretic availability out there. It needs to be fully implemented. Those are the words of the Telecom Act.

For some of the conditions in that checklist, you get an obvious yes, no. The RBOCs know how to do it and you know when it's been done. It's like dial parity or number portability.

Others are just as important but they're proving a lot more difficult for both sides. And chief among these difficult items are these operating systems for ordering the TSR and the unbundled platform. That has shown up in the industry as a huge problem.

Automated TSR ordering right now is in the early stages. It's only a very few states. Automated unbundled element platform ordering is up and running in no state. Not a single state met the FCC's January 1, 1997 deadline for having the interfaces operational.

We are focusing the PUCs, the FCC, the DOJ on these issues. We're trying to establish metrics and standards where none exist. We've supported the creation of an industry coalition to attempt consensus on a set of quantitative measures that are based on really very common sense business needs. Can we order the stuff automatically? Will the exchange carrier accept the orders in the quantity we submit? Those the customer get service on time? Is the billing accurate? Does the service work? Can you get it fixed? Our view of success here is almost

exactly what FCC chairman Reed Hunt told the state commissioner in November of last year. Provisioning limits must not materially limit the flow of customers from the BOC to its rivals. And folks, the systems do that right now you're going to hear more about it tomorrow from our local service panel. For me, you're going to hear that having said all of what I just said, I still can't answer what you would most want to know about this issue. When do the RBOCs get in? Most of it please recognize is out of AT&T's control. We don't do the checklist compliance, they do. We don't make the public interest determination, FCC does. I can tell you the FCC and the PUC appear to be deadly serious about this. Ameritech Michigan demonstrates that. Ameritech relied on an unsigned AT&T agreement to show that the checklist was available. They didn't get to first base because you must actually be providing service under a signed agreement and neither of those conditions was true. Our position will be steadfast, fully implement that checklist, make big progress on access reform and show genuine competition and choice in your state. What does it mean for 1997 entry? I will say that on the current track no RBOC in our opinion is likely to meet the checklist and show enough competition to qualify for long-distance. They shouldn't get in.

Nonetheless, we've been promised a wave of applications in the second quarter of this year. Nobody ought to build a business on my prediction. So the prudent thing for us all to do is to be prepared just in case some of those applications slip through the net and we get premature entry.

I promise not to talk beyond what I know on RBOC entry. That's it, New subject, access.

This is a large dollar issue for AT&T. Domestically, which is what we'll take first, we're looking at somewhere between a 12 to 13 billion dollar bill. Our historical record on driving down access through public policy is good. I might even say great. There is the twelve year history.

And through a series of regulatory interventions and some smart network optimizing moves, we have moved the cost of access, conversation minutes, both ends, from 18 cents right after divestiture down to five cents on average right now. Even better, you will see that in 1995, the blue AT&T and the red everybody else crossed over, and we now enjoy a slight advantage over our competitors in regard to interexchange access.

But as we assess it, the traditional methods that got us that slope are beginning to run out of gas and still switched access is overpriced by seven or eight times. The local exchange carriers are collecting billions from the interexchange industry. The access charge has disguised the true cost of the service. They deliver a mass of undifferentiated subsidy that's impossible to target and it leaves the local exchange carriers with billions to turn right back on us in their competition in the future. For at least some of those reasons the 1996 act calls for reform. It demanded that any subsidies in these collections be made explicit, that funding be made competitively neutral, and that in our opinion anyway, charges for access be cost based. And that's why we're now in the midst of a very large FCC proceeding on reforming the traditional system. And I'm going to show you how AT&T argues its case in that proceeding.

Let's stay on the left stack, if you would, please.

I'm going to leave out the subscriber line charges. The exchange carriers collect something on the order of 7 billion directly from end users. The stack on the left is what the interexchange industry pays. And as we make it, starting from the bottom, there are to the nearest half billion we'll say there is two and a half billion of special access charges. These are dedicated circuits. Based on our idea of forward looking cost, there is another two and a half billion of actual cost based switched access in the stack. Then we would allow that for legitimate targeted universal service support, there needs to be another five billion dollars

somewhere in the industry. And all the rest, another ten billion dollars or so, is excess. We're going to call that subscriber line overpricing SLOP. So we've got ten billion of SLOP in the system. Our ideal income is the middle column. Our ideal outcome is the middle column. We'll sign up to pay dedicated access on roughly the cost causative basis that's now charged. We will pay on whatever rate structure makes sense the two and a half billion of switched access that we use, actually related to cost. We'll pay our part of the yellow, the universal service subsidy, although we think that under the act, the tax base here needs to be expanded. And that when we get some additional payors in the next—the yellow should go down at least somewhat as a burden on the interexchange industry. And the SLOP just ought to go away. It's excess, It doesn't relate to cost based pricing and its not needed for universal service support. It's just needed to cover inefficiency or what have you. And in consequence, we will flow it through in our long-distance charges, but in the end, the interexchange industry will be relieved of more than $10 billion worth of the burden that we now pay in our access charges.

Okay. That's what we argue. Realistically, as we come near the end of this proceeding, we have to acknowledge that it may not happen. A lot of people think that is too radical a move. Other people think it puts too much pressure on local rates. Not to worry. We are working a strategy that allows us to win under other combinations of reform which are out there in the right-hand column as a for instance.

First and foremost in that strategy is to make the access charges portable. Whoever wins the customer collection the access. That was the basis for the UNE P demonstration we went through. If you're a facility based carrier or a platform competitor, you don't pay act sells to the LEC. You collect it. Same for the subscriber line charge. You collect it, not the LEC, from the end user. And if you're serving one of the supported subsidized customers, you

collect the subsidy, too. Your share of the yellow. That is in fact what the FCC is now denominating incorrectly the market forces approach, but it is in their sights and frankly we have won the portability once in the local interconnect order. We feel good about that part of the strategy.

Second piece of the strategy, if you don't take ten billion of SLOP out, at least take a large portion out. Everybody agrees we're not paying cost based access charges. A minute of access is the same as a minute of local service and we know from those arbitrations that that minute costs less than half a cent, not the two and a half or three or four or five that we're being charged in access. How would you get some of that SLOP out there? I suppose you could raise the subscriber line charge or you could just have the RBOC suck it up and take it and look for more efficiencies. We might even see the FCC putting what's left of the SLOP on a per line charge to the interexchange carriers. But our position maintains—or continues to insist on a very large buoyant ante to the SLOP reduction.

Finally the third part of the strategy is surcharge for the subsidy for the yellow segment, whatever it is. We acknowledge here it might even go up. We're adding schools and libraries and rural health care facilities to the mix of supported customers under the new act. But even though it goes up or might go up, we could use some more payors like the RBOCs who collect the slick and have interstate corridor traffic and most importantly make it explicit and make it competitively neutral. That's what a surcharge on all the carrier's revenues would do. We won't then end up with a relative disadvantage at AT&T.

When that's all said and done, and whatever combination of elements you get in the right-hand stack, here is what we think it's going to mean. To the industry, we think that all the put and takes are going to leave us with something less than the 20 billion dollars of burden
